QUESTIONS FOR THE ASSISTANCE OF WITNESSES.

I.—FINANCIAL AID TO INDUSTRIAL ENTERPRISES.

1. Please state if you have had any experience of the raising of capital for industrial enterprises?

If so, what difficulties have you found in doing so?

What suggestions have you to make for removing these difficulties?

2. What are the sources from which capital for industrial enterprises is principally drawn?

2 (a). Can you suggest any new sources from which capital may be drawn?

3. Do you know of any kinds of industrial enterprises where more concerns have been started than can be maintained in full time employment?

If so, please describe the general conditions.

4. What is your knowledge or experience of financial aid by Government to industrial enterprises? Government assistance.

5. What are your opinions on the following methods of giving Government aid to existing or new industries:—

(1) money grants-in-aid;

(2) bounties and subsidies;

(3) guaranteed dividends for a limited period, with or without subsequent refund to Government of the expenditure incurred in paying dividends at the guaranteed rate;

(4) loans, with or without interest;

(b) supply of machinery and plant on the hire-purchase system;

(6) provision of part of share capital of companies on the same basis as public subscriptions of capital;

(7) guaranteed or preferential Government purchase of products for limited periods and;

(8) exemption for a limited period of the profits of new undertakings from income-tax; and exemption from any tax on an industry, or on any article used in an industry?

6. In which methods of Government assistance should there be Government control or supervision?

What should be the form of such control or supervision? (*E.g.*, Government audit or appointment of Government directors with defined powers for the period during which direct assistance lasts.)

7. What is your experience or opinion of Government pioneer factories?

Pioneer factor

[*NOTE*.—By pioneer factories are meant those established primarily to ascertain whether a new industry is commercially practicable?

By demonstration factories (see Questions 19 and 20) are meant those established primarily for giving demonstrations of, and instruction in, improved methods for industries which have been proved to be commercially practicable.]

8. In what ways and to what extent should Government pioneer industries?

At what stage should pioneer factories be either closed or handed over to private capitalists or companies?

What limits and restrictions, if any, should be imposed on the conversion of successful pioneering experiments into permanent Government enterprises?

9. In your experience what industries are hampered by the conditions under which they are financed as going concerns? Financing agencies.

Please describe the method of financing and its effect on the industry in each case.

10. In what ways is it possible to give more assistance to industrial undertakings by existing or new banking agencies?

10 (a). Do you think there is need of a banking law?

[See also question 39.]

11. Do you know of any industries which have been developed or assisted by the formation of co-operative societies? Co-operative societies.

What were the exact means adopted and what were the results obtained?

12. In your experience what are the industries for which co-operative societies should be encouraged?

What should be the organisation and special objects of these Societies?

12 (a). What suggestions have you to make for industrial development by means of Trade Guilds, such as exist in other countries?

How far should the State encourage the promotion of such Guilds?

Limits of Government assistance.

13. What principles should be followed in order to prevent Government aid competing with existing, or discouraging fresh, private enterprises.

14. Should there be any limitations on Government aid to a new enterprise if it competes with an established external trade?

II.—TECHNICAL AID TO INDUSTRIES.

Technical aid in general.

15. What is your personal knowledge or experience of technical and scientific aid provided by Government to industrial enterprise?

16. What is your personal knowledge or experience of noticeable benefits received by local industries from researches conducted by Government departments?

17. On what conditions should the loan of Government experts be made to private firms or companies?

Demonstration factories.

18. Under what restrictions and conditions would you allow publication of the results of researches made by a Government paid expert while attached to a private business?

19. Can you suggest any industry for which Government demonstration factories should be adopted and on what lines? (See note below Question 7.)

Research abroad.

20. Should any demonstration factories be instituted in your province?

21. What has been your experience of the aid afforded by the Scientific and Technical Department of the Imperial Institute?

What are its advantages and disadvantages?

22. In addition to arrangements made for research in India, is it advantageous to have provision for research for special subjects in the United Kingdom?

If so, for what special purposes is it advantageous to conduct researches in England rather than in India?

23. In what ways can the Advisory Council for Research in the United Kingdom give assistance to Indian industries?

24. Can you suggest for this country any system, similar to that of the Advisory Council for Research in the United Kingdom, for referring research problems to Colleges and other appropriate institutions in India? (See Questions 75 and 76.)

Surveys for industrial purposes.

25. Does the existing knowledge of the available resources of the country—agricultural, forest, mineral, etc.—require to be supplemented by further surveys?

26. How should such a survey be organised?

What should be its precise objects?

27. How should its results be made most useful to industries?

27 (a). What is your experience or opinion of the value of Consulting Engineers appointed by Government to aid industrial enterprise by technical advice and by the supply of plans and estimates?

(b) Should such Consulting Engineers be allowed to undertake the purchase of machinery and plant for private firms or individuals? If so, under what conditions?

[See Question 63 *et seq.*]

III.—ASSISTANCE IN MARKETING PRODUCTS.

Commercial museums.

28. What is your experience or opinion of commercial museums, in Calcutta?

29. If you think commercial museums should be developed and increased in number, what suggestions have you to make regarding their situation, arrangement and working?

Sales agencies.

30. What is your experience or opinion of sales agencies or commercial emporia for the sale as well as the display of the products of minor and unorganised cottage industries.

How should they be developed?

Exhibitions.

30 (a) Would travelling exhibitions of such industries be of advantage?

31. What is your opinion or experience of the value of industrial exhibitions?

32. Should Government take measures to hold or to encourage such exhibitions?

If so what should be the Government policy?

33. What should be the nature of such exhibitions?

Should they be popular in character, or should they aim merely at bringing sellers and buyers into contact?

34. Should trade representatives be appointed to represent the whole of India, in Great Britain, the Colonies and Foreign Countries? Trade representatives.

What should be the qualifications of these trade representatives?

How should their duties be defined?

35. In addition to these trade representatives would it be suitable in some cases also to have temporary Commissions for special enquiries?

36. Should provinces in India itself have trade representatives in other provinces?

How should such representation be arranged for?

37. Should the principal Government departments which use imported articles publish lists of these articles, or exhibit them in commercial museums? Government patronage.

38. With reference to the encouragement of Indian industries, have you any criticisms to offer regarding the working of the present rules relating to the purchase of stores by Government departments?

Have you any changes to propose in the rules themselves?

39. In what way is it possible to assist in marketing indigenous products by more banking facilities, either through existing agencies (such as the Presidency Exchange, Joint Stock and Co-operative Credit Bank) or through new agencies (such as Industrial and Hypothec Banks)? (see also Question 10.) Banking facilities.

IV.—OTHER FORMS OF GOVERNMENT AID TO INDUSTRIES.

40. What conditions should control the supply of Government-owned raw materials (e.g. forest products) on favourable terms? Supply of raw materials.

41. Is there any check at present imposed on industrial development in your province by the land policy of Government?

If so, what remedies do you suggest?

(NOTE.—The expression "land policy" is intended to cover laws and regulations relating to settlements, the Government assessment, rents, tenant rights, permission to use land for industrial purposes, and generally all matters connected with the ownership and use of land.)

42. On what principles should Government give concessions of land for the establishment of new, or the development of existing, industries?

43. What criticisms have you to make regarding the working of the present law for the acquisition of land on behalf of industrial companies?

What modifications of the law do you recommend?

43. (a) In what ways and on what terms can Government assist in the provision of subterranean or surplus surface water for industrial purposes.

V.—TRAINING OF LABOUR AND SUPERVISION.

44. (a) Do you think that the lack of primary education hinders industrial development? General.

(b) What has been done in any industry of which you have had experience to improve the labourers' efficiency and skill?

45. What steps do you consider should be adopted to improve the labourers' efficiency and skill—

(a) generally, and

(b) in any industry of which you have had experience?

46. What special knowledge or experience have you of the training of apprentices in factories and workshops? Apprenticeship system and industrial and other schools.

47. What advantages have you observed to follow from the establishment of industrial schools?

48. On what lines should these two systems of training (e.g., apprenticeship system and industrial schools) be developed and co-ordinated?

49. What has been your experience of day schools for short-time employees, or of night schools?

How should these be developed?

50. Should industrial and technical schools and commercial colleges be under the control of the Department of Education or of a Department of Industries?

What measures should be adopted in order that these two departments should work in unison in controlling industrial schools?

51. What measures are necessary for the training and improvement of supervisors of all grades and of skilled managers? Training of supervising and technical staff.

52. What assistance should be given to supervisors, managers and technical experts of private firms to study conditions and methods in other countries? (See Question 77.)

53. In what circumstances and under what conditions should industries assisted by Government be required to train technical experts?

Mechanical
engineers.

54. Is there a want of uniformity in the standard of examinations for mechanical engineers held in the various provinces where engineers in charge of prime movers are required in certain cases to be certificated?

If so, should measures be adopted to make such tests uniform so that the Local Governments and Administrations may reciprocate by recognising each other's certificates?

55. If the law in your province does not require any qualifications in an engineer in charge of a prime mover, have you any criticisms or suggestions to make?

VI.—GENERAL OFFICIAL ADMINISTRATION AND ORGANISATION.

56. What provincial organisation exists in your province for the development of industries?

What criticism have you to make regarding its constitution and functions?

57. What organisations do you recommend for the future development of industries in your province?

Should there be a Board of Industries?

If so, what should be the functions of such a Board?

Should it be merely advisory or should it have executive powers with budgetted funds?

58. If you recommend an Advisory Board, how should it be constituted?

59. If you recommend a Board with powers, what should be its constitution and how should its powers be defined?

60. Should there be a Director of Industries?

What should be his functions?

Should he be a business man, or a non-expert official, or a technical specialist?

What other qualifications should he possess?

61. If you recommend both the formation of a Board of Industries and the appointment of a Director of Industries, what should be the relations between the Board of Industries, the Director of Industries and the Provincial Government or Administration?

62. What form of machinery do you propose in order to correlate the separate activities of the various provinces as regards industries?

Is it practicable to form an Imperial department under a single head?

If so, what should be the functions of such a department?

Cottage industries.

62 (a). Should there be special measures taken or special sections of a Department of Industries organised for the assistance of cottage industries?

62 (b). Please explain in detail what should be the Government policy as regards cottage industries and how it should be carried into effect? In this connection, see especially Questions 11, 30, 64 and 72.

62 (c). What cottage industries do you recommend should be encouraged in this way?

VII.—ORGANISATION OF TECHNICAL AND SCIENTIFIC DEPARTMENTS OF GOVERNMENT.

General.

63. Are there in your province any technical and scientific departments which are capable of giving assistance to industries?

If so, what criticisms have you to make regarding their organisation?

What changes do you recommend?

Imperial department.

64. In order to aid industrial development do you recommend the formation of any new Imperial Scientific and Technical Departments?

If so, for what subjects or natural groups of subjects?

65. How should such an Imperial department be constituted and recruited?

66. What should be the powers of the head of the department?

If he has executive control of the department, what should be his relationship to the Imperial Government?

67. What should be the relationship of an expert, whose services are loaned by the Imperial department to a Local Government, with the Local Government and the latter's Department of Industries?

Provincial Departments.

68. For what subjects should Local Governments engage their own experts or organise their own technical and scientific departments?

69. Under what direct control should these experts and departments be placed?

70. On what terms should these experts be employed?

Technological institutions.

71. What is the most suitable way of developing technological research institutions, such as the Indian Institute of Science?

71 (a). Should there be a Technological Institute for each province, and should such Institutes be allowed to develop as independent units or should they be fitted into a general development scheme for the whole of India, with a central Research Institute?

72. As regards investigation and research should each Institute be general in its activities and interests, or should each deal with limited group of related subjects ?

73. Should there be any Government control ?

If so, should this control be Imperial or should it be purely provincial or local ?

74. Is it desirable that measures should be taken to co-ordinate and prevent unnecessary Co-ordination of overlapping of the research activities in Government Technical and Scientific Departments, research, special Technological Institutes and University Colleges ?

If so, what are your suggestions ?

75. What noticeable results have followed from the institution of the Indian Science Congress ?

76. Can you suggest any ways in which the Congress might become more useful in assisting industrial development ? (See Question 24.)

77. What encouragement should be given to Government technical and scientific experts Study of foreign methods. to study conditions and methods in other countries ? (See Question 52.)

78. What difficulties have you experienced in consulting technical and scientific works Reference libraries. of reference ?

79. Have you any suggestions to make regarding the establishment of libraries of such works ?

80. Do you think that the establishment of a College of Commerce is necessary in your Colleges of commerce. province ?

If so, on what lines should it be organised ?

81. In what ways do you expect such a college to assist industrial development ?

81 (a). In what ways can Municipalities and Local Boards assist in promoting industrial and commercial development ?

VIII.—GOVERNMENT ORGANISATION FOR THE COLLECTION AND DISTRIBUTION OF COMMERCIAL INTELLIGENCE.

82. Have you any criticisms to offer on the present system of collecting and distributing Statistics. statistics by the Director of Statistics ?

What changes do you suggest ?

83. Have you any criticism to offer on the present system of collecting and distributing Commercial intelligence. commercial intelligence by the Director-General of Commercial Intelligence ?

What modifications do you suggest ?

84. What advantages have you found in the issue of the " Indian Trade Journal ? " Industrial and trade journals.

85. Should Government establish or assist industrial or trade journals, either for general or special industries, which would be of real use to persons actively engaged in industries ?

86. What proposals do you make for the dissemination of information of this kind through the various vernaculars ?

87. What advantages have you known to follow the issue of special monographs on Other publications. industrial subjects or publications like those of the Forest and Geological Departments ?

What measures do you advise in order to increase the usefulness of these publications ?

88. Are there any other directions in which Government could collect and publish information of a kind likely to assist industries and trades ?

IX.—OTHER FORMS OF GOVERNMENT ACTION AND ORGANISATION.

89. Are there any products for which a system of Government certificates of quality Certificates of quality. should be established ?

For what products should such certificates be compulsory, and for what products voluntary ?

90. What should be the organisation for testing each class of products and granting certificates ?

91. Are there any classes of materials for manufacture or of manufactured articles for the Prevention of adulteration. adulteration of which penalties should be imposed ?

92. For each such class of goods what organisation do you suggest for purposes of inspection and prosecution of offenders ?

93. Have any other suggestions to make in regard to the prevention of misdescription Misdescription. of goods generally ?

94. What is your opinion on the present state of Indian law relating to marks and Trade marks and descriptions of proprietary and other articles of trade ? trade names.

95. Have you any criticisms or suggestions to make regarding the existing law and Patent laws. regulations relating to patents ?

- Registration of partnerships.** 96. Is it desirable and practicable in the interests of trade, to introduce a system of registration or disclosure of partnerships?
- Roads, railways and waterways.** 97. To what extent does the lack of transport facilities by road, rail or water hinder industrial development in your province?
Have you any specific recommendations to make?
98. Have you any criticisms to offer regarding railway freights, the classification of goods, the apportionment of risk, and the regulation of rates?
What are your proposals?
99. Are there any railway extensions necessary in your province to develop new or to extend existing industries?
100. Similarly, are there any waterways which should be constructed, extended or improved?
- Shipping freights.** 101. Are you aware whether the external trade or internal industries of the country are handicapped by any difficulties or disadvantages as regards shipping freights?
Can you suggest any remedies?
- Hydro-electric power surveys.** 102. What has been done in your province towards ascertaining the possibilities of developing hydro-electric power?
Should further investigation be made in this matter?
- 102(a). Have you any criticisms to make regarding the effect of the Electricity Act on industrial enterprise?
- Mining and prospecting rules.** 103. What difficulties have been experienced in the working of the Mining and Prospecting Rules (1913)?
104. Are there any minerals that are essential for industries of Imperial importance that ought to be developed at public expense? (*E.g.*, minerals of direct importance for the manufacture of munitions of war, or minerals ordinarily obtained in commerce from one country only).
- Forest Department.** 105. From the point of view of industrial enterprise, have you any criticisms to make regarding the policy and working of the Forest Department?
What suggestions do you make.
106. What measures are practicable to reduce the cost of assembling raw forest products?
107. To what extent is it practicable to concentrate special kinds of these in limited areas?
108. What noticeable deficiencies in forest transport are known to you?
What suggestions do you make for their removal?
- Jail competition.** 109. Have you any complaints to make regarding competition by jail industries?

X.—GENERAL.

110. What suggestions have you to make for the development of any industry in which you have been actively concerned or interested?
111. Does your experience suggest to you any new industry for which India seems peculiarly suited on account of its resources in raw materials, labour and market?
112. What supplies of raw materials are known to you of which the use in industry or trade is retarded by preventable causes?
What are these causes, and how should they be removed?
- 112(a). Have you any suggestions to make regarding the utilization of waste from raw materials?
- 112(b). Have you any suggestions to make regarding Government aid in the improvement of raw material, such as, cotton, silk, sugarcane, etc.?
- 112(c). What industries in the country are dependent on the importation of raw materials and partly manufactured articles from abroad?
113. Do you know of any supplies of raw materials for which there is a good case for investigation with a view to their development?

Evidence taken by the Indian Industrial Commission, 1916-17.

CALCUTTA.

WITNESS No. 78.

MR. H. G. GRAVES, *Controller of Patents and Designs, Calcutta.*

WRITTEN EVIDENCE.

Note on patents and inventions in India.

The number of patents applied for, and kept in force, despite the necessity for the payment of annual renewal fees, is a rough measure of the inventive power of the people. Confessedly, India has a low standard when judged in this fashion, but of course this aspect of invention, under which the inventor is enabled to obtain a monopoly by patent law, does not apply to the great advances made in irrigation, jute and so forth in this country. Taking applications from residents only, one application is made by every 2,000 applicants in the United Kingdom, 1,400,000 in India and 16,000 in Calcutta. In addition to applications by inhabitants a considerable number are made by foreigners and they are partly of a speculative nature, partly with a view of real working in the country, and partly to prevent or control unlicensed import of the patented articles. Probably the last reason is the most important in India where foreign, as compared with indigenous applications, were about equal in 1893 but bore a ratio of 5 to 2 in 1913. The war put a temporary stop to this increase of foreign patents, but it will be resumed and will continue for many years, as, under the present conditions of manufacture, India depends on foreign sources for new inventions. Nevertheless there are powers under the Indian Patents and Designs Act, 1911, for acquiring compulsory licenses, and for the revocation, of patents not worked in the country, so that manufacture need not be unduly hampered in the future. A special Act also deals with war conditions.

Apart from questions of novelty, the grant of a patent and its continued existence up to the ordinary limit of 14 years depends on the payment of initial and annual fees, which are as follows:—

In India Rs. 40 followed by payments of Rs. 50 annually for the 5th to the 9th years and Rs. 100 annually for the 10th to the 14th years—a total of Rs. 790.

In England, £5 followed by payments £5, £6, and so on up to £14 for the 5th, 6th up to the 14th year—a total of £100.

In consequence patents are generally allowed to expire when they are unsuccessful or unremunerative, but there are exceptions founded on sentiment, hope of better things, or something akin to blackmail. On the whole, however, the life of a patent is a measure of its value.

The annexed table shows the number of applications for patents in India and the number of patents alive on December 31st, 1915, differentiating between persons bearing Indian names, others resident in India, and foreigners.

The figures are too small to allow of any large deductions, but it may safely be said that the bulk of the inventions patented by Indians in the past are not of much value as a rule. There has, however, been an increase from 30 or 40 twenty years ago to 60 applications at the present time and this is a hopeful sign.

Inventions by other residents in India include those by Anglo-Indians and those by imported engineers. Curiously enough the numbers have remained about stationary in the neighbourhood of 135 annually for the last twenty years, although manufacture has increased so greatly during that period. Mainly this is to be accounted for by the fact that possible inventors are so engrossed by administrative and executive work, by running the works and looking after labour and the market, that they have no time to work out the details of an invention. If anything does occur to them, the tendency is to submit it to the manufacturer abroad, who can either supply improved machinery without investigation or else has facilities for embodying the idea in practice. Until India ceases simply to use machinery and really starts to manufacture it, this state of affairs will continue for one or two generations more. This view is supported by the increasing number of patents granted to foreigners, so many of which can only be for restrictive purposes. Many of these may be regarded as specially selected in view of the expense. Taking this fact and the different rates of renewal fees in India and England into consideration, the average life of the run of patents is fairly equal.

Although the numbers are so small, it may be of interest to note that the 54 native and the 196 "Anglo-Indian" patents alive and dating from 1901 to 1911 originated as follows:—Bengal including Bihar and Orissa 9 and 77; Bombay 22 and 40; Punjab 7 and 20; United Provinces 6 and 20; Madras 9 and 18; Burma 0 and 18; elsewhere 1 and 9.

In a few respects India has originated new inventions, *e. g.*, many railway signalling devices peculiar to the country; the Vandyke process of reproducing drawings—a method of world-wide use; the "limpet" washer for bolts holding corrugated iron roof which probably is little heard of because it has not been widely advertised.

Apart from what may be called modern machinery, India has devoted much attention to inventions for punkah pulling machinery, sugarcane mills, water lifts and handlooms. The first is practically dead, killed by the centrifugal fan. The old wooden sugarcane crushing mill was largely replaced, about 30 years ago, by the iron mill, introduced by a pushful and advertising manufacturer; but these improvements practically stopped and modern sugar machinery is not employed as it should be; in part this is due to questions of land tenure and difficulties of raising capital.

Water lifts are very attractive to local inventors but they seldom seem to know what is being done a hundred miles away and their ideas are elementary and not novel. The many forms in use are fairly economical and could best be improved by spending a few rupees on a more solid construction to avoid losses due to bending and friction; but co-operative irrigation from wells, by an engine and gang pumps, is much more promising.

Handlooms as now used in India are susceptible of enormous improvement and a very great deal has been done for the spinning and weaving industries by the schools which have sprung up during the last ten years. Even with all these improvements, such as the wider introduction of the well known fly shuttle, it is doubtful whether the hand industry will long withstand the factory, in spite of the help given by the excise duty which the factory is so anxious to abolish. Hand spinning is practically extinct beyond recall. The knowledge of hand weaving is intensely localized and both weavers and cloth merchants are intensely ignorant of known machinery. It is questionable whether the schools are even faintly aware of what really was done with the hand loom all over the world both before and after the power loom was introduced, even to the extent adumbrated in the Encyclopædia Britannica, but that does not prevent a would-be patentee from trying to get a monopoly for such old ideas as a change box for multiple shuttles, or an elementary form of draw-boy for lifting the warp threads for pattern weaving.

It is fairly clear that invention in India, in the sense of the Patent Act will not generally be a source of wealth for many years to come. The majority of men who now could invent are too busy with administrative work and the working classes include but few men who really can think of improvements and put them into practice like the skilled artisan in Europe or America. Meanwhile there is an enormous field for co-operation and for the saving of labour, a saving which lies not only in the extended use of appliances but also and even more importantly, in the proper direction of labour by "motion study" to eliminate useless, repeated and inefficient handling of material.

(a) Affected by war.

(b) Figures incomplete.

(c) First year of 1911 Act; renewal fees only began to fall due in 1916.

(d) Last year of 1898 Act; rush to obtain certain advantages under it.

(e) All patents before 1901 have expired

ORAL EVIDENCE, 27TH NOVEMBER 1916.

President.—Q. How long have you been in charge of Patents in India?—A. About 18 years.

Q. Before that for how many years were you in the Patents Department at home?—A. About 20 years.

Q. You say that "there are powers under the Indian Patents and Designs Act of 1911 for acquiring compulsory licenses and for the revocation of patents not worked in the country." Has this power ever been used so far?—A. About half a dozen times.

Q. Are there any cases that you can regard as typical, that would convey to us any special lesson?—A. I am afraid not. The chief case of a license under this Act was in reference to the manufacture of salvarsan, or the import of it, but it is chiefly the import that is affected. No proposal was made to manufacture the material in the country. Another case was the license of a patent for a bottling machine for aerated waters. The number is so small that no typical instance could be given.

Q. What determines the condition for a patent to expire? You say "in consequence, patents are generally allowed to expire when they are unsuccessful or unremunerative." Is there any formal way by which they expire?—A. They drop out of existence. The man does not pay his fees any longer and so the patent ceases.

Q. Do you declare their death by notification in the Gazette?—A. Yes. A weekly notification is issued with a list of patents applied for, granted and expired. That is published weekly in the "Gazette of India." Then quarterly I issue a small magazine and yearly a journal containing a summary of all these.

Q. Do they sell at all?—A. Well, to a certain extent. The early ones are out of print now up to the 1912 issue, so I issued a consolidated list to take their place.

Q. Is that selling well?—A. Oh yes, I suppose I have sold about 100 copies during the last two years. A certain number of copies have also been distributed throughout India, in places where they can be inspected by the public.

Q. I wish to refer you to your analysis of the number of patents obtained or applied for from different classes and different provinces. Do you regard those figures as too small to draw any general conclusion?—A. Yes.

Q. In Bombay the ratio of Indians to Anglo-Indians is as 22 to 40, and Madras as 9 to 18, but there are smaller ratios elsewhere. Are these figures too small to draw any lesson from them?—A. They are only to be regarded as matters of interest.

Q. What system do you adopt in examining applications for patents? How are they examined by specialists?—A. I am the only specialist in the office, and I have to examine every case that comes in. About 700 applications per year come in on the average. I don't profess to know everything, but I do what I can. If I think there is a fair hope of finding anything that would conflict with the applicant's claims, I search through the English specifications and also the Indian specifications. The office is so small and the number of patents so small, and the income so small, that we could not afford a crowd of experts to make a search.

Q. Could you not have honorary examiners, who would take up special cases, on the understanding that you classified the cases after casual examination?—A. To some extent that was done in previous years. I used to refer any case I pleased to the Public Works Department or any expert I happened to know and paid a small fee of Rs. 30. But this was very unsatisfactory, because the person consulted had no material or knowledge on which to base a wide search. A limited search was almost useless in many of these cases. I have arranged certain things in the office that enables me to search with a certain amount of facility.

Q. Facility perhaps, but what about confidence?—A. Confidence, no.

Q. That is very fine for your office, but what about the public?—A. I do what I am to protect the public.

Q. You don't mean by this that your search absolutely guarantees novelty?—A. It is absolutely impossible to guarantee novelty. Somebody, I think it was Mr. Gavin Jones, upheld the American office in this respect. There was an article in an American paper dealing with two or three patents in America that had been revoked by the Courts as not being novel though they had been passed in the Patent office for what they were worth, and for their novelty as far as they could determine it. The writer was very bitter indeed against the Patent office over their laws in this matter. Not that I want to attack the American Patent office, because they have a wonderful system and search as far as they can; but it is impossible for any Patent office in the world to guarantee the novelty of patents.

Q. Admitting that search is never perfect, is it a fair assumption to make that in America, and also in Germany, search is fairly effective and certainly results in excluding a number of frivolous applications?—A. Yes, also in England.

Q. Do you think that the fact that there is fair confidence in a new patent has any effect on the industrial development of these countries?—A. I should think the validity of the patent does not affect industrial development so much as the ability of the man to put the thing on the market.

Q. Still if a patent were obtained in a country where the search was known to be effective, would it not be an encouragement either to the financial man or the man engaged in the industry concerned either to buy out the patent or to work it?—*A.* Yes, within limits, but the limits are very hard to define.

Mr. C. E. Low.—*Q.* In the case of patents which are used for restriction, *i.e.*, patents held by people who actually make an article and don't want other people outside their combination to make it, what practical steps can be taken in this country to get the powers to work that patent?—*A.* They could apply under the present Patent Act to the Governor-General in Council for a license to work under this patent or for revocation of the patent.

Q. Have any such applications ever been received so far?—*A.* No, except in respect of the enemy patents for salvarsan and other things I have already mentioned, there has been no other case before.

Q. You remember about four or five years ago, under orders from the Government of India, you sent from your office a number of papers to certain public institutions in other provinces of India showing the patents which had been taken up? Has that had any practical effect in any direction, so far as you are aware?—*A.* I cannot trace any marked results, as far as I know, but they have been utilized to a certain extent more especially in Bombay and Madras.

Q. Previous to that what did the Bombay people do to get hold of this information?—*A.* They go into the Record office there and the clerks put them on to the papers they ask for.

Q. Those papers were obtainable there then before these special orders were passed?—*A.* Yes.

Q. Now they are in public institutions?—*A.* In public institutions as well as in the Record office.

Q. Do you come in touch, in respect to patents, with technical institutions?—Do you hear from them asking for papers, or do you find any patents emanating from technical institutions; have they applied to you for any literature?—*A.* The fishery people in Madras have asked me several times and Dr. Harold Mann gets a supply from me of patent literature that he thinks would be of interest to his institute.

Q. Do the Madras enquiries suggest any practical results likely to come about, or were they merely unguided general requests for information by people who would not be able to make use of it?—*A.* The enquiries have not been with much point up to the present.

Hon'ble Pandit M. M. Malaviya.—*Q.* Is an Indian patent recognised outside India, so far as you know?—*A.* It is only valid in India.

Q. But a British patent is recognised in India and is valid in India?—*A.* No, the British patent only covers Great Britain and Ireland.

Q. And the patent of no other country is valid in India?—*A.* No.

Q. You say that patents are granted to foreigners, many of which can only be for restrictive purposes?—*A.* Yes.

Q. What is the restrictive purpose which they have in view?—*A.* To prevent people using or importing their patented article without their leave.

Q. For instance, an American inventing a machine may patent it here, and then no Indian can imitate or make it?—*A.* That is so.

Q. You say that the number of such patents is increasing?—*A.* Yes.

Q. And you also say that many of these may be regarded as specially selected on account of the expense?—*A.* I imagine that their patents are for machines that the holders think they will be able to sell in India, and so, on the off-chance of obtaining a market here, they patent them here, because if they did not patent them in India anybody in India can make those things.

Q. In your opinion many of these patents are obtained only for this restrictive purpose?—*A.* I think so.

Q. You say that there is power under the Patents Act for the revocation of patents not worked in the country. Do you know if that power has been exercised in any instance?—*A.* It has not been exercised, because nobody has thought it worth while.

Q. You say that probably many persons do not come to take out a patent because they are engrossed by administrative and executive work. May it not also be that they are not afraid that anybody may make these things in this country on account of the industrial backwardness of the country?—*A.* Possibly so.

Dr. E. Hopkinson.—*Q.* When you speak of "foreigners" in your evidence you include British subjects in the U. K.?—*A.* Yes.

Q. You speak of patents being taken out for restrictive purposes; I thought the object of all patents was restrictive?—*A.* That is so.

Q. I don't understand what is the point you wish to make of that, since the sole object of a patent is to create a monopoly?—*A.* It creates a monopoly by preventing anybody in the country from manufacturing, but they don't intend to manufacture themselves; they obtain the patent so that they can exclusively import.

Q. Is it not a fact that most patents taken out in India are taken out by foreigners with the object of preventing other foreigners from importing the patented article, and that the interests of India do not suffer in any way by that, unless the article is of such a nature that it can be manufactured in India. It only applies to a limited number of cases?—*A.* Generally that is so, but it prevents competition between two rival importers.

Q. Yes, but why should they go to the trouble and expense of taking out a patent unless it is with the deliberate intention of preventing competition. They are owners of inventions either in the United Kingdom or Germany or elsewhere, and their object in taking out a patent is to create a monopoly?—*A.* It is not wrong that it should be so.

Q. I don't see any other inducement except it be advertisement only.

President.—*Q.* I thought this system which was common in all countries was merely a recognition of international courtesy. If you don't allow an outsider to register patents here, they will not allow you to register patents in their country?—*A.* The original grant of a patent was made to anybody for the sale, making or working of any new manufacture within the realm. It was not for import only.

Dr. E. Hopkinson.—*Q.* It is making or using; that surely is the intention of the patents laws?—*A.* I think that it was not so in the early days.

Q. I think it has been the same. The point however that I want to get at is that you seem to think that in some way the interests of India are affected by what you describe as restrictive purposes. Is that avoidable?—*A.* Not at present.

Q. You have the machinery to enable you to cancel a patent for an article which can be made in the country and is not made?—*A.* Yes.

Q. And I don't know that the country can wish for anything more; is that so?—*A.* That is so.

Q. With regard to the search, I take it that the search is really made as a matter of efficiency in your own office?—*A.* I make searches as far as I can.

Q. When you find another conflicting patent, do you inform the patentee?—*A.* Yes.

Q. Can you amend an application?—*A.* Yes, I help them to do so in every way possible.

Q. Then you are the authority?—*A.* Yes.

Q. The specification is not published before the search is made?—*A.* No.

Q. And so no one can know of the application and no one can appeal before the Controller, as in England, against rectification?—*A.* Not until the specification is published, and then there may be opposition to the grant as there is in England.

Q. Do you hear the opposition?—*A.* Yes.

Q. Do you ever have cases of opposition?—*A.* Yes, I have about three or four in hand now.

Q. In these cases you are counsel and judge and jury; you make the search, suggest the amendments and decide the award?—*A.* I tell the applicant, as far as I can, all that is necessary to enable him to get his application into order, and then I am judge afterwards, as with the Controller at home between the applicant and the opponent in view of the additional matter brought forward by the latter after the publication of the specification.

Q. There is no provisional specification in India?—*A.* No.

Q. How long an interval elapses between the filing or the granting of an application, and publication?—*A.* About three weeks to a month.

Q. That, of course is very rapid?—*A.* Perhaps we are at cross-purposes here. First the application comes in, then it is examined and accepted or rejected by me, and the average time for that is three months. Then, if accepted, the specification is sent to be printed, that takes about three weeks, and then comes publication.

Q. Then about four months elapses between the application and publication?—*A.* Yes, in most cases, but if the case is not originally in order, it takes more time.

Q. There is no legal obligation that a patent must be worked in the country, as in Canada?—*A.* No.

Q. Does the patent expire with the expiration of corresponding foreign patents?—*A.* Not under the present Act; it did under the Act that was in force before 1912.

* *Q.* The Indian Act was altered to correspond with the British Act?—*A.* Yes.

Q. Are there any chartered patent agents in India?—*A.* There are three or four who call themselves patent agents, and do the chief part of the work in this country, but there is no chartered institute.

Q. If there was anything of that nature, don't you think it would give a great deal more confidence, as it does in England?—*A.* I suppose it would.

Q. You have no suggestion to make about it?—*A.* No, the business is so small.

Q. Has there been any patent litigation in India?—*A.* Yes, there is a small volume of it scattered about.

Q. Would you go so far as to say that a patentee, assuming that he believes he can establish his right to a monopoly, would fight infringers and would not be deterred by the

cost of litigation?—*A.* Yes, I think so. There is a case going on now in southern India over a handloom, and I am afraid the volume of litigation over that is something enormous, owing partly to the character of the parties to the case.

Q. The character of the parties, not of the case?—*A.* No. A Madrassé man has got a patent and another Madrassé man is infringing it.

Q. Would you say that patent litigation is unreasonably costly in India?—*A.* It is about as cheap as they can make it.

Q. It is not commensurable at all with what it is in England?—*A.* No, but there is more delay here, and less knowledge.

Q. I suppose the appeal lies to the High Court from the District Court and from there to the Privy Council?—*A.* Yes.

Mr. A. Chatterton.—*Q.* When a patent is granted in some foreign country, is that accepted as sufficient evidence of its validity for granting the patent in this country?—*A.* I think that good enough.

Q. When a patent is granted in England, Germany or America, has it to be filed contemporaneously here, or is an interval allowed?—*A.* It has to be applied for in India before the foreign specification is published here.

Q. The British Patent Laws do not apply to Native States, do they?—*A.* No.

Q. What Native States grant patents themselves?—*A.* Three do—Hyderabad (Deccan), Mysore and Marwar (Jodhpore), but there are very few patents granted in them.

Q. Suppose a man sets up the manufacture of machinery in a Native State, and then exports his machinery to British India, what would the patentees do in British India; can you bring a suit against the sale of the machinery in India?—*A.* Yes.

Q. Have you power to reject a patent on the ground that in your opinion it is of no practical utility?—*A.* Yes.

Q. Do you often exercise that power?—*A.* Sometimes, when I get a man trying to get a patent for perpetual motion. It depletes my records and saves him money.

Q. The utility of an invention is not considered in the British Patent office?—*A.* No.

Mr. C. E. Low.—*Q.* Have you any information regarding the conditions under which Government allows its servants to take up patents?—*A.* It grants a patent to any Government servant on the condition that Government has the free use of the invention; or on terms to be settled by itself.

Q. Are not a large proportion of the classes who would be likely to take out patents in this country Government servants?—*A.* Yes.

Q. Have you heard any complaints about the terms which Government gives to Government servants in taking out patents?—*A.* They fear the restriction, but when the restriction is put into practice they are reasonably treated.

Q. In a great number of cases where a Government servant happens to be in this country negotiations are taken up by the Government of India, but when he is on leave or in retirement when the patent is taken out, negotiations are carried on with the Secretary of State; have you reason to believe that the Secretary of State does not treat the patentee as well as the Government of India?—*A.* I think the treatment is perfectly fair.

Q. You don't think therefore that there is any fairness in the complaint that this has unduly restricted Government servants from taking out patents?—*A.* I don't think there is any restriction at all.

Q. That restriction or condition applies to all patents taken out by Government servants, whether based on knowledge arising out of their employment or otherwise?—*A.* Yes, and it is applicable to all persons whether they are Government servants or not, because under section 17 of the Act Government has the right to use any patent.

Dr. E. Hopkinson.—*Q.* That is exactly the same in the United Kingdom?—*A.* Yes.

Q. The Government have the right of user on terms, and those terms are settled by Government?—*A.* Yes.

Q. Do you know of a specific instance where Government have exercised that right, and arranged terms?—*A.* I don't believe it has ever exercised that right. It is in reserve, in case the man is unduly grasping, but Government, like other people, go into the open market and buy the patented article at market prices.

WITNESS No. 79.

MR. J. A. CHAPMAN, *Librarian, Imperial Library, Calcutta.*

WRITTEN EVIDENCE.

My experience has been gained as Librarian of the Imperial Library and as Principal, Government Commercial Institute, Calcutta, so that it could all be compressed into a statement in answer to questions 78, 79, 87, 88 and 80.

The question of libraries is one of (a) books, (b) access to books. There are collections of scientific and technical books in the libraries attached to the Forest, Geological and other Departments and such institutions as the Sibpur Engineering College. I may assume that all the books that should be got for these libraries are got, or rather it would be an impertinence that I should question it; and if it be not the fact, and that is witnessed to by some Geologist, Botanist, Engineer, or the like, then will be the time for a professional librarian to be consulted as to the remedy. His part would be, of course, to report as to the books published to persons competent to assess their value. Reference libraries.

It is when we come to an imperfectly organised department, such as the Co-operative Credit Societies Department, or when it is a question of the literature of a subject that it is not the obvious business of some department or college to collect, it is then that the books themselves are not received in India, or they are, but in a public library such as the Imperial Library. Whenever we have (at the Imperial Library, I mean) clear proof that people depend on us for books of this or that class, as books on credit co-operative work, we get them, or we give information regarding them to the persons interested. Thus we give the Indian Tea Association information regarding Dutch books on tea-planting in Java.

Officers of the Surveys have free access to the Departmental libraries, and I may assume that any recognised Scientist would be given every facility to consult books. As a public librarian I am concerned with those European industrialists who do not belong to an organized body, such as the Tea Association, Indian industrialists (some of them, I gather, are shy of approaching a library known not to be a public library in the fullest sense), and the great mass of Indian students, the beginners, those who do not want merely access to books, but information as to what the books are, and advice as to what they should read. For these classes there is neither a sufficiency of books nor adequacy of indexing. The Imperial Library was organised as a literary, historical, and philological collection, and if it is more than that now, which it is, it is so more by accident than design. We have not bought many books on scientific and technical subjects, but we have been presented with considerable quantities, and having so begun to have collections of books of those classes, we have been led to add to them by purchase. We are still however very weak in those classes. The other public libraries that I have visited are weak too.

I would never suggest that the public should have free access to the departmental libraries, and it is hardly time, I think, for the suggestion that the public libraries should be placed in a position to spend much larger sums on books on technical and scientific subjects. *It is so common for the view to be held in India that there needs no more to make a library than that books be bought, that the last thing one wishes to do is to press for the addition of quantities to the existing quantities of unindexed books.* The advance that is obviously desirable might be secured by inter-borrowing and the compilation, on a common plan, of a card subject-index of the contents of the departmental and public libraries, and the maintenance of that index in each public library and by each University; possibly, too, of sections of it by the Chambers of Commerce. The Library of Congress subject-index in the United States, which owes its completeness as an index to the fact that so many books published abroad are registered for copyright in the States, is available for all the libraries. I want there to be such another index available in India, but, of course, not of books registered for copyright in India, but of books, etc., deposited in the Indian libraries. I take it that it is out of the question that our copyright law should be altered with a view to securing the deposit of foreign books with the Government of India for the registration of copyright. It is, indeed, a question whether such a change in the law would result in the receipt of many foreign books on technical and scientific subjects. Even in the States, if the number of registered German books of those classes is large, the number of English, French, Italian, and other foreign books is relatively small.

If there were maintained, at the Imperial Library in Calcutta, the Connemara Public Library, Madras, and elsewhere, a combined card subject-index of the contents of the principal libraries in India, and if inter-borrowing were permitted, all would be done, I think, that need be for the present. And if we had that index the authorities would for the first time be on certain ground in examining the question of the receipt of books in India. The index would show the classes of books in which all the libraries combined cannot show adequate collections.

The advantages that follow the issue of special monographs on industrial subjects and Government the publications of the Forest, Geological and other Departments would, of course, be increased by more scientific indexing in the public libraries. My experience has shown that it is not enough that the Geological Department, say, should publish an index to its Memoirs. In a backward country like India, and in a public library in this country, one must go a step further. One must combine such an index with all similar indexes and with one's own index of geological books. Otherwise people take one's own index of books to represent all that one has. They look up, say, "Marble," and see that we have such and such books on the subject, but they do not say.—"But there must be papers on marble quarrying among the Memoirs of the Geological Survey of India, the United States Geological Survey, and so forth, and of those sets there exist separate indexes." It would be part of the work of compiling a combined index of the contents of the libraries in India, that when an index to a set of Indian Memoirs is prepared, some copies should be printed on one side of the paper only, and spaced to be cut up.

I think the advantages would be further increased, were the Government of India to issue from time to time such leaflets as the United States Government Bibliographies of "Farmer's Bulletins", "Bulletins of interest to persons residing in cities and towns", "Roads—United States Government Publications.—For sale by the Superintendent of Documents," etc.

The experience I gained as Principal of the Government Commercial Institute is now a little out of date, so I will confine my remarks to one matter. It is that I regard it as absolutely essential that Government should see to the preparation of suitable books for Indian students in such subjects as banking, currency, the foreign exchanges, etc.

ORAL EVIDENCE, 27TH NOVEMBER 1916.

President.—Q. How long have you been in charge of the Imperial Library?—A. Six years.

Q. How many years have you been in Calcutta?—A. Nearly 16 years.

Q. So that your opinions are based on a fairly wide experience of Calcutta?—A. Yes.

Q. You say that you have not got many books on scientific and technical subjects. Do you get many applications for the use of such books?—A. What do you mean by "many"?

Q. In proportion to other books?—A. Say, 10 per cent.?

Q. I want to know what the percentage is if you can give it roughly. How do the figures compare with the requests for other class of books?—A. It has been a very small proportion hitherto.

Q. As regards making a general card subject-index of all the different libraries, would you propose to provide a staff for that purpose to go round to the other libraries and make a careful index of them?—A. I would have all the work done where the books are. If a particular book were in the Imperial Library, it would be indexed there. If there was a work in the Connemara Library at Madras, I would have it indexed there, and nowhere else.

Q. You would not trust to the local library to make its own index and provide you with the index cards?—A. I should; but if I found that there were cards that were of no use I would throw them away.

Q. I have never come across a library that was not understaffed. What is your experience?—A. They are all understaffed; but it does not take much longer time to index books well than to index them foolishly. And then men can be trained. I have now got a man from the Surgeon-General's Library and I am at present training him.

Q. Have you got a variety of staff—a variety of technical and other kinds of men?—Hitherto no.

Q. Would that be necessary in making such a card-index for subjects?—A. I do not think so. I often write to some one, or send a book to some one. You want in a library a man whose special business is the study of bibliographical methods, and he must have intelligence of course to know when he can index the books himself and when he must get some one else to do it for him.

Q. But would it not require a serious increase of your staff for this system of yours to be carried out?—A. Not very serious. We should need one more man at least for indexing. I do not think that the extra cost would be at all serious.

Q. You do not propose to disturb the constitution of the library as it is at present?—A. No. Not at all.

Q. What you really want is a sort of book census?—A. Yes.

Q. You make a suggestion that the Government should see to the preparation of suitable books for Indian students on subjects like banking, currency, the foreign exchanges, and other scientific and technical subjects;—books that would have a special application to this country. Do you think that this should be done by the Government and not left to private enterprise?—A. It is absolutely essential that Government should do it.

Q. For what special reason?—A. If left to private enterprise, as it has been hitherto, it is not done, or it is not done sufficiently well.

Mr. C. E. Low.—Q. What was the average budget provision before the war of your department for expenditure on new books?—A. We include books and periodicals under the same head. We had Rs. 10,000 a year.

Q. What does your staff consist of?—A. I am sorry to say that I have not the figures at my fingers' ends. There is the librarian, a head clerk, and about eight or nine clerks, a superintendent in the reading-room, and a number of sorters, a dozen dusting men, half a dozen coolies, etc.

Q. Are any of these men specialists in any subject at all?—A. No.

Q. Are they of the clerical type?—A. Entirely.

Q. Under what conditions are the public allowed to use the library?—A. People above 18 years of age may come and any one may borrow.

Q. And take the book away with him?—A. They have to give security if asked to do so—a deposit of money.

Q. I presume they are not allowed access to the shelves?—A. No, except in the reading-room.

The catalogues and indexes are in that room.

Q. What policy do you pursue in purchasing books out of the proportion of the Rs. 10,000 allowed for that purpose?—A. I think it suffers, if I may say so, unconsciously, modification from time to time. We were intended to buy everything about India. Then we found that there were certain classes of books about India which we had in great numbers, e.g., books on *shikar* and we got tired of getting any more of them. If there is a request or a number of requests for a particular class of books, it inevitably means that we get rather more books of that class than we used to.

Q. Do you get specific requests from departments or officials including the departments of the Government of India to purchase certain particular books?—A. No, I ask some one to suggest a book or books of a class. They do not do it unless I take the initiative.

Hon'ble Pandit M. M. Malaviya.—Q. Have you any committee to help you in administering the affairs of the Library?—A. There is a council.

Q. Does it divide itself into sub-committees on different subjects?—A. It is a small body. It meets once a month.

Q. Who selects the book? Which is the authority which finally selects them?—A. I make a list of books getting other people, as a zoologist, a biologist, an engineer and so on, to help me, and I lay it before the council and they say, "get this," "do not get that," and so on. The council passes final orders.

Q. The number of your council does not seem to me to be sufficiently large to permit of sub-committees on different subjects being constituted?—A. By no means.

Q. How is this council appointed?—A. The Government appoints it.

Q. Is the number limited?—A. Yes.

Q. But it can be increased by the Government?—A. It could be. I hope it won't be.

Q. Can you give us an idea of the comparative number of books on literary, philosophical and historical subjects as compared with books on technical and scientific subjects?—A. Without notice I do not think such a question ought to be answered.

Q. I want just a rough idea. Will it be one-fourth, or half?—A. We have to decide what is to be our definition of a technical book to begin with.

Q. You have spoken of technical and scientific subjects in your note. Take it in the same sense in which you wrote it in your note?—A. I really could not put a figure to it.

Q. Not even an approximate figure?—A. I cannot give one; it might be grossly inaccurate.

Q. Have you a system of depositing a fee for taking out books generally or is a deposit to be made on every occasion?—A. A man leaves a sum for one year, or two years, or five years. A regular borrower gives us an amount, and we keep it until he leaves Calcutta, or ceases to come to the library.

Q. What is the amount?—A. It varies according to the number of books taken at a time, and also to their value.

Q. You say "I would never suggest that the public should have free access to the departmental libraries and it is hardly time for the suggestion that the public libraries should be placed in a position to spend much larger sums on books on technical and scientific subjects. It is so common for the view to be held in India that there needs no more to make a library than that books be bought, that the last thing one wishes to do is to press for the addition of quantities to the existing quantities of unindexed books. The advance that is obviously desirable might be secured by inter-borrowing and the compilation, on a common plan, of a card subject-index of the contents of the departmental and public libraries." Would you allow those who use your library to take away those books which you have borrowed from other libraries?—A. If the other libraries had no objection I should certainly. If it were their rule that books may be lent by themselves to borrowers, there would be no departure in principle if I were an intermediary.

Q. That might cause inconvenience and loss to those who wanted to use the library in the place where it exists?—A. Quite possibly. On the other hand they would get books from elsewhere which they would not get if there was no such arrangement.

Q. You do not think that each province is large enough to have a complete library of its own?—A. What do you mean by a complete library?

Q. A library such as would not put you to the necessity of borrowing from other libraries in the way you suggest, with more books on technical and scientific subjects, so that you may not be under the necessity of borrowing such books from other provinces?—A. I think it would need a very much larger expenditure on books.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You say that you were once the Principal of the Government Commercial Institute?—A. Yes.

Q. What do you say about the establishment of a College of Commerce for the province? Will it be beneficial to the people or not?—A. It would depend upon so many things. It would depend so much, for one thing, upon the staff you got.

Q. With proper staff, we want to know your experience as the Principal of the Commercial Institute?—A. As long as you have in the matriculation examination one for which *all* the boys in the schools with a few exceptions are prepared, and for which they are sent up, and as long as you have a university like the University of Calcutta which says, "let them all come," you have a difficulty in getting any one, at least this is my experience, to look at anything else. A definite thing like the Civil Engineering College at Sibpur of course becomes established, and the Medical College becomes established. An indefinite thing like a College of Commerce would be, in my opinion, difficult to get people to consider seriously. You would probably have to conduct it for some years under the depressing influence of the thought that you had not as many students as you would have liked to have, and that they were of very inferior quality; that they were dregs from elsewhere. I had only one student whom it was really a pleasure to teach. His father was so miserably poor that he could not send him anywhere else.

Dr. E. Hopkinson.—Q. Is there anything to prevent your incorporating the index of the publications of the Geological Survey in your catalogue?—A. No, but I have been very busy so far, and have not yet had time. I simply want a staff.

Q. Have you suggested the method of printing the index on one side of the paper?—A. No. I propose to suggest a conference of librarians some time, and then to have these things discussed.

Q. With regard to the Government Commercial Institute, is the school still in existence?—A. Yes.

Q. You say that it is essential that suitable books should be prepared on such subjects as banking, currency, the foreign exchanges. Do you suggest that there are books which are unsuitable or there are no books at all?—A. I do not know of a book that you can compare with many books of the kind published at home, intended to be used by young men. I do not know of any such book published in India, dealing with Indian banks. One has to fall back on books about British banks and joint stock banks at home.

President.—Q. Do you mean to suggest that it is hardly time for the proposal that public libraries should spend much larger sums on books on technical and scientific subjects?—A. It is a question of spending *much larger* sums.

Q. Do you mean a sum like Rs. 3,000 a year in Madras and about the same amount in other towns of the same size, and ten times that amount in Calcutta?—A. I should say twice that amount (Rs. 3,000) for Calcutta. It would not be a waste if the books were bought for a library that was properly organised. Few Indian libraries are yet properly organized. There is, for instance, a great deal that is of value in, say, the library of the Surgeon-General; but I do not think it could be said that that library has been properly organised. We transferred certain medical publications which we received to it. I went the other day to find what had been done with them. They had done nothing; so I suggested that I should take them all back, and index them, and catalogue them; and that I should let him have a copy of our index, which would be placed in some conspicuous place in his library.

Q. Do you suggest that there is a certain amount of carelessness with regard to the use of libraries in India?—A. I think they are neglected, and not used as they should be. I think there is a great deal of great value in them. It is not that the libraries are neglected, because there is nothing very much worth while to go for in them. I think there is a great store of good books in India; but that it is not used, and that because it has not been indexed properly.

Q. Are you of opinion that if the libraries were properly stocked, indexed and properly cared for, the people would take advantage of them?—A. Certainly, yes.

Q. Are you judging from the experience of your library?—A. Our figures show a very steady increase in the number of books called for and given out in the reading-room. They go up steadily with each addition to the organisation and improvement in it. Putting a new catalogue in the reading-room seems always to have that result. That is very encouraging.

Q. Perhaps this modifies your suggestion that there should not be larger sums spent on books on technical and scientific subjects. If existing libraries were properly cared for, would they not be of more use and therefore do more good?—A. Undoubtedly yes. One does not want to suggest a larger expenditure on books, when what libraries cost in the way of cataloguing and indexing and so forth is so little recognised. It seems to me in India people think that a library is all right if there is some kind of clerk in charge.

Q. I quite agree with you about that. We want to be quite sure about this specific proposition, that if they were properly stocked, properly cared for and properly indexed, they would be of greater use in your opinion. Would you modify your written statement to that extent so as to make it complete?—A. Yes, when the proofs come to me.

Q. Have you got a copy of your annual report?—A. I have got a proof of the last one. It is in the press.

Q. That will show us the number of attendances at the library and the number of times that books have been borrowed and so forth?—A. It gives a great deal of information under these heads. I shall send you a copy of the report.

Hon'ble Pandit M. M. Malaviya.—Q. What is the total number of volumes that you have?—A. About 800,000.

Q. Have you given any special attention to technical and scientific subjects as you have given to literary subjects?—A. We pay due attention to scientific subjects. Each year we ask a geologist, a botanist, physicist, chemist, and so forth, to recommend books; but when you come to technical matters, such as welding, aeroplanes, or the like, we do little or nothing. If I see a book on jute that I think nobody else is likely to buy because it is in German, and think that some one would like to hear of it, I get it.

Q. So far as the recommendations of these geologists, botanists and other scientists are concerned, what is the test you apply?—A. We get all they recommend unless they are far too many. I asked a man the other day to draw up a list of works in the Greek and Latin Classics, and he sent me a list of books which would cost £100. We shall cut it down. But if a chemist or geologist sends us a small list, we buy all the books as a matter of course.

Q. So far as the importance of any technical and scientific book is concerned, it is left entirely to the gentlemen who recommend them to your attention?—A. Yes.

Q. You do not take upon yourself to decide whether the book should or should not be got?—A. Not the books that they recommend.

Q. Except on the ground of price?—A. On no ground whatever.

WITNESS NO. 80.

MR. R. S. PEARSON, I.F.S., F.L.S., *Forest Economist, Forest Research Institute, Dehra Dun.* Mr. R. S. Pearson.

WRITTEN EVIDENCE.

NOTE.—In answering the questions, only Forest industries and Forest problems have been taken into consideration, as I have no experience of other industries.

I.—FINANCIAL AID TO INDUSTRIAL ENTERPRISES.

Q. 5.—(i) I am in favour of either the part share capital system or Government pioneering, in cases where the undertaking involves large initial capital, as for instance, in developing the bamboo or elephant grass paper-pulp industries. The profits for a stated period to be divided between Government and the company in proportion to the capital supplied by each party. At the end of the fixed period the company to have the option of buying out the Government share and Government of charging a royalty on the raw product exploited from the Forest. Such an arrangement only to be undertaken in the event of no reliable company coming forward to undertake the business entirely on their own responsibility. Government assistance.

(ii) In the case of smaller enterprises, or in the case of established industries which are capable of improvement by the introduction of more up-to-date methods of working, such as, for instance, the palmarosa and lemon grass oil industries, or the collection and retting of forest fibres, or again the expression of oil from seeds of forest trees, which are at present worked on most primitive lines by petty contractors, the supply of machinery and plant on the hire-purchase system would perhaps be the best way of giving assistance.

Q. 6.—(i) Were the proposals suggested in answer to question 5 (i) adopted, Government should be at liberty to depute an officer to (a) inspect the companies books, (b) the factory and (c) have a representative on the Board, as long as they had an active interest in the undertaking.

(ii) In the case of plant which has been issued by Government on the hire-purchase system, only nominal supervision is necessary, as the purchaser will see to it that the plant in which he has a direct interest is not wantonly damaged. On the other hand any technical assistance should be rendered, if desired.

(iii) In certain cases it might be necessary to appoint Government Directors with definite powers to guard Government interests during the period in which direct assistance was being given; on the other hand I am very much in favour, when possible, of reducing Government supervision to a minimum. Once Government have decided to adopt a stated policy in connection with any industry and have satisfied themselves that the firm or company with whom they are going to co-operate is a reliable one, the undertaking should be left to that company to be run on commercial lines.

Q. 7.—My experience in connection with pioneer factories is limited to that of the Government Rosin and Turpentine Factories in the United Provinces and the Punjab, to the erecting of *Pinus longifolia* sleepers in the United Provinces and to a very limited extent to the Government Tan-Extract Factory in Rangoon. I have no experience of demonstration factories. Pioneer factories.

Q. 8.—Under certain conditions pioneering work by Government will, without doubt, be necessary and advisable. It must be remembered that practically all extraction of forest produce had as a commencement to be carried out by departmental agency, and it is thought that this will be the case in many new ventures in the future. The conditions under which such pioneering work should be carried out are, when no company is willing to undertake the work, either on the part-share system or by obtaining a lease from Government.

The stage at which a pioneer factory should either be closed or handed over to a company, cannot be fixed with any certainty, it must depend on the nature of the venture. In any case a pioneer factory should not, in normal cases, continue to be under the control of Government after a second factory has been established by a company and is in working order.

II.—TECHNICAL AID TO INDUSTRIES.

Technical aid in general.

Q. 15.—I have been for seven years in charge of the Forest Economist's office, during which time my duties have been to carry out investigations either instigated by companies and private persons or by the Forest Department, of which the most important enquiries will be stated hereafter in answer to questions 16, 110 and 111.

Q. 16.—The Forest Research Institute has been instrumental in assisting the match, pencil, teabox, bobbin, rosin and turpentine, rosha and eucalyptus oil industries, in placing consumers in direct touch with the local forest officers and timber contractors, and in starting the business of treating timber, especially railway sleepers and in carrying out investigations as to the value of bamboos and elephant grasses for paper pulp, in co-operation with pulp and paper manufacturers in India. Many other investigations have been carried out in some of which companies are now commencing to take an active interest.

Q. 17.—Only in very exceptional cases should the loan of Government experts be made to private firms or companies, the work can generally be carried out at a Research Institute as a general enquiry.

Research abroad.

Q. 21.—We frequently submit samples to the Imperial Institute for valuation, latterly with more useful results. It is not an entirely satisfactory arrangement as it does not result in our getting into touch with firms at Home, the names of which are rarely, if ever, mentioned by the Imperial Institute in their reports. Results were anything but satisfactory on the only occasion on which arrangements were made with the Imperial Institute to handle a consignment of timber (sandal wood from Coorg) as a trial parcel to be sold direct on the English market.

Surveys for industrial purposes.

Q. 25.—We have a fair idea as to the outturn of our principal species of timber, but very meagre data as to the outturn of the other species or of the majority of our minor products, many of which are of recognised value. A complete survey of all forest resources would be of the greatest value. Such a survey cannot be carried out by the existing staff, as the local officers have already far more work to attend to than they can properly undertake.

Q. 26.—Such a survey could best be carried out by forming a Special Commercial Department in each Province, whose duties would be not only to carry out the survey but also certain other business, which will be dealt with hereafter, in answer to question 105.

Q. 27.—The object of such a survey should be to compile tables of the outturn of (a) timber and (b) minor products of present or prospective value, in each Forest District in British India, with notes as to facility of extraction, labour, and local price of the produce.

The publication of the above proposed tables through (a) local Directors of Industries, (b) through the Press and (c) a free circulation of copies of the tables to all industrial bodies, such as Chambers of Commerce, Associations, and large companies interested in forest produce.

III.—ASSISTANCE IN MARKETING PRODUCTS.

Commercial Museums.

Qs. 28-29.—A commercial Forest Museum forms part of the Forest Research Institute; other Forest Museums exist at Poona, Coimbatore, Pyinmana, Balaghat, and Kurseong, most of which have instruction as their primary object. The creation of Commercial Forest Museums at industrial centres is strongly advocated. Such museums should aim at commercial development and not be of a popular character. They should be run by the commercial staff of the Forest Department, the creation of which is advocated elsewhere in this note.

IV.—OTHER FORMS OF GOVERNMENT AID TO INDUSTRIES.

Supply of raw material.

Q. 40.—Of recent years the policy of Government has been to grant leases on favourable terms to companies for the extraction of raw forest produce, in connection with new industries. On the other hand it must be admitted that companies and private persons have been slow to take advantage of the obvious desire on the part of Government to help in this connection the initiation of new ventures, so that it seems fairly certain that Government will have to act as a pioneer in certain cases. The policy of giving leases on favourable terms has the drawback that it generally binds Government to an agreement for a long period, during which conditions invariably change and often in a way that is least expected. On the other hand financial aid, such as is advocated in the paragraph answering questions 1-5, is generally

fixed for a comparatively short period. In the event of financial aid not being desired, but a lease on favourable terms advocated, the first lease granted for a new industry should, in my opinion, be granted on favourable terms, such as non-payment until the factory is in working order, and after that on a sliding scale for a fixed period.

VI.—GENERAL OFFICIAL ADMINISTRATION AND ORGANISATION.

Qs. 57, 60 to 62.—(i) I am not in favour of appointing an Advisory Board but of creating posts of Directors of Industries in each province. To have an Advisory Board and a Director of Industries would make the machinery so cumbersome, that it would probably defeat its own object. It is possible that even the Directors of Industries might find some difficulty in keeping in direct touch with forest industries, as their sphere of action would generally be far removed from forest areas, but, on the other hand, this difficulty should be largely overcome by the appointment of a forest commercial staff.

From my limited experience in working with the Director of Industries, United Provinces, I consider that considerable advantages to forest interests would result from mutual co-operation, in other words that appointment of such officers would be likely to result in materially assisting the development of forest industries.

(ii) The Director of Industries should confine his attention to enquiring into the possibility of starting new industries, formulating proposals when the enquiries reach an advanced stage, assisting existing industries, answering enquiries, and publishing commercial statistics. I am entirely against laboratory research work being carried out by a Director of Industries. Such work should be carried out by a body of experts under central control.

(iii) The choice of Directors of Industries is largely a personal equation, and sound arguments can be put forward for the appointment of either a business man, an official or an expert, all of whom might possibly have desirable qualifications. It amounts to this that provided the man has powers of organisation, a fair stock of business qualities, tact and common sense he is likely to turn out a successful Director. An expert in some very specialised subject would in all probability be found unsuitable for the post.

(iv) I am absolutely against an Imperial Department under a single head, for the same reason that an Advisory Board and Director of Industries in one province is undesirable; the greater the number of offices and officials to deal with commercial problems, the slower will be the development of indigenous industries. One Director of Industries, supplied with an adequate staff of commercial assistants, will do more to attain the object in view, provided there exist competent experts to whom he can refer in technical matters, than the more complicated machinery which would come into existence by the formation of Advisory Boards and the appointment of Directors of Industries, backed by an Imperial Department, under a single head.

(v) To correlate the separate activities of the various provinces as regards industries, conferences should be held, at which programmes of work should be discussed and overlapping eliminated; moreover mutual co-operation should be introduced as far as practicable. I am not at all certain whether a limited degree of healthy inter-provincial competition in such matters would not be beneficial.

VII.—ORGANISATION OF TECHNICAL AND SCIENTIFIC DEPARTMENTS OF GOVERNMENT.

Q. 68.—(i) To develop the scientific side of the Forest Department, the Government of General India created, in 1906, a Forest Research Institute at Dehra Dun. The sections into which the work is divided are (a) silviculture, (b) botany, (c) zoology, (d) chemistry and (e) economy, the latter dealing with the development of forest industries and the marketing of both major and minor products, while the Chemical Adviser works in close co-operation with the Economists. The Institute is under the direction of a President, who is also President of the Forest College. The staff of the economic section consists of an Economist, Assistant Forest Economist (vacant at present), a Museum Assistant and clerical staff. The services of a Cellulose Expert and Tan Expert have been secured, but these appointments are of a temporary nature.

(ii) It is generally acknowledged that the numerical strength of the staff in the economic branch is inadequate and its composition anything but perfect. To expect one man to be expert in all the branches which are connected with forest utilization is to ask the impossible. It is necessary to have experts for each separate important branch of the subject and for this purpose the staff should be constituted somewhat as follows: (a) a head of the economic section, who besides direction should take up one branch subject, (b) a timber expert, (c) a cellulose expert, (d) a tan expert, (e) an expert in the antiseptic treatment of timber, (f) an expert in dry distillation of timber, including the manufacture of charcoal, (g) an expert in gums, resins and oleo-resins, (h) a specialist in other minor forest products and (i) a business man. As time goes on the staff would no doubt have to be enlarged by the addition of assistants, while the economic section should be under the orders of the President, Forest Research Institute, as at present.

Such proposals may appear to entail a larger staff than is necessary, but if reference is made to the staff in the corresponding section of forest economy in the United States of America (a copy of which is attached) it will at once be seen that the proposals are in proportion very moderate. In further support of this assertion it may be mentioned that at

Wisconsin, the staff of the forest economic section consists of from 80 to 90 men of which over 40 are experts, who have to deal with far fewer kinds of timber than are found in our Indian forests and in whose country, with the exception of pine resin, practically no minor forest products exist. Similarly, the chemical section of the Forest Research Institute is understaffed, and should be dealt with in the same way as that advocated for the economic section.

Imperial
Departments.

Qs. 64 & 67.—I am strongly in favour of Imperial scientific and technical departments for chemistry, botany, geology and zoology, from which men could be deputed for special work in connection with—as far as my department is concerned—forestry. Were such an officer deputed from one of those departments to Forest Research Institute, he should be, as far as details of work are concerned, under the orders of the President, Forest Research Institute, and Sectional Officer, that is, he should be lent to a department though his name would be borne on his own departmental list and his promotion regulated accordingly.

Provincial
Departments.

Q. 68.—If Local Governments engage experts of their own to investigate local forest problems, which in my opinion is very advisable, such officers should be affiliated to the central Forest Research Institute, at which place they should spend a portion of the monsoon months to work out the problems in which they are specially interested and also to keep in touch with new enquiries and with commercial development. Such officers, as a commencement, would probably have to be forest officers, until such time as a man from the commercial staff could be made available.

Technological
Institutes.

Q. 71.—All Technological Research Institutes should be fitted into a general development scheme for the whole of India, controlled by an Imperial governing body.

IX.—OTHER FORMS OF GOVERNMENT ACTION AND ORGANIZATION.

Forest Depart-
ment.

Qs. 105-106.—(i) The area in charge of the Forest Department amounts roughly to $\frac{1}{4}$ the total area of British India, or approximately to 245,612 square miles. The staff employed to manage and protect these forests consists of 234 trained Imperial and 295 trained Provincial officers. From these figures it will be readily understood that the officers in charge of such a large area have little or no time to do more than carry out routine duties, protect their forests and gradually introduce more scientific methods of management. Then again, the training given to those officers has largely been restricted to purely forest subjects, and relatively little time could be spared for such subjects as utilization and forest engineering, with the result that the tendency of officers when they come to this country, is to devote their energies to silviculture, management and protection, at the expense of the commercial side of the business.

(ii) To overcome these difficulties the creation of commercial and engineering sides to the Forest Department is advocated thus following the lines of railway administration, whose establishment consists of an engineering, a locomotive and a traffic staff. Were the above proposals accepted, the Forest Service should be divided into four sections, i.e., forest management, forest commerce, forest engineering and forest research.

(iii) The officers of the forest commerce section should be in charge of all sales of timber and minor products, department sawmills, demonstration factories, seasoning and treating plants, depôts and forest museums. They should also be responsible for the issue of commercial statistics, and form a link between the forest officer and the commercial world and with the assistance of the Forest Research Section work out schemes for new forest industries. It would obviously be impossible to hand over at once all the above duties to the commercial section. The introduction of such a scheme would have to be gradual and would be guided by further experience. The recruitment of the staff should be from men who had received a commercial training, backed by some commercial experience. It is thought that as a commencement it would not be advisable to have a large staff, probably one man per circle would be sufficient, though in such places where large depôts, Government sawmills, or pioneering factories exist, one or more assistants would be necessary. On the basis of one man per circle the staff would amount to approximately 25 men for the whole of India and Burma.

(iv) Mention was made above of a forest engineering side to the department. For many years the need of technical advice in engineering matters has been felt by all forest officers who have run up against engineering problems of extraction, either by land or by water. To overcome this difficulty the Bombay and United Provinces Governments have appointed engineers, as a temporary measure, to enquire into and assist in forest engineering problems. These steps are all in the right direction but are inadequate to meet the requirements of the case. One of the chief difficulties in marketing the so-called "Inferior Species" of timber is due to want of mechanical means of cheap extraction. To cite only one case in point, the Himalayan spruce and silver fir, which are very suitable for the manufacture of match splints, for boarding, planks, etc., cannot be got out sufficiently cheaply to allow of their being utilized, simply for want of proper means of extraction. This is but one instance, others will be mentioned hereafter in answer to question 108. The urgent need for Forest Engineers is equal to that for commercial men, in fact the appointment of the former staff is a corollary to that of the latter.

Q. 107.—The formation of plantations and the more concentrated working of the forests is a silvicultural question, which will no doubt be dealt with by the proper authorities. It is

of the greatest importance in connection with certain industries, such as match and pencil making, in which cases plantations might with advantage be created by the companies utilizing the timber, as well as by the Forest Department.

Q. 108.—A very long list could be prepared of cases in which forest transport is difficult, and no doubt particular instances will be supplied by local forest officers. A few specific cases which have come under my notice may be mentioned, *viz.*, (1) the difficulty in extracting timber, chiefly teak and rosewood from the felling areas to the Tavargatti depôt in the Belgaum Division, (2) the very indifferent floating facilities on the Kalanudi for the extraction of teak logs from Gund in the Kanara Division, both in the Bombay Presidency, (3) the slow and somewhat expensive methods of moving teak and other logs from the felling areas to the floating streams in many Divisions of Burma, which is now carried out by drag elephants, (4) the exploitation of the fine forests in the Jaipur Reserve of the Lakhimpur Division of Assam is at a standstill for want of mechanical traction, (5) the laborious methods of carrying and carting timber from the Melghat Division of the Central Provinces to the plains, where probably a rope-way would facilitate and cheapen matters considerably, (6) the difficulty in extracting spruce, silver fir and other timber from the Punjab and United Provinces for want of mechanical appliances. The question is asked as to how these difficulties could be overcome, and the answer without doubt is the employment of Engineers to enquire into and devise means of overcoming the difficulties in each individual case, which for want of time and in some cases experience also, precludes the work being carried out by forest officers.

X.—GENERAL.

Below is given a list of industries, the enquiries about which are either completed, or are in progress of completion or about which, owing to the supply of raw material available and the conditions of the market, an investigation as to the possibility of starting a new industry is thought to be justified:—

- (i) The manufacture of paper-pulp from either bamboos or elephant grasses. Suggested localities for the former industry are Burma, Arakan, Chittagong and west coast of India, for the latter, Assam, on the banks of the Brahmaputra and Monas Rivers, in the United Provinces, Bengal and possibly Burma.
- (ii) The introduction of permanent and portable sawmills, either to produce constructional timber especially of other than the major species or in connection with small industries, such as the manufacture of packing cases, turnery, furniture making, rough-cutting of felloes, naves, spokes, shafts, railway keys, tool handles, shingles, dry goods barrels, etc. It would probably be found necessary to erect a seasoning plant in conjunction with the sawmills, when working for special purposes, such as furniture making, wheel-wrights work, turnery, etc.
- (iii) The erection of antiseptic treating plants, especially in connection with the treatment of railway sleepers and mining props. The treatment of sleepers has a twofold object, *i.e.*, to supply the State and Company Railways with sleepers and to more fully utilize certain hardwoods for which at present there is only a limited demand. In this connection the manufacture of coaltar creosote is advocated as a new industry in India.
- (iv) The manufacture of three-ply boxes. Assam, Burma and the Andamans are probably the localities from which sufficient supplies of raw material could be obtained with which to start this industry.
- (v) The manufacture of both jute and cotton bobbins. A large demand exists for bobbins in Calcutta, Bombay, Cawnpore and elsewhere. Suitable timbers at reasonable prices have been found for the purpose so that there appears no reason why this industry should not be developed.
- (vi) The preparation of paving-blocks. The enquiry is in hand and provided the tests being carried out in Bombay prove successful, a new industry may arise in India. The experiment with *Sal* paving in Calcutta have not proved successful.
- (vii) The manufacture of bazar toys suggests itself as a village industry.
- (viii) The encouragement of the match industry, especially with reference to the utilization of Himalayan spruce and silver fir for splints.
- (ix) To further investigate the possibility of manufacturing pencils in India combined with the manufacture of pen-holders, rulers and other stationery requisites.
- (x) The preparation of ropes, twine, etc., from bast fibres of forest trees, shrubs and herbs, such as *Heliceres Isora*, *Sterculia villosa*, *Grewia* and *Ficus* species, *Trema orientalis*, *Wrena lobata* and others, might with advantage be encouraged as village industries.
- (xi) The manufacture of tan-extracts from mangrove bark. Large forests of pure mangrove or mangrove and 'sundri' *Heritiera minor* exists in Aracan, on the

Bassein coast, and in Tavoy and Mergui, whence large supplies are available. The possibility of preparing tan-extracts from myrabolans, *Terminalia chebula*, and from barks, such as that of *Acacia arabica*, *Xylia dolabriformis*, *Terminalia tomentosa*, *Terminalia paniculata*, *Shorea robusta*, *Anogeissus latifolia* and the leaves of the latter species is also worthy of consideration.

- (xii) The question of preparing rosin, turpentine and gum from *Boswellia serrata*, gum oleo-resin; a tree found all over the dry zone forests of the Peninsula, has been under investigation for four or five years at the Forest Research Institute. Most of the difficulties have been solved, and the products well reported on, while the financial aspect is also satisfactory so that an important industry may in time be expected to develop.
- (xiii) The extension of the *Pinus longifolia* rosin and turpentine industry in Kumaon and the Punjab, and to enquire into the possibility of starting a similar industry, working with *Pinus Khasya* in Government and leased forests of Assam and in the Lower Shan States of Burma.
- (xiv) The substitution of steam instead of direct-fire distillation in the manufacture of *rosha*, *lemon grass* and *citronella grass* oils.
- (xv) The production of 'khas-khas,' *Vitiveria zizanioides* and 'kuth' oil from *Saussurea Lappa* in the United Provinces and in Kashmir, respectively.
- (xvi) The extraction of oil from seeds of forest trees, for soap making, burning, cooking and for the conversion of liquid fatty oil into solids. Amongst other such seeds which deserve attention are *Taraktogenos Kurzii*, *Schleichera trijuga* and *Vateria indica*, about which considerable information has been collected, demonstrating their commercial possibilities.
- (xvii) The introduction of improved methods of preparing cutch and kath from *Acacia Catechu*, which enquiry refers to Burma, the United Provinces, Madras, and to a lesser degree to the Central Provinces, Bengal and Bombay.
- (xviii) Extension of the cultivation of lac and the introduction of improved methods of collection and preparation.
- (xix) The introduction of improved methods of manufacturing charcoal and combining this industry with the preparation of Stockholm tar in pine areas and of Wood tar where broad leaf trees are utilized.
- (xx) The preparation of *winter green oil* and natural salicylic acid from the leaves of *Gaultheria fragrantissima*, found in the Khasya Hills and said to be very common on the Nilgiris. (Gamble.)
- (xxi) Organization in collection and in some instances the cultivation of forest drugs, such as *Podophyllum Emodi*, *Strychnos nux-vomica*, *Aconites*, etc.

No. R. P. Z., dated 22nd August 1916.

From—The Director, Forest Products Laboratory, Madison, Wisconsin, United States of America,
To—The Forest Economist, Dehra Dun.

Your letter of June 26 is received. The Forest Products Laboratory was established at Madison, Wisconsin, in 1910, by the Forest Service of the United States Department of Agriculture. We have the co-operation of the University of Wisconsin to the extent of furnishing building, heat, light and power. The building was erected at an expenditure of about \$50,000 and the heat, light and power represent a cost of about \$6,000 annually. The laboratory equipment is available to the University for research and several lecture courses are given by members of the laboratory staff at the University; for example, on timber construction, wood preservation, wood structure, and chemistry of forest products.

The laboratory equipment valued at over \$100,000 was furnished by the Government, which also makes an annual allotment of about \$140,000 for salaries, maintenance, etc.

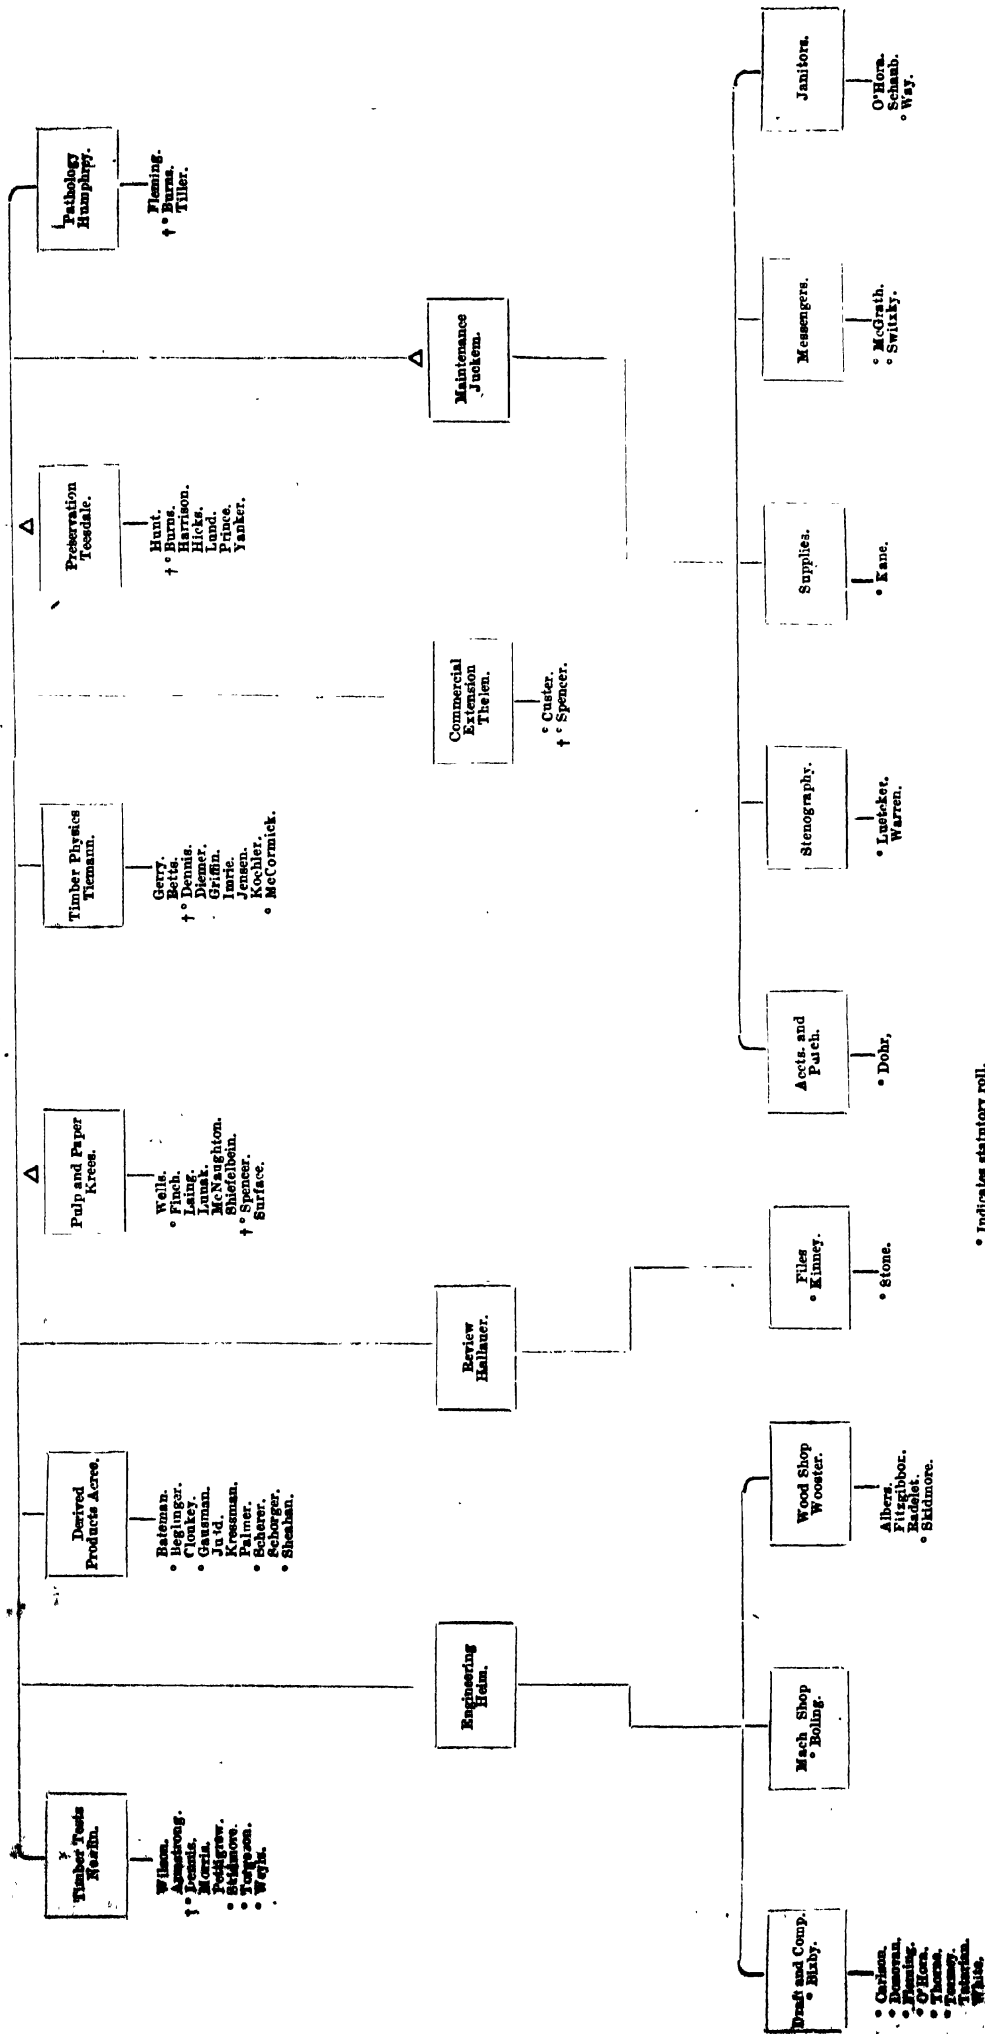

There are between eighty and ninety employees, and about forty of these represent the technical staff, that is, are people with technical or scientific training, chemists, chemical engineers, engineers, physicists, and foresters. The organization is shown diagrammatically on the enclosed blueprint.

Formerly, the results of our investigations were all published in Government bulletins, but this has gradually given way to publication in the trade and scientific journals. Only the more complete or exhaustive monographs are still issued by the department. I am sending you under separate cover a number of reprints showing the kind of material going to various journals, and a copy of departmental bulletin 343, "Groundwood Pulp," as representative of the departmental publications. I am also sending you a little pamphlet which outlines briefly the nature of our work with photographs of experimental apparatus, and finally copy of a report of our more important investigations and their relation to the industries.

If we can be of further assistance to you I shall be very glad to have you write us,

DIRECTOR'S OFFICE

Wells.
Winslow.
• Sinclair.

• Indicates statutory roll.

† Named under two sections.

△ Report to Director through Mc Winslow.

November 24th, 1915.

ORAL EVIDENCE, 29TH NOVEMBER 1910.

President.—Q. For how long have you been Forest Economist?—A. For eight years.

Q. What staff have you?—A. None, except myself. I have had an assistant off and on. He is now at the war. At present I have nothing but a Museum Assistant.

Q. It is possible for you to give us an idea as to the number of communications you get from the commercial community and other people asking for information? Could you express in any convenient way the quantity and variety of work that you have to do as Forest Economist?—A. I could not explain that to you easily, as my work is so split up. Firms make enquiries and also forest officers. These enquiries have gone up from 400 to 2,600 a year, in the last eight years.

Q. Do many of these matters require long investigation?—A. Some; others are absolutely trivial.

Q. Is this thoroughly a correct idea of your functions; that you receive from people of various kinds enquiries as to what forest products are available for use in certain industries, and you also tell commercial people what opportunities there are in regard to raw materials for developing industries?—A. That exactly represents one side of the work. The other side is the programme of work which is fixed every three years.

Q. For research work what staff have you got? Have you a Chemical Adviser?—A. We have a Chemical Adviser, who has an assistant not very highly trained.

Q. What other subjects, in addition to chemistry, would arise? What about the physical characteristics of your timbers?—A. The chief heads under which they come are testing of timbers, identification of timbers, identification of forest products and their uses, such as pulp in all its forms, *i.e.*, bamboo, grass and wood pulps, treatment of timbers, dry distillation, which includes charcoal, etc.

Q. Would you mind looking at your note. In answer to question 16, you say—“The Forest Research Institute has been instrumental in assisting the match, pencil, teabox, hobbin, rosin and turpentine, rosha and eucalyptus oil industries, in placing consumers in direct touch with the local forest officers and timber contractors, and in starting the business of treating timber, especially railway sleepers, and in carrying out investigations as to the value of bamboos and elephant grasses for paper pulp, in co-operation with pulp and paper manufactures in India.” Did not the Forest Department issue a special memorandum on materials for match-making?—A. Yes.

Q. Did they recommend the use of *Simal* wood?—A. They did, without a doubt.

Q. Are we correct in assuming that the complaint made against the Forest Department is justified that they recommended the use of unsuitable wood, and let the match manufacturing companies into an unnecessary amount of expense?—A. I agree; it was not, however, the investigator's fault. He was no doubt misled. I don't blame him in the least; I should have done the same myself.

Q. Should it not have been known to any forest officer that *Simal* wood disintegrates?—A. That is not the reason, the cause of the trouble is that the timber does not peel properly. It is wood which has a twisted fibre. In peeling you get 70 per cent. of good matches and 30 per cent. of bad.

Q. Is not the process of disintegration itself a drawback?—A. No one can claim that the matches are rotten on account of the wood disintegrating. It is a soft wood. It does not cut to a square split, and therefore cannot be dipped uniformly. The twisted fibre causes the match to break in two. Wood of just the same strength if straight grained would not break. It is the twisted fibre which is the cause of the trouble.

Q. What gave rise to the suggestion that *Simal* would be suitable?—A. It was tested by a reliable firm at Home and passed by them as eminently suitable.

Q. Were they a firm of match-makers?—A. No, they were a firm manufacturing match-making machinery.

Q. Did they give a favourable report on the wood?—A. Yes, and possibly it was a *bond fide* report. It was a German firm.

Q. So that you think that the forest officer was misled as well as the company?—A. It is possible the company were. I was not there at the time, but it is quite possible that an English firm would be misled by being sent only a small sample to test. The forest officer naturally picks a good piece to send Home, and thus mistakes arise, especially when it is sent to a firm who makes machinery. Anybody who sends timber to a firm who makes machinery will obviously get a good report on the substance, because the people want to sell their machinery.

Q. Would it be equally a mistake to get a report from a firm who made matches?—A. If they did not import matches into India a fair report might be expected. If they imported the article into India it would be a serious mistake to send them sample for report.

Q. You refer to having received reports from time to time from the Imperial Institute. These reports, I understand, were of a very variable character?—A. Very variable.

Q. Were they based on research work done by the authorities?—A. Yes.

Q. Do you get the names of the authorities who do the work, or do they merely send those official reports?—A. They are nearly always official reports. They tell us who carried out work in the laboratory, but they generally do not tell us, if they send a commercial sample to a firm, the name of that firm.

Q. It is important for you to know the names of the firms who have given these valuations, and opinions, as well as the names of the authorities who have done the work?—A. In certain cases, without a doubt, it is useful.

Q. You say that you are against laboratory research work being carried out by a Director of Industries, and that such work should be carried out by a body of experts under central control. Does that mean that you would not allow a Director of Industries to have a laboratory for making small tests of a physical and chemical kind?—A. I meant simply as a matter of principle that the work should be carried on in one place to save duplication of work.

Q. Supposing research work was required under a Director of Industries, because of peculiar local circumstances; would you allow the transfer for the time being, whether long or short, of a member of the Forest Department to conduct that research work in consultation with the Director, possibly in his laboratory or in the adjoining fields?—A. Yes, certainly. I am not very much in favour of allowing experts to go and do work, say, for a company, because it brings in so many difficulties, but with a Government official, like a Director of Industries, I don't think there would be any objection.

Q. You say that the Director of Industries need not be a business man necessarily, in the sense, I suppose, of a man with commercial experience, but he should have a fair stock of business qualities, tact and commonsense. Afterwards you propose to augment the Forest Department by the appointment of a staff of business men. Do you mean men of commercial experience, in order to dispose of your forest products?—A. Possibly it might be convenient to have a forest officer.

Q. Would it not meet your point if the Forest Department were enlarged sufficiently to provide enough officers, not only for conservation work and engineering work, but to deal with the commercial side? Is it necessary, in your opinion, that those officers who have to deal with commercial firms should have commercial experience in advance? Don't you think that your forest officers have sufficient business qualities?—A. No, I don't think for a moment they have. I have been a divisional officer myself for a number of years and know for certainty that they have not got sufficient commercial knowledge.

Q. Can you expect that they will show a knowledge of business methods if the whole of their service is devoted to work on the forests. Forest officers are overloaded with the work of conservation and the usual official routine. Would you expect any of them to show a knowledge of business methods?—A. Surely, some would by training develop into quite good business men.

Q. If you had a larger number of forest officers, not so loaded with official routine duties, would they not show some of these qualities?—A. Certainly, but why put an engineer to do traffic superintendent's work when you have a trained man to do such work, and *vice-versa*?

Q. In your opinion should a knowledge of the forest be greater than a knowledge of business methods, or should a knowledge of business methods supersede a knowledge of forest resources?—A. You cannot often get a forester to come forward and do commercial work. That might be all right in theory, but not in practice.

Q. If you appoint to the Department an officer who is not a forest officer but a business man, is it not likely that he will soon neglect the point of view of a forest officer and that there will be friction between him and his subordinates. If, on the other hand, the officer who is doing the commercial and business side is a forest officer of some experience, he will be able to look at the problem from the point of view of the conservator first and the business man second. Which should be the predominant feature of such an official?—A. We have got men working who are not forest officers, *i.e.*, the manager of Bhawali, the man in charge of the antiseptic treating plant. So far there has been no trouble whatsoever; besides the forest officer can be relied upon to look after forest interests.

Q. Must not the balance of interest between exploitation and conservation give rise to difference of opinion?—A. That is true, but I don't think it necessary to appoint forest officers, though if you found three or four men in the Forest Department suitable for the commercial side, they should not be debarred from appointment to such work. This might bridge over the difficulty to a certain extent.

Q. What kind of men would you recruit for this forest commercial section; would they be recruited on the present lines for the Forest Department?—A. Not at all, I should pick up likely men who had some Indian experience.

Q. What prospects would you offer them in the way of pay, service, promotion, etc.?—A. I should offer them exactly what the forest officer gets already, otherwise you would have a breach in the two branches of the service.

Q. You would have them as a parallel line?—A. Yes.

Q. And a staff of something like 20 or 30 men?—A. Yes, and increase it if it worked well. As I tour through the various provinces, I find that I have to do the work of the commercial man in each province for a fortnight or three weeks. If we had local men who had more experience of each province than I have, they would at once be able to tell the forest officer the price of timber, and the requirements of the market. At present the men are absolutely case bound in their districts and cannot get out. I know of a case in which two officers in adjoining districts who were bidding against each other while trying to sell *Sal* sleepers, one offering sleepers for R2-4 and the other for R2-8. They could have got R2-12 if they had had a commercial man working for them.

Q. All that is in favour of developing the commercial side of the Forest Department, but the point I am now narrowing the issue to is with reference to the kind of man you would recruit, would the prospects you offer him prove attractive? You would have a commercial man in each circle; what would happen to the senior man? Would these men always remain as sectional commercial men, one attached to each circle?—A. You would have to have them on a common list.

Q. Will they all do the same work?—A. Yes; it would make no difference if we had two or twenty divisional officers.

Q. Would it not be an advantage if your young forest officer, say, of ten years' standing—supposing you had a staff sufficient for the purpose—could be spared to do this commercial work, one in each circle. After getting this commercial experience, he would be available for promotion and ultimately become a conservator. Don't you think he would be a better conservator for having commercial experience also?—A. That means you chop and change with you commercial men. Until a man has got three or four years' service as a commercial man, he would be practically useless. He would not be in personal touch with the companies dealing in timber.

Q. The real point I want to be quite certain about is whether the men required for a commercial side of the Forest Department can be better obtained by direct recruitment or by enlargement of the present forest service and selection of extra men of five or ten years' service to be attached to each circle for the purpose of assisting in the disposal of forest products. If you employ an outside commercial man for advisory purposes, I cannot see what you are going to do with that commercial man if he wants promotion. If he was not under the forest service, don't you think that there is a chance of his position being abused?—A. Yes, possibly.

Q. Don't you think that chance would be greatly reduced if he was a recognised member of the forest service?—A. It is possible that it might lead to abuse, but I don't see why it should, more than with men belonging to the service and under the conservator. The commercial men would consider themselves forest servants just as much as the forest officers and would be under the orders of the Chief Conservator. As regards promotion it is a question of Government offering sufficiently good pay and prospects.

Q. Is this proposal your own or are you speaking with more or less certain knowledge of the ideas that are current in the Forest Department?—A. It is my own. I know there are a lot of officers who are against the proposal; they say it is putting the cart before the horse. I look on it as a link in the chain between the forest officer and the commercial world.

Q. Have you thought of this point of view, that the commercial side of forest trade might be sufficiently dealt with if you increased your forest staff, so as to be able to spare a man after five or ten years' service, in order to devote himself almost wholly to the commercial aspect of forestry?—A. It has come up repeatedly when considering local Forest Economists.

Q. Is it not a difficulty under the present system that, when a man becomes a Forest Economist, he is in danger of sacrificing his promotion to the higher grades of the department if he specialises too long?—A. Surely, I have thought of that myself.

Q. You think that an excellent Forest Economist might mean a good Inspector-General wasted?—A. That may be, but on the other hand the Forest Economist might be going back to forest routine work.

Q. Do you know the size of the staff they have in the corresponding section of forest economy in the United States?—A. They have from 80 to 90 men.

Q. You have the diagram showing the organisation of the staff. Do these 80 include the technical staff?—A. In his letter to me the Director said there were 40 or 44 experts, the rest being Museum Assistants, etc.

Q. They have 40 men of the kind that you would call efficient officers?—A. Yes.

Mr. C. E. Low.—Q. What was your own training?—A. I was for two years an engineer at Cooper's Hill working for a Public Works Department appointment. I was offered the forest and went over to the forest side, because my father was a forester before me.

Q. Have you had any discussions with firms who have been wanting to take up forest products in order to develop industries?—A. Yes, on the question of pulp and treatment of sleepers.

Q. Did you find that they had been finding much difficulty in putting up money?—
A. No, the money question never came up; in fact they were quite happy about the question of raising the capital.

Q. Did that happy state of mind depend on receiving definitely reassuring reports from Government experts?—A. Partly that and partly by their carrying out their own tests. We suggested to them that they should carry out further tests and assure themselves that it was all right.

Q. Would you care to see a large firm coming in and taking up industries like pulp on the unsupported attestation of Government experts?—A. No, I should be very sorry if they did do so.

Q. You would feel distinctly nervous if the public put capital into things on that basis?—
A. It would rather depend upon the expert. I told them that I was not a pulp expert. I could give figures about cost of extraction but would be sorry to back what was done on a laboratory scale in the case of pulp. We indicated to them and they accepted the fact that further tests were required.

Q. They had these tests carried out in England?—A. They carried them out themselves here. There were tests carried out in England, but what they pinned their faith on was their own tests.

Q. You think that in the case of organised industries worked on somewhat technical lines, they must rely to a large extent on their own investigations?—A. As matters now stand, yes.

Q. Do you think it would be possible for Government to equip themselves in such a way as to render it unnecessary for firms to make their own investigations?—A. Practically so, if you get a large enough grant and employ experts, but, in the cases referred to above, we have had no experts, such as for instance in connection with the antiseptic treatment of timbers. I have dabbled in this subject but could not put myself up as an expert. It is impossible to be an expert in a dozen subjects. I can find out roughly what can be done and tell them so. I think if Government appointed real experts and we were to get suitable plant, we could put up a strong case, which would be quite reliable.

Q. How long have these rosin and turpentine pioneer factories been working?—
A. About 20 years. The Bhowali factory has within the last 5 or 8 years been considerably improved.

Q. Have the Government invited any one to take over any such factory?—A. No, on account of the Punjab and United Provinces competition. I believe the tan extract factory in Burma was put up for sale to anybody who would take it over.

Q. To what do you allude by the Punjab and United Provinces competition?—A. The crude resin is very expensive to collect in the Punjab. Anyone taking up the business in the United Provinces could kill the Punjab concern in a very short time.

Q. You say that forests would be instrumental in assisting certain industries. Apart from the match-making industry, which industries have been run on a successful commercial scale, with materials provided from Government forests?—A. Tea-boxes and bobbins. There is a factory near Calcutta running bobbins. Over a million tea-boxes are made a year from local wood, i.e., from *Tulla* and *Simal*. This quantity is not sufficient, however, to supply the demands of the entire trade.

Q. In the case of testing timber to ascertain its suitability for making matches and match-boxes, has any use been made of existing machinery in India to test such timber?—
A. Yes, many tests have been made. We tested a lot of timbers at Bareilly. We get satisfactory tests carried out under existing conditions. Bareilly is very good at this work.

Q. Supposing we had what would be a properly organised and scientific department, would the submission of samples to the Imperial Institute tend to become more or less frequent?—A. I should say it would entirely stop.

Q. You say you found them unsatisfactory in respect of establishing a commercial connection?—A. That is what we found.

Q. What is the reason of this special weakness of theirs in that respect?—A. They don't seem to care to disclose the name of the firm. What reason they have for this I cannot tell you.

Q. Perhaps they don't know it?—A. Oh, yes; they do.

Q. Have you had any experience of working through the Commercial Intelligence Branch of the Board of Trade?—A. None at all.

Q. Do you think that if you had a call on the services of the Commercial Intelligence Branch by the appointment of an Indian Trade Commissioner in London, you could get any help?—A. I think we might. The number of our reference home is very small because the timber that is exported is well known and finds a ready market. India absorbs practically all that we can put out of other timbers.

Q. Do you think the importation of Jarrah from Australia is economically sound from the forests point of view?—A. I don't think it matters how much is imported; we can always sell at good rates anything we put on the market.

Q. We are not wasting what we might otherwise sell?—A. In the way of, possibly, sleepers, but the demand is so great for many of these timbers that there is room for anything we can put on the market, and we can undercut Australian timber if we can get our timber out of the jungle.

Q. Would you consider it an argument against entrusting a Director of Industries with control of research that the Director of Industries might be impatient of the slow results of that work?—A. Certainly, that would be the case.

Q. You say you are against an Imperial Industrial Department. By an "Imperial" Department do you mean a department under the Government of India or a department of the Government of India?—A. A department under the Government of India.

Q. Whichever was the department of the Government of India concerned, whom should they look to for advice on questions regarding promotion of industries, in the same way as the Revenue and Agricultural Department of the Government of India look to the Inspector-General of Forests for advice?—A. For commercial or research work.

Q. For its industrial policy?—A. They will have to look to the Director of Industries very largely for their information on such subjects. The more they go to the local official the more reliable information they will get.

Q. Supposing it was a question like this; two provinces were entirely at variance both on facts and policy; whom would the Government of India ask for advice?—A. I should ask both of them; if you have another man between, it simply makes him a post office. Somebody has to make up his mind on the point at issue.

President.—Q. Is that what you call your Inspector-General?—A. Yes, though no doubt he deals very largely with working plans, he often passes on the opinions of others.

Mr. C. E. Low.—Q. He very often advises on the business aspect of reports from the Imperial Forest Institute?—A. Yes, he very probably has further knowledge enabling him to do so.

Q. You are aware, no doubt, that the development of industries under different local Governments has hitherto been very unequal in the extent to which it has gone?—A. It hardly comes within my province; I know nothing about it.

Q. I see you propose as a member of your expert staff a business man; do you consider that necessary if you have a commercial branch of your department?—A. I meant by a business man a man who will answer the small conundrums that come into the office. We have a great number of non-technical enquiries, and you require somebody to answer them. My time is now taken up in answering routine enquiries. What is wanted is a sort of general intelligence officer.

Q. With reference to what the President was asking you about forest commercial men, how would it do if you had your man with an ordinary technical forest training at home and you apprenticed him to some suitable commercial firm?—A. That would do very well. As long as he gets a training which our men do not at present get in commercial matters.

Q. You speak about the extraction of timber from the Himalayas as a problem in forest transport. Do you think the problem is capable of solution on a commercial basis?—A. I should say so; it is so in British Columbia.

Q. Is any practical commercial solution applicable to Himalayan forests generally?—A. Yes, I should say so. I think the timber could be got out. I might say that a forest expert from British Columbia saw the Himalaya and he expressed the opinion that similar difficulties had been overcome in British Columbia. That is what I base my opinion on.

Hon'ble Sir F. H. Stewart.—Q. In connection with these many problems, there is a great deal of correspondence, I suppose. Does it mostly go through you or through other officers?—A. Nearly all comes to me personally. I very often know the people, and they write to me personally.

Q. Then there would be no question of increasing the staff of other departments in similar proportion to what you recommend for the Economists?—A. No.

Q. You refer to the question of Simal wood for matches as being advised by a German match-making machinery firm. Was the reference to them made at your instance or by the firm who were ready to take up the industry?—A. I was not in charge and would not like to say how it came about that that wood was sent home. It was before I was at Dehra Dun.

Q. I think you have explained that the Forest Research Institute take no responsibility, but give the best information you have and advise people to pursue the matter further?—Yes, if the case is a doubtful one.

Q. With reference to your suggestion for a forest economic section do you think that would be necessary in all the provinces if you have your Central Economic Department properly organised?—A. I am certain of it. Take for instance the question of surveys which

enable one to increase our existing knowledge of outturn of any one product. This must be done by special local officers. The men in the Imperial Forest Research Institute can never expect such help from the local provincial officers who are too busy. I would have these special officers placed in such a position that they could go round to commercial men and say "we have got so much raw material for pulp, etc."—and so take that part of the work off the Research officer and thus give him time to do research work at the Forest Research Institute.

Q. Even then if you had an improved Economical Department, a Research Institute and also a Director of Industries, you don't think that would help?—A. The latter cannot on the face of it tell you or be expected to find out what is in the forest, so far away removed from his real sphere of action. He can help on the business side.

Q. Are there local Forest Economists at present?—A. No, except one in Burma who is called a Forest Research Officer, and who investigates both sylvicultural and economic problems.

Q. About the recruitment of these staffs, do you think you could get them at the pay you are able to offer them?—A. I think you could. I could pick half a dozen men in India now, who would be eminently suitable, and who would be willing to accept such appointments.

Q. Simply because of their interest in that sort of life?—A. Possibly, and also on account of the shikar, etc. We had no difficulty in getting a manager at Bhawali. We went to Manipuri for him. He is an engineer and a common-sense man, who, I understand, answers very well.

Q. Even if you got your commercial man, do you think you could get your engineers, or would they have to be regular members of the forest service?—A. We would have to make them regular members of the Forest Department or we should have trouble. As regards engineers, Public Works Department men would be suitable only in some cases, while in others, such as, for the extraction of teak from the felling areas to the edge of a floating stream, I don't think a Public Works Department man would do. A man from Canada would be eminently suitable, and would probably answer far better than a local man for such purposes. It is a very special subject.

Q. Who deals with these sort of engineering problems now?—A. The Forest Officers try to, and sometimes succeed but they have not the time, and have therefore to go sketchily about the business.

Q. They have not had the necessary education?—A. No, I don't think so; 99 men in our department out of 100 will tell you the same thing.

Q. Is it true that imported timber obtains preference even in districts quite near the sources of indigenous timber?—A. That is a big question. If you put teak down, there is nothing in the world that would compete against it. Take Oregon pine, for instance; even that timber cannot compete with teak. You will find throughout Calcutta trade names for timbers which boom for a couple of years and then die out.

Q. You don't think it is on account of better organisation, or even made on account of the difficulties of transport which the indigenous forest product has to encounter?—A. Transport accounts for a great deal, as in the case of imported deal from Sweden which is cheaper than Himalayan conifer timbers; the latter being expensive to extract.

Q. Principally extraction?—A. Very largely, and also conversion when you have got it out. For instance, you have a Forest Officer in charge of saw-mill; he begins by not buying the right kind of plant, and when it comes to cutting he not infrequently saws his timber into unsuitable dimensions simply from want of experience. That is why I advocate the commercial man.

Q. These imported timbers come in the right sizes duly sized and marked?—A. Yes, otherwise no one would buy them.

Hon'ble Sir Fazulhoy Currimbhoy.—Q. You say you are "in favour of either the part share capital system or Government pioneering in cases where the undertaking involves large initial capital." What do you mean by "large initial capital"—very big capital?—A. Yes, say twenty lakhs of rupees.

Q. Don't you think that if Government start a particular industry with very large capital, they would not be able to help firms with small capital?—A. My remarks were with reference to industries connected with forest products.

Q. Don't you think that if the Government gave some concessions to private firms, they would be able to start these industries?—A. They have not been able to do so up-to-date.

Q. Through what medium do you give your information to the public?—A. There are published Government reports, memoirs and pamphlets, of which a large number are distributed free.

Q. Then you want Government Directors to be appointed in cases where the Government gives direct financial assistance. Do you want these Directors to be experts?—A. When I wrote that, I was thinking of a joint bamboo pulp industry in Burma, which has not been started and which is acknowledged by many firms to be a good business. We have got to

get over this difficulty in some way, and it is proposed to do so by means of a joint share system in which Government must have some man to supervise their own interests. I don't think Government would care to hand the whole business over to the firm and trust them entirely.

Q. My question was as to whether you want the Government Director to look after the financial side, or be an expert?—A. No, the financial side only.

Q. Then about the Advisory Board. You are not in favour of it. I suppose your experience of such a Board is confined to the United Provinces?—A. To a certain extent. Why I don't like such a proposition is that the more official interference there is, the less likelihood of the thing going through.

Q. Suppose you have a Board upon which there are reliable members, and where you could get business men who would be of great assistance to the Director of Industries. Don't you think they would be very useful? We have got such a Board at present in Bombay?—A. I don't quite know enough about it to answer that question.

Q. You say "All Technological Research Institutes should be fitted into a general development scheme for the whole of India, controlled by an Imperial governing body." You want a new body to be created?—A. I am speaking entirely of research work. You will have to have a Board where there are many fields of research, to settle the programme of work.

Q. About a business man, do you think you want a business man out of the service, or a service man to be trained up just as Mr. Low suggests?—A. I would sooner have a man from outside the service put into it.

Q. Do you think he will come into the service unless he is paid very highly, because the forest service has its own grades and they have promotion. This man will not have advantage of this?—A. It can be done if he is put into the Forest Service, with equal position to a Forest officer.

Hon'ble Sir R. N. Mookerjee.—Q. Am I right in understanding that you are opposed to lending an expert to any firm?—A. Yes, unless there was very special business to lend him for. If you do so, it has to be settled later as to how much of that acquired information belongs to the firm and how much to Government. It is a very unsatisfactory way of getting out of the difficulty.

Q. In a place like India, if a firm finds difficulty about technical advice, how are they to get it?—A. They can write to the Research Institute and get the advice. It is inadvisable that they should get the loan of an expert, as his services should be exclusively used for general and not individual use.

Q. Even if the firm is willing to pay for his services?—A. Yes.

Q. In answer to Mr. Low you said, if necessary, you can undercut prices to prevent the import of certain wood into India. Am I to understand that you can charge any price you like to customers in India?—A. Forest produce is practically all sold by public auction.

Q. If I go to you to ask for certain woods, which might be used in place of teak, it appears from what you say that you have no system of charging but can charge any price you like?—A. We put up the wood to auction and it is sold according to the prices obtained.

Q. Then how can you undercut, when the royalty is fixed by Government?—A. Anybody can buy at the fixed royalty.

Q. Do you think it is conducive to the advancement of any business in connection with forestry in India that you are allowed to charge as you like?—A. We are selling a given produce and we can sell it for whatever we get for it. The local Governments have power to charge royalty on timber when not sold by public auction.

Q. But you said you can undercut; do you go to Government to allow you to reduce prices?—A. No, we don't, but we can do so.

Q. That is in your power?—A. Not in the power of the forest officers but of Government. Forest produce must be sold by public auction or at fixed royalty rates or sold by sealed tenders, but as a matter of fact you could undercut. I don't say that it is done, but you could do so. There is no definite rule as to what you should sell by public auction, or what at royalty rates.

Dr. E. Hopkinson.—Q. Do you consider that a general survey of certain Indian rivers ought to be made?—A. A survey was talked about in the case of a river in a division I was in and it would certainly be of great advantage. It was a river on the west coast.

Q. Assuming such a survey necessary, by whom would you propose it should be carried out?—A. If it was a survey for forest purposes, the forest officer should do it. We have done occasionally very sketchy surveys. A great deal of river survey work is done in Burma, but that is done by the teak firms. I know of one place where we could reduce extraction by one-half if we had a proper survey.

Q. I suppose it would be necessary for a general survey to have a special expert from Canada or the United States to be attached to the engineering side?—A. Surely that applies not only to streams but to rope-ways as well and other branches of forest engineering.

Q. Do you think that such particular work could be equally well carried out by a corps of engineers attached to some Imperial Department and not directly attached to the Forest Department?—A. I do not see why it should not.

Q. You don't consider it important that they should form an integral part of the Forest Department?—A. A *esprit de corps* would be engendered better were they classed with forest officers.

Q. In section X you give a list of certain industries, the enquiries about which are either completed or are in progress. When completed are the results published?—A. Yes, in the forest reports. A "memoir" is a very finished report and rarely issued. A "Forest Record" is a sort of interim report in which results are published about an enquiry which requires further investigation.

Q. Are reports published yearly?—A. No, there is considerable delay in issuing reports. I wrote my note on bamboo pulp in 1910 and it came out in 1912.

Q. When it is finally published, whose duty is it to see that it is circulated in suitable quarters?—A. There is a free distribution list, and attention is drawn to it in the papers by means of short notices reviewing it. I think it becomes fairly well known, if of any interest.

Q. All that is done within the department?—A. The Superintendent of Printing distributes it. He is given a list prepared by the Inspector General, and any additions which we often make or suggest are added.

Q. There is no sort of transference at that point to the Department of Commerce and Industry?—A. I am not sure on that point. I think they are distributed, and are advertised to a certain extent by that Department. They seem to find their way to the interested parties.

Q. And when the Forest Department has completed its enquiries and published the results, they have finished their duty?—A. They result in a crop of enquiries.

Q. I was going to say, except to answer enquiries?—A. Yes. If it is a "Record" the enquiry may be still going on. When we have come to a point where we think we ought to publish further information on the subject, we do so. We may be five years working on a subject. Then we go on to substantiate our facts until the final report in the form of a "memoir" is published. The pulp enquiry is still in progress, and we have already published three reports in "Record" form.

Q. The point I want to get at is, whether it is the business of the department, or the practice of the department to get the thing going after it has been proved?—A. Yes. I go and call round on the firms in various places, trying to get them to take up the business. Even before the enquiry is written I often go round and try to get people to start, at the same time explaining the position of affairs to them.

Q. That is done at the cost of a considerable portion of your time?—A. Surely.

Q. It might be done equally well by a less qualified person?—Surely, it does not want an expert to do so.

President.—Q. How long do you say it takes for your report to come out?—A. Certainly more than a year.

Q. Whose fault is that?—A. I don't think it is anybody's fault. Say the Inspector General is in Burma and I am in Madras. The report goes to be passed by the President, Forest Research Institute, and the Inspector General then backwards and forwards to the press. So many people have to see it before it goes through that one can write another report by the time it comes out, a much better one probably, because you have got much more information by the time the original report is issued by the Press.

(Witness subsequently forwarded the following note on the delay which occurs in the issue of forest publications.)

At the outset it seems necessary to explain the procedure followed which is as noted below :—

The author sends the manuscript together with the illustrations for reproduction to the President.

The President edits the manuscript, making necessary corrections when required, and then transmits it to Inspector General of Forests with his recommendations.

Inspector General of Forests returns it to the President with his orders.

It is then sent to Calcutta Press.

The first proof when received from the Press is checked in President's office (Publication Branch) and then sent to author for correction.

On its return from author it is again sent to Press for a clean proof, and the above process is repeated.

Sometimes it becomes necessary to call for a 3rd proof before the publication is passed for final printing.

Up to last year, the final proof used to be sent to Inspector General of Forests for his approval, but to obviate delay President has been authorized to pass the final print order.

The illustrations are generally done at the Boorkee Engineering College. In two instances, however, they were done in England, but owing to war, they were delayed, otherwise the final printing of a publication is seldom, if ever, delayed on account of non-receipt of illustrations in time.

In regard to publications issued during the two years 1915 and 1916, the following statement shows the average time taken in the passing of a publication through the various stages :—

Average Time.

	Institute.		Inspector General of Forests.		Press.	
	M.	Days.	M.	Days.	M.	Days.
(1) With the President in editing the manuscript	0	9				
(2) Inspector General of Forests			0	20		
(3) In President's Office (Publication Branch) (The Manuscript is sometimes returned to the author to note Inspector General of Forests' remarks and revise it in the light of those remarks).	0	11				
(4) Preparing a galley proof					1	14
(5) Checking the same in Publication Office and by the author.	1	22				
(6) Preparing second proof					1	12
(7) Checking the above in Publication Office	0	6				
(8) Preparing final proof					0	28
(9) Checking the above in Publication Office and by the author.	0	22				
(10) With Inspector General of Forests for final approval			0	9		
(11) Final proof returned to Press	0	4				
(12) Final printing and distribution					2	18
The average total period in the issue of a publication thus comes to :—						
In Research Institute	3	14				
In Inspector-General of Forests' Office			0	29		
In Press					6	7
TOTAL				10 months and 20 days		

The delay in the Institute is due chiefly to Research Officers being on leave or on tour.

The time taken by the Press, especially in the final printing, may perhaps be considerably shortened.

It has been noticed that the Calcutta Press sometimes take two months in sending proofs of publications containing 6 to 10 pages only.

Mr. A. Chattarton.—Q. In answer to question 62 you say that you are in favour of the appointment of Directors of Industries in each province, and in the same paragraph you say that so far as he is concerned, the Forest Department would make no use of his services. You would rather have the forest commercial staff?—A. They would do entirely different work from what the Director of Industries would ever do. The commercial staff would actually have to sell timber, ascertain the market rates, what demand there was, etc., which would have nothing to do with the Director of Industries.

Q. That depends on what you make the functions of the Director of Industries; you have not defined what those functions are to be?—A. I did not intend that he was to be an executive officer, actually starting industries himself. He would do very much what the Director of Industries in the United Provinces does now.

Q. The general idea underlying the creation of such posts as Director of Industries is to afford advice and assistance to commercial people in dealing with the development of industries in the various provinces they are attached to, and if the Forest Department is excluded from the operations of the Director of Industries, it means to some extent the creation of a separate staff doing actually similar work?—A. I did not assume it being separate in any way. I said it was very advantageous that they should work in with the Director of Industries.

Q. If we assume that the Director of Industries will have fairly wide functions, and a certain amount of executive power, would it not be more convenient to the province if these commercial officers were attached to his staff and work in co-ordination with the Forest Department?—A. I am certain that if the Chief Conservators and the forest officers had to go to the Director of Industries to sell their timber, there would be continuous friction, and a very great hindrance to practical working.

Q. For instance, take section X, in which you give a large number of examples of industries which are being worked out; and take no. (XIX) in the same section: you say that "the introduction of improved methods of manufacturing charcoal and combining this industry with the preparation of Stockholm tar in pine areas and of wood-tar where broad leaf trees are utilized." Is it not a fact that the demand for charcoal would largely depend upon the operations of the Director of Industries?—A. Not in the least. Nine-tenths of the whole of the charcoal is made in the forest.

Q. Who is it made for?—A. A great deal is for local consumption round the forests; in some cases it goes down to Bombay or other cities, but the greater portion is absorbed round the forest.

Q. Would it not be of great advantage to the Forest Department in improving their reserved areas, if there was a much larger market for charcoal?—A. That is a big question, and it is impossible to answer it. The uses of charcoal vary from place to place. I could give you a dozen examples of different things for which charcoal is utilized. It would be advantageous to increase the output of charcoal in some forests, while it would be disastrous in others. We do not always look on the preparation of charcoal with happiness. For instance there is very little demand for charcoal from twisted *Chir*; though by manufacturing Stockholm tar in conjunction with *Chir* charcoal, an industry might be started.

Q. In nearly all cases where you publish memoirs or reports, on industries, would it not be the business of the Director of Industries to deal with them?—A. Yes, sometimes.

Q. If he had part of the staff intimately connected with commercial working in the Forest Department, he would be more likely to be in a position to make use of these researches?—A. If you look through the list of publications, I do not think you will find two that have directly to do with the Director of Industries.

Q. I don't suggest that the Director of Industries or his department should do this work, but when you have done the work and want to get at the commercial application of it, instead of doing it through your own commercial staff, would it not be better if you referred it to the Director of Industries?—A. The Director of Industries could help us. He does so in the United Provinces, but the number of such cases compared to the whole is small.

Q. There are certain difficulties in certain commercial offices. We might get over those difficulties by attaching a commercial staff to the Director of Industries?—A. Then you create that gap I referred to before between the commercial staff and Forest Officer in practical working, and until you have your department behind you, the system suggested would be a failure.

Q. I have some experience of this, and find it works very satisfactorily. The Forest officer extracts the materials and in certain cases hands them over to other departments to deal with?—A. There you have a case where you have the Forest Department very much in control. The Chief Conservator of Burma is rather an independent man, with a very big department behind him. If you told him "You are not to sell any timber, we are going to let the Director of Industries handle the whole thing", I don't think it would work for very long. It might do in small places, but where the Forest department is of importance, I think there would be trouble. It would not be conducive to good work.

Q. In regard to these investigations how many experts have you got in the Forest Department?—A. We have got none; we have only got a pulp expert who gives us advice; a tan expert who is out temporarily, and a chemist who is an expert on certain subjects.

Q. How are these men entertained in the department?—A. The paper-pulp expert was originally employed by the United Provinces in their exhibition. He came on to us for two or three years on a fee, temporarily, and when he left he knew a great deal about the subject, especially about elephant grasses and bamboos. We thought it advisable to keep some sort of lien on him so that we might get further advice. When I went on leave he was still given a retaining fee and submits his reports and whenever we want anything tested, I send it to him.

Q. Is he attached to your office and subordinate to you?—A. No.

Q. To whom is he attached?—A. He is attached to the Forest Research Institute.

Q. With your experience of these matters, would you advise development of that system in obtaining temporary experts?—A. No, it is absolutely wrong. It answered its purpose up to now, but it is not the right way of doing it. You must have permanent experts and make it worth their while to stay.

Q. Supposing you have a permanent man; how is he going to get his training as an expert?—A. In the same way as any other expert. He has got to go through a certain amount of training at home, and if he has got practical experience all the better. The tan expert was with a tan extract manufacturer, and then he specialised on new products in the East, and certainly if there is an expert, he is one of them. He has had long experience in Borneo, at home, and in Cyprus.

Q. Can you recruit him in the ordinary course of recruitment of the Forest Department?—A. No, you cannot pick such men up easily. It has taken two years to find the right man, and the number is relatively limited. It is not the same thing as recruiting a big department. It is very difficult to make any rule about experts of that sort; they are nevertheless necessary.

Hon'ble Pandit M. M. Malaviya.—Q. You say, in the first paragraph of your note, that an arrangement of part share capital should only be undertaken in the event of no reliable company coming forward to undertake the business entirely on their own responsibility. When you have made your investigations into a particular industry, how do you publish the result?—A. They are published as a "Memoir" or "Record"; a forest publication.

Q. You do not put it in the Government Gazette?—A. I don't think it has been done up to now.

Q. Would you recommend that the Government should publish it to all Chambers of Commerce and public bodies?—A. Copies are sent to all Chambers of Commerce and public bodies; they are for free distribution.

Q. Do I understand you to say that it is only after giving these bodies time to consider whether they will take up the project that Government should pioneer it?—A. Yes, if they find that they cannot get anybody to take it up. In many of these instances I go round to likely people and suggest it to them. As a matter of fact throughout our forest experiences, we have to pioneer everything.

Q. You say, "of recent years the policy of Government has been to grant leases on favourable terms to companies for the extraction of raw forest produce, in connection with new industries, etc." Can you mention instances of some of these leases; for what purpose have these leases been granted?—A. For extraction of bamboos for paper pulp; for extraction of spruce for wood-pulp, etc.

Q. Have none of these leases been utilized?—A. Some of them; those connected with tea-boxes, spruce and bamboos have not as yet been worked.

Q. Was there a time limit in these leases?—A. The special conditions in connection with the war upset them. One cannot say definitely whether they would have been taken up or not, but possibly they might have been.

Q. You mention under the heading 'X—General,' certain industries in connection with which enquiries have been completed, and you mention the manufacture of paper among them. Is that one of the enquiries which have been completed so far as you are concerned?—A. No, we are at it still, but with bamboos we have done a good deal. Much still remains to be done as I told Mr. Chatterton. If we employed a man on pulp for 20 years, there would still be work for him to do. There are 107 species of bamboo in India, and we have tested four or five species, and one of those we have absolutely finished. We have demonstrated that one or two species of bamboo are suitable for pulp.

Q. Have you ever considered the question of utilising the husk of rice for the manufacture of paper?—A. It has been tried, but not by the Forest Department. Sugarcane has also been tried.

Q. Do you know with what result?—A. I could not say offhand. I think the results were fair though it is a complicated question. You can make paper out of anything if you care to spend the money, but it is not always a commercial proposition. So many factors have to be taken into consideration that it is very hard to say that one raw material is better than another.

Q. Are you aware that in Japan they make paper out of rice husk?—A. I was not aware of the fact. Do you mean white paper? I know they make brown.

Q. You say, "I am strongly in favour of Imperial scientific and technical departments for chemistry, botany, geology and zoology, etc." Would you place them all in one centre or will you have them in different centres?—A. It is rather beyond my scope. I have not given it very much consideration. I don't know much about it.

Q. In your opinion could any of these departments be suitably added to the Research Institute at Dehra Dun?—A. Botany might.

Q. You compare expenses in the Forest Department here with those incurred in the United States of America. Is the area under forest in the United States very much larger or is it about the same as here?—A. I don't know; the area under conservation may be bigger but they have enormous tracts where practically no minor forest products exist. It would be impossible to draw a comparison. What they might put down on paper as an area under forest would be very sketchy. I could not answer the question, but as far as management goes, we are far ahead of them. We start with reserving our forests and doing research work afterwards, whereas they did the opposite. They have developed their research work very largely, but are still very deficient in some of their protective measures.

Q. Have you compared their forest rules with yours?—A. No, I could not tell you anything on that subject, I have not studied the subject.

WITNESS No. 81.

raham.

Rev. J. A. GRAHAM, D.D., C.I.E., *Missionary of the Church of Scotland, and Honorary Superintendent, St. Andrew's Colonial Homes, Kalimpong, Bengal.*

WRITTEN EVIDENCE.

Notes on the home or cottage industries and on the working of the Kalimpong Mission Industrial School.

Kalimpong is the headquarters of the sub-division of that name in the Darjeeling District. The sub-division is a Government estate. There are no large land-owners and the policy is to maintain a *bona fide* crofter population of hill people holding the land direct from Government. The crofters are Nepalese, Lepchas and Bhutias—the Nepalese predominating. The population of the sub-division was 42,586 at last census. Kalimpong is on the high-way to Tibet and the centre of the Tibetan wool trade.

In 1905 the local Church of Scotland Mission began an industrial school with a view to the development of home industries among the crofters. The Mission had been established at Kalimpong since 1880 and had gradually established primary schools throughout the sub-division. The rapid growth of the population during late years and the dividing up of the land gave the economic suggestion for the industrial school while the difficulty of reaching the girls and women through the ordinary schools suggested for the women a combination of industries with the educational methods. The Kalimpong Mission Industrial School.

The industries represented—

Lace was the first department organised. The services of a thoroughly qualified teacher who had taught lace work in England was secured and from the first a *high standard* was adopted. This has been maintained and it is claimed that the lace made is equal to that of Europe.

Embroidery was soon added. At the beginning teachers were imported from Hooghly District of Bengal and from Lucknow. Subsidiary branches such as crochet and knitting, were also developed.

A weaving department followed. The Serampore loom, Salvation Army loom Weaving. and Hattersley's hand looms have been introduced. Improved methods of reeling and warping have been adopted for *cotton weaving*. At the start women only were employed in the weaving but it has now been found advisable to train boy apprentices also.

The fact that Kalimpong is the trade centre for the wool trade from Tibet and the existence of a Tibetan industry naturally suggested the making of Tibetan rugs and carpets. The workers (women) employed in this department are Tibetans and Bhutias. It is intended (with the advent of an expert lady from Britain) to take up the manufacture of Tibetan tweeds after the style of the Harris tweeds made by the Scottish crofters. (These have already been made successfully in independent Sikkim).

Dyeing is a necessary accessory of the weaving school and with the exception of indigo and logwood all the dyes are obtained from local plants or trees.

The joiners employed in the districts were almost all Beharis and the carpentry school was started to train hill lads. It was begun in 1905. There is now a keen desire to take up carpentry and within a few years the supply of hill men should be sufficient for the ordinary work of the district.

This department grew out of the need of workers to make up articles for which lace, embroidery and crochet are required and now a large and rapidly increasing business is being done in household furnishings and ladies' garments. The apprentices are boys. Tailoring.

Silver work is encouraged and an effort is being made to utilise local designs and develop the Tibetan and Nepalese artistic models.

Turkey rearing was introduced into the district by the industrial school and now there is a considerable export of fat Christmas turkeys to Calcutta and other places, the arrangements being made by the school.

All the workers of the central school must attend literary classes as well as take part in the various industries. The women and girl workers (lace, embroidery, weaving and dyeing) go each morning for 1½ hours to the Mission Girls' Upper Primary School. In this way all become literate. Similarly the boy apprentices in the carpentry and carving, weaving and tailoring departments have 1½ hours book education in the middle of the day in a special school of their own. (It may be interesting to note that the pupils of the ordinary girls' upper primary school go, in their turn, to the industrial school for 1½ hours each morning to learn lace and embroidery.) Educational basis.

At the beginning, scholarships were given to women workers to encourage them to make a start with the industry. Now these are in but few cases required and work. (except in cases of girls coming from a distance to study for a short time or in some special circumstance) payment is strictly for work done. The school supplies all materials and gives fixed rates. This applies also to boy apprentices in the tailoring and weaving departments whose apprenticeship lasts for 5 years. In the carpentry and carving school the period of apprenticeship for all boys is also 5 years. The boys in it begin with scholarships of Rs. 5 a month which is increased by 8 annas every 6 months. The school gives diplomas to boys at the end of their apprenticeship to satisfactory apprentices. The women workers get diplomas (junior, senior and teacher grades) whenever the excellence of their work warrants them. Conditions of

The ultimate aim of the industrial school is to found cottage industries which will become indigenous to the district. The pupils who leave are encouraged to continue the work in their own houses, materials are supplied to them and they are paid for their work at the same rate as in school. The school takes the responsibility of selling the goods made. Outside workers.

A beginning has been made with branch lace and embroidery schools throughout the district. These are conducted by ex-pupils of the central school and are run on the same lines as to work, education and payment. The success of the few already established had led to the adoption by the Director of Public Instruction of a scheme for the founding of an industrial school for girls, as far as possible in connection with each primary school in the district. Girls' education is backward. The mass of parents will not spare their girls merely for book education but they are encouraged to do so when their girls can earn a little and Branch schools.

learn an industry while becoming literate. The women teachers who are now being trained at Kalimpong are consequently being prepared to teach an industry as well as in literary subjects.

Foreign pupils.

The industrial school has received a considerable number of pupils from other parts of Bengal, from Bihar and Orissa and from Assam to be trained for industrial work in these provinces.

Financial arrangements.

The aim of the school is to make the various departments self-supporting as regards the industries themselves. This was not possible in the initial stages while the workers were raw and the experience limited but it can be claimed that the industries are now self-supporting as the statistics given below will show. The educational element in the school is naturally a charge to be borne by the school helped by a Government grant. All along an effort has been made to give a fair living wage to the workers and to charge accordingly for the goods produced. Had the school possessed a working capital the progress would have been quicker.

Disposal of goods.

The goods are disposed of by (a) local sales, (b) sending boxes on approval to all parts of India, (c) sales of work in such centres as Darjeeling, Calcutta and Simla, (d) sales in Britain and the Colonies through private parties. As the industries grow, additional means will have to be used for the disposal of the goods.

Statistics for 1915-16.

	Lace.	Embroidery, etc.	Weaving.	Carpentry and carving.	Tailoring.
Central school workers . . .	101	44	63	57	17
Workers in own houses . . .	69	73			
Workers in out schools . . .	31	11			
TOTAL . . .	201	128	63	57	17

	Lace.	Embroidery and tailoring.	Weaving.	Carpentry and carving.	Miscellaneous (Poultry, etc.).	Total.
	R	R	R	R	R	R
Receipts . . .	8,881	9,208	4,660	6,712	1,690	31,141
Expenditure . . .	9,391	10,697	5,211	5,726	1,100	32,125

Receipts and expenditure for actual industries, *i.e.*, receipts for sales of goods and expenditure on materials and workers (neglecting all items such as Government grants and educational and organising salaries, etc.) was as follows:—

	Lace.	Embroidery and tailoring.	Weaving.	Carpentry and carving.	Total.
	R	R	R	R	R
Receipts (actual sales) . . .	6,716	8,638	3,761	6,196	25,301
Expenditure (workers' wages and materials). . .	6,576	8,255	3,451	5,175	23,457

NOTE.—Stock in hand showed, *in addition*, increased values:—

Lace R386, embroidery, etc., R1,130, weaving R790, on the other hand the carpentry stock decreased in value by R243.

Cottage industries in Bengal.

The above sketch of the aim and work of the Kalimpong Mission Industrial School has been given as it is believed that something on the same lines might be carried on with advantage in many other parts of Bengal.

An industrial school can only be successful if it seeks to introduce or stimulate *bona-fide* industries and if it carries on its work on a sound commercial basis. The improvement and the development of already existing local industries (where there are such) would be the natural and probably the most satisfactory object of the school.

We consider the combination of literary and industrial education all important. At the present stage of female education, the combination is of special moment from an educational point of view.

The apprenticeship system for boys and the provision, at the expense of the industrial school, of literary education is the one to be adopted. At Kalimpong the apprentices in weaving and tailoring (who are paid by results even during apprenticeship) get an allowance of R1-8 a month to make up for their 1½ hours spent in acquiring the literary education. On the other hand they are fined if they do not take advantage of it.

There is a clamant need for organisation to encourage home industries in Bengal.—

In his review (page 6) of the industrial position and prospects in Bengal in 1908, Mr. J. G. Cumming wrote regarding the improvement in indigenous handicrafts :—

A Bengal home
industries associa-
tion.

"After six months special investigation, during which I have examined industries in twenty-six districts, it appears to me that what is now required is not the teaching of the existing methods in cottage industries, but the teaching of improved methods, and also the assistance of the educated upper-middle classes in a more organised system of production and distribution. Mechanical power or in some cases, an improved adaptation of human power is required. An acute observer, representing the United States Government, has recently reported to Washington that the *swadeshi* movement must recognise that this is the age of machinery all over the world. The artisan must not be left to himself to obtain his raw materials, to produce an article and then sell the completed product. Also I hold that industrial schools outside of a commercial atmosphere and without highly qualified teachers are futile, and that enthusiasm without money and business-like methods is vain."

Government can do much through the proposed Director of Industries, the Registrar of Co-operative Societies, Museum authorities, Schools of Art, and District Officers to encourage home industries.

What is wanted above all at the present time is a strong association for the promotion of home industries in Bengal with branches in every division if not indeed in every district. Such an association should unite the best Indians and Europeans in the province, should seek to create a living interest among well-to-do people in home industries, set the fashion in the use of their products, guide the producers as to the models they should follow, co-operate with Government officers in the organisation of the industries, advise as to financing, help with arrangements for the sale of goods by co-operative societies, private effort, sale depôts, etc., organise sale depôts in Calcutta and the larger towns and perhaps in Great Britain and the Colonies, encourage research on the subject of past, present or possible new industries, take steps to give full publicity to all information, hold stated meetings for lectures and discussions on subjects bearing upon the home industries of Bengal (the Arts might also be included), etc., etc.

Such recruitment of the well-to-do people of Bengal in the interests of home industries is to my mind an essential for any great development. I feel sure it would be successful at the present time and that a true *swadeshi* movement guided by the best Indian and European citizens would have a most beneficial effect.

To pay the salary of the necessary organising agent or agents (none but first-class men or women should be engaged) and to meet other expenses, a considerable sum would be needed, but I believe that ample funds would be forthcoming from patriotic citizens and from annual subscriptions from the numerous, widely distributed membership of the association. It would not be unreasonable to expect a yearly subsidy from Government.

My conviction of the value of such an association is based not only on the needs of Bengal as a whole but also on the increasing need of the Kalimpong Industrial School which would be greatly helped if the taste for its industries were encouraged among the people of India and a wider constituency were secured for its wares.

ORAL EVIDENCE, 28TH NOVEMBER 1916.

President.—Q. You have been very kind in giving us an account of what you have been doing at Kalimpong. I am not going to ask you any further details. But as you are dealing with questions connected with industrial schools I should like to know whether you have thought out the question as to how it would affect the young boys living in Bengal if they were sent to fairly large towns for industrial education. Are they likely to come back to their villages and take up their calling, or is it likely to upset their family connections to any serious extent?—A. I am afraid I have no personal experience whatever to guide me in giving an answer and anything I can say would be what I imagine would happen. We have no big centres with us such as you mention.

Q. You are really dealing with a very special class, are you not, people who do move about very freely?—A. They do.

Mr. C. E. Low.—Q. Towards the end of your note you propose an association for the promotion of the home industries of Bengal with branches all over the province. What would be their relations to the Director of Industries?—A. I should think it would be one of very close co-operation in the matter of bringing the people of the province more into touch with him for the carrying out of his suggestions.

Q. Supposing there was a difference of opinion whose views would prevail?—A. I should think the Director of Industries' would.

Q. Would they have any executive functions and budgetted funds of their own to dispose of independently?—A. I should hope so.

Q. And they will dispose of these funds on their own motion. I mean funds provided by Government?—A. I should think that Government should see its way to support them by a grant. But Government would have the whip hand by refusing the grant in case they felt that they did not use it carefully.

Q. For the purpose of propaganda work and the purchase of the products of these industries or the actual starting of new industries?—A. I should think that money would mostly be required by the association for propaganda work.

Q. For working up a market for the industries?—A. They would have a depot or depôts which should be on a commercial basis and they would have the organisation to advertise this throughout the district and bring people into touch with them.

Q. Would you like the Director of Industries running it on his own account or would you leave it to the association?—A. I think the association would do it better than the Director of Industries as a whole. It would create popular interest.

Q. Do you think that an association of that sort will give a useful stimulus to bring out capital for small industries. I do not mean cottage industries. The Director might obtain the advice of the association to induce people to subscribe shares and so on?—A. I did not think of it from the point of view of any factory industry. The association would have on its conscience the development of the cottage industry side.

Q. You are no doubt aware that co-operative organisation and finance are likely to be very important for cottage industries. What would be the relations of this body towards the Registrar of Co-operative Credit Societies and his staff?—A. I should think that the co-operative banks might in many cases be used as branches of the association or the association would work through them. My own feeling is that this association would not have any kind of official position at all. It will try in every way to stimulate industries and it would work entirely in conjunction with the co-operative movement. The great object is to get in every district men who would feel their responsibility, think out what it might be possible to do, give help in pushing new industries or developing old ones. It will create a sentiment in the minds of the people.

Q. Do you think that interest could be elicited and sustained in the working of such a body?—A. I think so. Certainly if you had one or two enthusiastic men.

Honble Pandit M. M. Malaviya.—Q. How many boys and girls have you got in your industrial school, roughly?—A. We have 200 working at lace. 128 embroidery women and girls. 68 weaving, that is both men and girls.

Q. Do you receive any Government aid for the school?—A. We have hitherto received Rs265 a month. That recently has been increased with a view to enabling us to get an expert lady for weaving tweeds.

Q. Do you think the boys and the girls will be better able to benefit by the industrial teaching if they come to you after finishing their elementary education, or after you have put them through a course of elementary education in another school?—A. There is no doubt that it would be better if it were feasible. But at present we just seek to meet the conditions that we have there. Our present system seems to be the only possible way of doing it.

Q. But you think that it would be better if it were feasible?—A. I think it would be better if we had reached that stage of education.

Q. With regard to this association, suppose the Director of Industries was made a member of it and the association were left to decide as to the application of funds, would that not be better for promoting industries in the district where the association would work?—A. I should hope so.

Q. What I mean to ask is this. Would it not be better for the association to keep with itself the power of deciding in what directions they will work rather than leave the promotion of industries in the district to the Director who is at a distance?—A. I think it will be better if the association could have its own initiative. It would just be the hand-maid of the Director.

Q. There should be co-operation?—A. Success would depend on that.

Q. Is there any co-operative society in your district?—A. Yes.

Q. For what purpose?—A. For agricultural purposes at present.

Q. Not for industrial purposes?—A. No. But we shall have one for weaving shortly.

Q. If you had a co-operative society for industrial purposes that would greatly help industrial development?—A. I certainly think so. It is one of the great hopes of the future.

Mr. A. Chatterton.—Q. I understand that yours is rather a special kind of industrial school. It is only for the promotion of home industries?—A. Yes.

Q. What do you exactly mean by a home industry as compared with a cottage industry?—A. To my mind it is the same thing, home or village or cottage.

Q. You do not mean by a home industry an industry which is carried on in conjunction with some other industry in spare time?—A. That may be so. You have for example lace or embroidery. They have been done by people at home in their spare moments. They are also done by others who give their whole time to it.

Q. You do not distinguish between the two?—A. No.

Q. This association that you would like to see promoted is not exactly on the same footing as associations at home, such as the Irish Home Industries Association?—A. I think as far as it goes it will be on the same lines. I could imagine the association having a very much wider scope. But things are not so very developed in India.

Q. Here in India the cottage industry is enormously developed. Would you bring the whole of this great industry into the scope of the association?—*A.* In so far as the association thought it could do anything to develop and help it.

Q. Or would you confine the work of the association to popularising products, that is finding markets, etc.?—*A.* That would be an important part of the work. We would like to have meetings, discussions, etc., as well.

Q. Instead of including the whole of the cottage industries of Bengal, would you confine yourself to dealing with the particular class of industries that are taught at Kalimpong, that is lace, embroidery, etc.?—*A.* That would be a very small part of it. We first of all began with an idea of a lace association for Bengal. We have had a lot of pupils coming to Kalimpong sent by the various Missions and Municipal Boards and there is the difficulty of getting the things sold. So the thought of a wider association has grown up in our minds. If it is good in the case of lace why not do it for all? There is at present a spirit all over Bengal to foster the home industries.

Q. If the association starts with such a wide scope it may do very little. If you could have a more limited sphere you might do a great deal. How long has your school been in existence?—*A.* Since 1905.

Q. Have you any record of what has become of the pupils after they leave the school?—*A.* Yes. Take the lace school. They go out into their own homes and many of them continue the work when they go to the districts.

Q. When these girls get married do they still carry on the work?—*A.* Some drop out. Some carry on.

Q. With regard to the disposing of the goods is there not in England already an association or a depôt established by the Missions for the sale of its home-made goods?—*A.* I do not think it is very active now.

Q. Do you want to develop that idea of having a depôt in some place like London or wherever there is a large market?—*A.* I think that if the village industries or home industries of India (not only of Bengal) had a big depôt in London it would be a very good thing.

Q. That would be one of the functions which the association wants to work up to?—*A.* Yes.

Q. Have you made any attempt to get orders from commercial firms in connection with the manufacture of lace and embroidery?—*A.* Yes. Of course it pays better to have goods sold under private agency. As the industries grow we shall have to work more through commercial firms.

Q. The only other question that I wanted to ask you is with regard to what you say about the combination of literary and industrial education. You would not apply that to the education of artisans in industrial schools in other parts?—*A.* I have not very much experience outside our own district. My belief founded on our own experience is that if the apprentices have not passed through part of the elementary course, they can profitably combine literary and industrial education.

Q. Let us assume that they get education somehow. Is that not better?—*A.* Yes, if they have got it. But the greater number of artisans have had no education.

Q. At Kalimpong do you find any difficulty in carrying it on satisfactorily?—*A.* None.

Q. How much time do these boys attend?—*A.* 1½ hours during the day.

President.—*Q.* Would you like to make any supplementary statement especially with reference to this association? Would you expand that idea? Who will undertake the lead? It is a question of working out a practical scheme?—*A.* I believe it would be a good thing for the development of this association that the membership should involve with it a subscription and I believe we can get people who know the conditions of Bengal to co-operate. I do not think there will be any difficulty in getting a thousand men in Bengal who would contribute 5 or 10 Rs. a year. A smaller number who will give larger sums will become life members.

Mr. A. Chatterton.—*Q.* It appears important in some ways to devise a scheme of education for Anglo-Indian children which will raise them from their present depressed condition, especially among the lower classes of them. I understand that there are no Anglo-Indian children in your school?—*A.* It is entirely for hill people.

Q. You do not consider that these cottage industries and home industries would be suitable for Anglo-Indian girls. Would it be possible to put them on?—*A.* We are trying to get them as teachers. I do not think that the average Anglo-Indian girl would make anything like a living wage. For the Anglo-Indian boys, I believe apprenticeship is far the most useful avenue for them.

Q. Do these Anglo-Indian boys get into workshops as apprentices?—*A.* They get into railway workshops. We send them to Calcutta.

Q. You do not attempt to put your Anglo-Indian boys to a course of manual training or workshop practice?—*A.* Except in farming. We have sent some to New Zealand.

**Q.* Are many going?—*A.* We have sent 27.

WITNESS No. 82.

Dr. P. C. Roy, *Director, Bengal Chemical and Pharmaceutical Works, Calcutta.*

WRITTEN EVIDENCE.

Cottage industries.

In India special attention should be given to the development of cottage industries. There are cottage industries which will stand the competition of factories. In fact there are many such industries in which no competition exists at all; such as fine cotton and silk weaving, carpet weaving, pottery, carpentry and the artistic industries such as gold and silver work, ivory carving, metal inlaying, clay modelling, stone carving, lace making, lac work, etc.,—industries which still flourish in India. It is necessary, in the best interests of the country, to develop them by introducing labour-saving contrivances amongst the artisans and by offering them money at cheap rates of interest. For the latter purpose the spread of co-operative societies on the Raiffeisen model is needed. The village artisans will welcome any cheap machine or new process which will help their work. The only thing necessary is that the utility of the particular implement or machine should be demonstrated before them. The Commission should not neglect this important branch of industry, *viz.*, the cottage industry. The welfare of numberless people is bound up with the development of this branch of industry.

Government assistance.

The Government should help the development of industries by (a) the grant of financial and other aid to existing industries (b) by starting pioneer and demonstration industries.

The great object is to induce the people to become industrialists. The policy of abstention and aloofness of Government advocated by English economists will not do in India. The policy pursued in Japan ought to be followed.

The initiative of Government is justifiable when a particular tract is favourable to the starting of a new industry but the people from want of industrial skill and enterprise have not attempted it. The Government may also help an existing industry by suggesting new processes or new mechanical appliances of which the promoters of the industry are ignorant.

This policy was tried with success in Madras and the United Provinces. The aluminium industry in Madras and the sugar industry in the United Provinces are appropriate examples.

The silk, indigo, sugar and tea industries were all fostered by Government in British India.

It cannot be said that the policy of direct aid by Government is new. Some of the Native States have liberally helped private enterprises.

Financial aid.

In giving financial aid the several methods suggested in question 5 should be kept in view. In several cases combination of two or three methods may be necessary. There cannot be one uniform method for all. Each particular industry will be helped according to its requirements.

The great principle in giving financial aid is that only the deserving industry should be helped. By deserving is meant an industry of which the promoters have studied the local conditions and shown considerable honesty and skill in the conduct of business and are in a position to make it successful by a timely aid. Aid to incompetent and ill-conceived ventures is to be discouraged. An industrial concern before it seeks for Government aid ought to show that it deserves it by its *bonâfides* and good management. The initiative should, as a rule, come from within and not from without.

Sometimes the only aid which a particular industry will require will be expert advice or arrangement for the supply of raw materials. The Match Factory at Tollygunge has no supply of wood for match. But the Government plantations in Darjeeling have got the kind of wood. Yet the factory does not get them in spite of repeated representations to the authorities.

The ways in which the Government may help an industry are numerous and do not consist merely of financial aid. The finding of a market for locally manufactured goods is one of them or the supply of an essential ingredient on favourable conditions as supply of alcohol to a pharmaceutical factory. It is a notorious fact that the nascent industries are greatly handicapped for want of a suitable market. The local traders demand high rates of commission and throw other obstacles in the way. They push the foreign manufactures of which the supply is abundant and try to force most unreasonable conditions on the home products.

It goes without saying that Government should exercise some control over industries which it helps. The least objectionable way is by an independent audit by Government and by periodical inspection. The appointment of Government Directors may cause friction.

Pioneer factories.

Whenever a pioneer industry has been established on a good basis and there is offer of purchase by an individual or a private or public company, the Government should part with it. Preference should be given to companies. But it is desirable that the Government should exercise some supervision for some years after purchase.

The purchase may be effected on the annuity system, the Government retaining some control till the last annuity is paid. This system will not impose undue burden on the purchaser.

The Government should pioneer the following industries: lac, tobacco, sugar and chemical industries for the manufacture of glass, bleaching powder, alum, bichromate of potash, permanganate of potash, soda, etc.

The industries which can best be developed by co-operative societies are handicrafts and small cottage industries and agriculture. The demonstration of the use of small machines or of processes in home industries may well be tried by the co-operative societies with the help and guidance of Government officers.

The Government may avoid the highly organised industries as a jute or cloth mill. But smaller industries and industries which are new to the place and will not compete with an existing industry ought to be taken in hand by the Government. This will not discourage private enterprise. For the latter may wait and purchase the Government concern or have an industry in co-operation with the Government. The demand for a particular product may be great and there may be room for many concerns of a similar nature. Suppose glass factories are started both by Government and a private company. The latter may manufacture the cheap articles and the former only try articles of a superior finish.

The Government should not hesitate to aid or start a new enterprise even if it competes with an established external foreign trade. For in that case no pioneer industry could be started in India, as there is a foreign trade in almost every article of ordinary use.

My province is at present in need of demonstration factories for the manufacture of glass, sugar, alcohol, tanning materials and leather and porcelain.

The Government should encourage the deputation of experts engaged in private enterprise to England and foreign countries to enable them to gain technical knowledge which they are in need of. It should be made a rule that in awarding scholarships for technical education preference should be given to those who are engaged in a particular industry or who have shown competence by possessing practical knowledge of the local industries.

The industrial schools are greatly handicapped for want of facilities in practical training in factories. The Government should offer such facilities.

The industrial schools should be under the joint control of the Department of Industries and the Department of Public Instruction.

Our country is in need of night schools for the benefit of artisans.

There are private technical schools. The Government should properly recognise them and afford reasonable facilities wanted by them.

Industrial schools should be established all over the country. Besides arrangements should be made for manual training in the existing secondary schools. Students may be required to choose a career after some years of study. They should elect either to pursue their career in the ordinary secondary school or join an industrial school. It is no use having "B" standards in ordinary secondary schools.

The great defect of existing technical schools is the inadequacy of practical training. This can only be acquired in factories. Passed students of technical and industrial schools should be taken as apprentices in factories and workshops.

An advisory Board of Industries is preferable.

The Director of Industries, if one is appointed, should be a business man with general scientific and technical education. He need not be an expert in any particular industry. In no case should an executive officer having very little experience of business or industry be appointed to the post.

The scientific and technical departments of the Government should be organised on liberal lines by which Indians may be benefited.

Qualified Indians find it difficult to enter these departments. Unless better facilities are offered for the admission of Indians who possess the necessary qualifications and are intimately acquainted with the needs and conditions of the country, the departments will not be of much help to the growth of industries amongst the people of the land.

The Institute of Science is located in a place quite out of touch with industries and beyond the pale of public opinion. There is no proper controlling authority. It is a matter of regret that vast sums of money have been lavishly and I would almost say recklessly spent, not commensurate with the real work taken in hand. But still it is premature to pass any opinion on its future. The technological researches on raw Indian products should always be carried out in laboratories established in Indian industrial centres as much time is lost in the transmission of raw products abroad and communication of results. Moreover this would have the effect of giving opportunities to Indians being trained under proper expert European supervision. Research Institutions have their great value in highly developed industrial countries. But in a backward country like India what is more required is the direct encouragement of industrial habits and enterprise amongst the people by the starting of pioneer and demonstration factories than by establishing highly developed technological research institutions.

Official organisation.

Technical and scientific departments.

Commercial
intelligence.

The Commercial Intelligence Department should publish monographs on industries and distribute them free of cost. The translation of these monographs in vernacular is desirable. It will be profitable to have a quarterly journal embodying these writings.

General.

In order to give better facilities for the training and employment of Indians the workshops in connection with railways should be thrown open to them and Indians should be engaged as apprentices in higher engineering work. Dockyards might also be established in such ports as Bombay and Calcutta for the building of steamers, *e.g.*, navy. This will give an opportunity to Indian engineers being trained in naval architecture. This was the scheme adopted by Japan in the early stages of her renaissance in the seventies of the last century.

I should also suggest that some of the river courses in lower Bengal might be reserved for Indians for gaining experience in steamer navigation, *i.e.*, protected from competition by powerful European companies.

ORAL EVIDENCE, 28TH NOVEMBER 1916.

Mr. C. E. Low.—Q. You are Director of the Bengal Chemical and Pharmaceutical Works?—A. Yes.

Q. Is it a limited company?—A. Yes.

Q. What is the capital?—A. Five lakhs.

Q. How much is actually paid up?—A. Almost the whole amount is paid up.

Q. Your works are in Calcutta?—A. In the suburbs.

Q. Have you been a Director of it since it was started?—A. I have been connected with it from the beginning. It was started as a private enterprise and converted into a limited liability company some time in 1903. And as I am a Government servant I was not then in the directorate but of late I have been in it.

Q. What are the particular articles which you manufacture, speaking broadly?—A. Various kinds of medicines and acids and scientific instruments.

Q. With reference to the first part of your evidence, what do you consider should be the functions of the provincial Director of Industries in respect of cottage and organised industries, respectively. Do you think that the Provincial Director of Industries should deal with both?—A. Our people are so very poor and we have got so few industries worth the name that utmost efforts should be made not only to revive but keep alive these existing cottage industries.

Q. You point out the help which co-operative societies could give to cottage industries. Do you allude especially to credit or to purchase and distribution as well?—A. Both loans on favourable terms and also supply of raw materials.

Q. Do you think that sufficient money would be forthcoming to finance these co-operative industrial societies?—A. It depends on circumstances. If the products find a ready sale then of course money would be forthcoming. But if it is found that borrowers are unable to pay back their loans, then there will be difficulty as regards the flow of capital.

Q. That would depend firstly on the industries being properly selected and secondly on the members being properly selected?—A. Quite so.

Q. What should be the relations between the Director of Industries and the Registrar of Co-operative Societies?—A. That is very difficult to say off-hand. I have thought about that a good deal. But I am afraid I have not been able to come to a definite conclusion. I find there are departmental jealousies. One head of one department does not like the idea of his being interfered with by the head of another department. Harmonious working and smooth relations are not always easy to get at.

Q. Would you consider it a suitable solution if the Registrar of the Co-operative Societies dealt with the business side and the Director of Industries with the technical side?—A. I think that it would be a better solution and it would remove a good deal of friction.

Q. You speak of the match factory at Tollygunge suffering for want of wood and you say that the Government plantations at Darjeeling have the kind of wood required. Do you know about this personally?—A. I know a good deal about it.

Q. Is the wood at Darjeeling accessible?—A. I am afraid not. That is the difficulty.

Q. It is not the difficulty of price. It is only the question of transport?—A. It would be cheaper to get it from Australia than from these inaccessible hill regions.

Q. Leaving aside the cottage industries, with regard to what I may call the small factory, do you consider that, if technical advice could be given on the part of Government, if Government experts could examine the thing thoroughly and place before the public the results of those experiments showing the possibility of running the industry at a profit, capital would then be forthcoming to start such a concern?—A. I think our countrymen are beginning to realise that capital is no longer shy even in Bengal.

Q. Presumably capital would be more easily forthcoming locally in respect of small local factories?—A. Yes.

Q. I mean to say that the people of Rangpur would be more ready to subscribe to a tobacco factory in Rangpur than to some factory in Chittagong?—A. Yes.

Q. Do you think that fairly substantial amounts would be forthcoming?—A. I think so.

Q. When I say that Government experts would examine the thing, of course Government^t would not take any responsibility. They will advise to the best of their information?
—A. Yes.

Q. Would you explain exactly what is meant by the B standards of secondary schools?
—A. Sometimes these so-called technical schools are a misnomer. Sometimes a carpenter or a village smith is engaged and that is all the help that the boys are able to get.

Q. What is its equivalent in the ordinary course?—A. Side by side with the ordinary education we have the lower primary, the upper primary and then the secondary schools. The teaching is up to the matriculation examination.

Q. Do you know whether any of the B standard boys go on to the University afterwards?
A. Most of them go because they are not absorbed in any of the industries in this country.

Q. Is it regarded as an easier path to matriculation than the ordinary literary course?
—A. I think that what is called the *bhadralog* or middle class feel a kind of repugnance to manual work but as competition is very keen, they are now taking kindly to such things.

Q. Returning again to the B standard, I understand it gives an industrial bent to ordinary education?—A. Yes.

Q. But generally both officials and non-officials consider that it is inefficient and unsatisfactory and leads to no good results?—A. If they are apprenticed to railway workshops or such firms as Burn and Co., and Martin and Co., I think it may lead to good results.

Q. Is there any difficulty in obtaining free entry into these firms for apprentices?—A. My impression is that it is somewhat difficult. For instance, the railway workshop at Jamalpur might give better facilities for the admission of students.

Q. Do they confine their apprenticeship to the sons of people already in the works or in what way are they restricted?—A. I think the average Bengali young man belonging to the higher classes has not the facilities that might be desired.

Q. Have you heard instances of such men having applied and their being refused?
—A. I cannot tell that exactly. But that is the general impression.

Q. Do you consider that technical schools are capable of creating industries?—A. That is a very difficult question. In Bengal we are so very backward in commercial enterprises and business capacity that we cannot all on a sudden expect men from these technical schools to engineer big industries. They might be absorbed in industries which are already extant. But with only their help to start big industries would be a rather dangerous experiment.

Q. Do you think that industries should precede technical training?—A. They ought to.

Q. You say an Advisory Board of Industries is preferable. Preferable to what?—A. To a Director of Industries.

Q. By Advisory Board you do not mean executive board?—A. By Advisory Board I mean a board which has studied local conditions about the supply of raw materials and the demand for manufactured products and so on. They would start industries only after making the right kind of enquiries and experiments. For instance the match factory at Tollygunge. My view is that the experts should have taken ample care to see that the supply of timber was readily available on the spot. An Advisory Board would have helped in cases of this sort. They would have been able to warn the organisers that they were running a risk in starting the factory under the conditions. They would also advise as to the suitability of an industry to a particular locality.

Q. Who would constitute the board?—A. Men concerned with the Commercial Intelligence Department who could get the necessary information.

Q. People with expert knowledge, you mean?—A. Yes.

Q. Experts in industries and in business?—A. Yes.

Q. Who would control these various experts?—A. That is a difficult matter to pass an opinion upon.

Q. After all that is an administrative question on which perhaps you are not in a position to give an opinion off-hand. You say on page 2 "In a backward country like India what is more required is the direct encouragement of industrial habits and enterprise amongst the people by the starting of pioneer and demonstration factories than highly developed technological institutions." To what extent do you consider that factories were started without research?—A. I mean glass factories, for instance. There is also the aluminium works which was started in Madras under Mr. Chatterton's direction and advice. Such enterprises might be started.

Q. You think there is a substantial amount of industrial work and opportunity which could be made use of by means of knowledge in the possession of certain persons already, to be obtained for the purpose?—A. Yes.

Q. Take for instance the glass expert. He comes here from some other country. He finds some differences in the quality of the sand which leads to results different from what he has been led to anticipate from experience with materials apparently similar in the country from which he comes. We have all seen instances of failures of industries owing to that cause. How do you propose that this difficulty should be got over?—A. India is a vast country and the supply of raw materials can be secured from several provinces. The

Geological Department and the Commercial Intelligence Department could give very valuable information. I believe that at Titagarh the company failed because of the want of experts. Experts were brought out from Germany. They suffered from malaria and then went away. In such cases Government might come forward with the help of a fresh supply of experts. I have often observed with regret that the so-called experts have been instrumental in leading people astray. They come back from Japan and the United States with a superficial knowledge of the subject and they do not collect the necessary local information. They start the work and find out the difficulties in the way when it is too late.

Q. What is to be done to adapt the knowledge of experts who are not fully acquainted with local peculiarities, which means all the difference between success and failures. How is that small amount of very necessary knowledge to be obtained. You must have a certain amount of research facilities?—A. Suppose a glass factory is started. First the experts should see that sand, soda and coal are available near at hand. Of course soda we have to import for the present. I have known cases where a glass factory has been started far from the supply of coal and the carriage of coal has proved prohibitive. They should have taken care that the glass factory was initially located in a place where the supply of coal was the first consideration. I find often that they realise their mistakes when it is too late.

Q. In connection with the Bengal Chemical and Pharmaceutical Works, you were not able to start it without a good deal of research undertaken by yourself. Don't you think that has made a good deal of difference in the matter of the success of the company?—A. Work like this is based almost entirely on research, preliminary research work.

Q. I suppose you are still going on with your research work and are constantly trying to open out new lines of business?—A. We have a body of chemists, of whom one or two are entirely detailed off for research work.

Q. You generally direct the lines on which they should do research work with reference to what you consider commercially profitable business?—A. Yes. We are very keen about securing the best scientific men available. We do not take any one who is not an M. Sc. of the Calcutta University or who has not got knowledge of that Standard.

Q. You are in a position to find out whether a particular man is suitable?—A. It is left to me to decide. 99 per cent of our graduates are theoretical bookish men and one has to be very careful in selecting a proper person. He may score very high marks in the university examinations, he may get even a first class but he may be poor substitute in business. Whereas one who is a third class graduate may be very good as a business man.

Q. And therefore you say that the existence of a man with a scientific training in high control of an industrial concern is often a very great advantage?—A. Yes.

Q. Have you ever had any experience of the working of the commercial museum?—A. I know our firm is in frequent communication with it and often gets very valuable information.

Q. Supposing these commercial museums were made provincial, that is to say, if similar museums were started in other provinces do you think it would be a useful advertising medium for Indian industries?—A. I think so.

Q. Do you think it would help you in the matter of sales?—A. Yes.

Hon'ble Pandit M. M. Malaviya.—Q. You say that it is necessary in the best interests of the country to develop these cottage industries by introducing labour-saving contrivances among the artisans. Would you recommend the lending of machinery on the hire purchase system?—A. Yes. That would be a very desirable thing.

Q. Then you say that demonstration factories would be of very great use? Would you have these demonstration factories only at the headquarters of the districts or also in the sub-divisions?—A. I would have them even in the remotest villages. For instance, take the extracting of juice from cane. The poor villagers have very crude ways of doing it. If a not very costly apparatus were brought to them and its use explained they would be the first to purchase it. Even, they would go into shares and purchase it.

Q. Do you think that there should be arrangement, made for making demonstrations from village to village or groups of villages all over the province?—A. Yes.

Q. It is a fact that the match factory applied for wood from Darjeeling but was not able to get it?—A. I think Mr. Mitter who has been cited as a witness will be able to give you better information about it than I can.

Q. You recommend that students who have passed through the technical and industrial schools should be taken as apprentices in factories and workshops and you recommend that Government should make it a rule that workshops and factories which are patronised by Government should take in a certain number of apprentices?—A. That is what I suggested in a note which I submitted to Mr. Swan. I quoted very largely from a book published in Japan by the Principal of the late Engineering College in Tokyo (Mr. Dyer). He says that in the seventies they sent out the first batch of students who came out of the engineering college to Sir William Armstrong, and they made a conditional order to the firms who made their battleships that no order would be placed with the firms unless they took in a certain number of apprentices. The Secretary of State commands vast influence and patronage and he might well afford to dictate terms to the firms so that a certain number of apprentices may be taken.

Q. You mean that the Government should arrange for it?—A. I feel very strongly on the subject. And my view is that Government has been rather backward in this respect.

Government might very easily arrange for it. They might say to the firms that no orders would be placed with them unless they took in a certain number of apprentices. That would bring them to their senses.

Q. You have seen the report of the Morison Committee. They have made a recommendation to the effect that the Secretary of State should exercise his moral influence to secure the object?—A. I should say not merely moral but direct influence. He can bring pressure to bear on the firms. He can afford to dictate terms. He need not go a-begging.

Q. Do you mean that unless he made it a stipulation they would not take in apprentices?—A. He commands huge influence and patronage. You know well how many millions worth of stores are bought through the India Office.

Q. You say that qualified Indians find it difficult to enter the scientific and technical departments of Government, and recommend that better facilities should be offered them. One of your recommendations is that such a difference as exists in the Indian Educational Service should not find a place there?—A. It should not. More of them should be taken in the scientific departments of Government like the Geological Survey and the Trigonometrical Survey. One reason why I say this is that other things being equal when an Englishman completes his 55th year, he retires, and all the technical and expert knowledge he gained in India is lost to India for good. Whereas if he were an Indian he would have resided in India and his expert knowledge would have been available to the Indians. Now I can illustrate this in my own case. I am about 55 and I am about to retire. If it pleases God to spare my life I would say that my advice would be absolutely at the disposal of my countrymen as long as I live. In the case of Europeans that knowledge is lost to the country.

Q. You say then that in these scientific and technical departments, which you recommend should be developed, Indians should have fair play?—A. Yes.

Q. You also say that Indians should be taken more and more as apprentices. Are not the students of the Sibpur Engineering College taken as apprentices in higher engineering? Are they not put through a course of practical training?—A. I think they are, suppose a bridge is constructed they are put on there. Sir R. N. Mookerjee would be able to give better information on the point.

Q. You say that research institutions have their great value in highly developed industrial countries. Did I understand you to say in answer to the President that you are not opposed to the higher kind of research?—A. I have spent the best years of my life in research and I should be the last man to decry it.

Q. You think that knowledge that is available in the matter of industries should be more widely diffused and utilised in the country in the promotion of enterprise and that research should accompany the growth of enterprise?—A. Yes.

Q. You have said that Bengal is industrially backward. Would you kindly let me know the reason for it? Bengal is not deficient in intelligence, and in every line of study that has been provided the Bengali has distinguished himself, in arts, law, engineering, medicine. Is not the industrial backwardness of Bengal due then to the fact that the system of education in vogue has been of an unindustrial kind so to say, that it is too literary and theoretical?—A. There are also other reasons such as the permanent settlement and the fertility of the soil.

Q. Do you think that if you had higher technological institutions and colleges of commerce to impart industrial and scientific education, there is no reason why the Bengali youth should not distinguish himself as well in these lines as in others?—A. Mere technological institutes will be of very little use. The Bengali have very little forwardness at present in the matter of commercial enterprises. On the Bombay side we have mill-owners who have never been in any technical or commercial institute.

Q. You recommend the establishment of industrial schools. Do you think that a general system of primary education should be the basis of industrial education?—A. It should be.

Q. Don't you think that the lack of general elementary education is a hindrance to industrial efficiency?—A. It is.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Will you tell us why the chemical works of which you are a Director was exchanged from private ownership to a limited company?—A. We could command very little capital. To tell you the full history would be to repeat a chapter in my own biography.

Q. Was it not working profitably under private ownership?—A. It was working profitably. It was found that the proprietors could bring in very little capital.

Q. Is it working profitably now?—A. I think so.

Q. What dividends?—A. 8 per cent. The Directors want to give more but I am using my moral influence in restraining them.

Q. If new industries are started they require big chemical work and capital just like America?—A. Yes.

Q. Don't you think that they are first essential before we start many new industries?—A. Yes: take for instance the Sunlight Soap Company of Messrs. Lever Brothers. It commands a capital of 14 millions.

Q. You say you want grants from Government. In what way do you want grants?—
A. Loans at favourable rates of interest.

Q. Should Government guarantee interest on the capital?—A. Yes.

Q. You say that some of the Native States have liberally helped private enterprises. Can you cite an example?—A. I know the Mysore Government have helped the starting of a spinning company. They have purchased a few lakhs worth of shares and gave suitable land and in course of time these shares are sold to the public when the company was profitably working.

Q. You say that an industrial concern before it seeks Government aid should show its *bond fides* by its good management. Suppose a new concern is being started, how can they show their *bond fides*?—A. Take for example the great hydro-electric scheme. The bare name of the eminent directors would bring in any amount of capital.

Q. Do you think that in the beginning also Government should help?—A. In special cases, but one ought to be very careful.

Q. Then about the match factory you say that the other man will be able to give information?—A. Yes.

Q. You say that Government control over industries is best exercised by having an audit and periodical inspection. Suppose you had an auditor, do you think that is a proper control of Government? Don't you think that the Government should have their own directors?—
A. It may lead to friction.

Q. What friction can there be? He can only guard the interests of Government?—A. I agree with you there.

Q. You say whenever a pioneer industry is started and there is offer of purchase by a private individual, Government should part with it, and you say that preference should be given to companies. What companies do you refer to?—A. Something like the Aluminium works in Madras.

Q. You do not want private individuals?—A. It would be better if they were joint stock companies. An authorised syndicate should be formed. In the Bengal Chemical Company I have always been anxious to see that no man purchases a very large number of shares.

Q. You say that industrial schools should be under the joint control of the Education Department and the Director of Industries? Do you think that would work smoothly?—
A. It would then be able to command knowledge of a two-fold character. Of course dual control is to be avoided. The spheres of the control of the two departments should be clearly defined.

Q. You say that you are in favour of Government official journals and that they should be supplied gratis. Do you know what it will cost?—A. I mean at a nominal cost.

Q. You say that dockyards might be established. For building what?—A. Battleships.

Q. We want steel plates for it and we are not producing them at present?—A. In the meantime we have to import. I read a good deal about it in the case of Japan. If we were to wait for ourselves making the steel plates we shall have to wait indefinitely. In the case of Japan it cost her very much to build her own battleships. Recent events have confirmed and justified the wisdom of Japan.

Q. You say that if any industry is profitable, capital would be readily forthcoming. You know for example how successfully the jute mills are working. Why do not the Bengal capitalists put in their money?—A. I think that they are now opening their eyes to the matter.

Q. Do you think they will come out?—A. I know there is a middle class who are anxious to invest their money in the Bengal Chemical Works. They are small capitalists.

Q. Do you think that the permanent settlement is hampering industries?—A. I alluded to that as one of the economic reasons, as affording a sure source of investment.

Q. There is an association which is sending students to Japan and other countries. Do these men get employment on their return?—A. I suppose Mr. Jogindra Chandra Ghosh might be able to give you better information. I heard that they are getting some employment or other.

Hon'ble Sir R. N. Mookerjee.—Q. In the last sentence of paragraph 5 you say "It is desirable that Government should exercise some supervision for some years after purchase." Do you think that it will encourage anybody to come and purchase. When I purchase why should Government continue to supervise?—A. I meant until the money was all paid off.

Q. You clearly say that Government should continue the control after purchase for some years?—A. I meant only that it should be until the money has been paid off. After that nobody would like Government interference.

Q. If your suggestion that the Secretary of State should force firms to take apprentices is adopted, do you not think that indirectly we will have to pay for it?—A. When you order several millions of worth material the firm would readily oblige you.

Q. Would they not increase their rate?—A. There is so much competition as regards the supply of goods that they will not dare to do that.

Q. How many apprentices do you take in your own works?—A. We do not take any, we have many secrets in the chemical industry.

Q. In the same way the other firms will have their own secrets also?—A. The chemists' secrets are somewhat different from the ordinary secrets; if, however, Government were to guarantee the placing in of large orders for a number of years, I would gladly advise the taking in of a limited number of apprentices.

Q. You said that in your chemical industries you do not allow anybody to buy more than a few shares. Are the shares quoted in the market?—A. It has not been necessary to have them quoted in the market.

Dr. E. Hopkins.—Q. You stated that the Japanese Government made it a condition that contracting firms should take Japanese apprentices. Do you think that the Japanese Government could make a similar condition to-day?—A. My point is that if you make large purchases from a firm they would always be ready to accommodate you.

Q. I ask you with reference to the particular instance of Japan. Do you think they could make such a condition to-day?—A. Possibly not.

Q. You think the Government of India would have no difficulty in making such a stipulation?—A. The Japanese Government is a foreign Government and when they got such terms my point is that we should be able to get better terms.

Q. Of what University are you a doctor?—A. Edinburgh, Calcutta and Durham Universities.

Q. For research work?—A. Yes.

Q. You have good opportunity of judging of the capacity of University students in connection with your chemical and pharmaceutical works?—A. Yes.

Q. You made a rather startling statement that 99 per cent of the M. Sc. students of the Calcutta University were too bookish to be of any value for ordinary business avocations?—A. They are good for research work but they are no good for business and commercial work.

Q. What do you attribute that to?—A. In Bengal there has been a kind of hereditary repugnance to taking to trade and commerce. We have always been notorious for choosing the clerical line, the law and the professions.

Q. And then in the course of your evidence you press the point that there should be manual training in the secondary schools. No doubt if it became universal it would go a long way towards correcting the tendency that you suggest. Would you not carry that manual training back to primary education?—A. Yes. That would be the best possible way.

Q. So that you would insist on manual training at the same time that the boy learns to read and write?—A. I should very much like it.

Q. Have you worked out a scheme?—A. At first in the kindergarten system they would make gardens and learn the use of the spade. Then they will learn basket making, etc.

Q. So you would devote some of the time now given to reading and writing to manual work?—A. Yes.

Q. And you think that it is quite feasible?—A. Yes, especially in the villages in Bengal.

Q. Then I suppose when they have advanced to secondary education manual training might take a somewhat higher form, e.g., carpentry, directly in connection with some industry?—A. Yes.

Q. The two things might then go on together?—A. Yes.

Q. Can you tell us exactly what the B standard is?—A. At present what is meant by technical schools in the places outside Calcutta means no more than securing the services of a carpenter and a blacksmith. That is the only help they get and they are spoken of as technical schools. That is not what is wanted. The B standard will give an industrial bent to education, I mean to general education.

Q. If primary education is associated with manual training that could be carried to the secondary school and up to the time when a student goes to the University and this would more than anything else correct the present state of things which you deplore?—A. Yes.

Mr. A. Chatterton.—Q. Are the methods that you advocate in your written evidence those which you have pursued in so far as it was possible in developing a very successful chemical industry?—A. Yes.

Q. You did not apply for any Government assistance?—A. Never.

Q. You have had no financial aid of any kind from Government?—A. We never asked for it.

Q. You began on a small scale and gradually built up?—A. We proceeded step by step.

Q. Don't you think that other people also could do the same sort of thing when they wish to start an industry?—A. It has taken us nearly a quarter of a century to make this progress. Therefore it is very necessary to start with a very big capital and secure the best possible experts if we are to compete with foreign markets.

Q. How many chemists have you got in your factory?—A. Four chemists in the higher

Q. How many altogether?—A. There are a number of people who make preparations like compounders and foremen. Four are M. St.s of the Calcutta University. My services also are at their disposal.

Q. Have you got any experience of students who have returned from Europe or America who were sent there by Government as technical scholars?—A. Yes.

Q. Do you think that it is a satisfactory system?—A. I have suggested that those who have already been in business and have done some kind of work at home could be selected to go to Europe and learn the advanced methods. At present they are sending men indiscriminately.

Q. Have you visited the Indian Institute of Science in Bangalore?—A. I have recently been to Bangalore. I am a visitor appointed by the Calcutta University.

Q. You say there is no proper controlling authority. With reference to what?—A. I have found that up till now 39 lakhs of rupees have been spent.

Q. Is that accurate?—A. That is what I saw in the papers and the central block cost 6 to 7 lakhs of rupees. Even the Director or the professoriate could not tell me what it is meant for. Seven lakhs for a block which is scarcely wanted and for which nobody would like to be held responsible! The money has been recklessly spent.

Q. Whom did you get this information from?—A. The Director and the professoriate. They could not give me any satisfactory information. There is a big clock tower in the central building which is meant to locate the library. There are some halls as big as those in the Buckingham Palace.

Q. All this information that you have got is not strictly accurate. That is why I should like you to modify your statement to some extent?—A. That was the universal complaint that I heard from the people of Madras and Bombay.

Q. When you want to make a statement of this kind why did you not go to the Director and get the information?—A. I have seen it published in the public papers. I got reports that up till now 39 lakhs of rupees have been spent in block and building and also in current expenses.

Q. You are mixing up two very different things. It is 21 lakhs. Would you not therefore withdraw that sentence. Whatever mistakes there may have been in the past things are on a better basis now and presumably there is some controlling authority at the present moment?—A. I am strongly of opinion that the constitution of the committee ought to be changed. Because the outside public have no voice in the matter. The professoriate and the Director are in the overwhelming majority and they can carry on things in their own way and I believe even the donors have no hand in the matter.

Q. You object to the location of the Institute of Science in Bangalore. Have you got any accurate knowledge of the amount of industrial work going on in the neighbourhood of Bangalore?—A. I have seen the harnessing of the Cauvery and the Kolar Gold fields. That represents a huge industrial enterprise. There are weaving, spinning and woollen mills.

Q. Do you still adhere to your opinion that it is an unsatisfactory place in which to locate an industrial research institute?—A. I mean it is so far away.

Q. It is of course a long way from Bengal but is it far away from the centres of industry in the south of India?—A. It is nearer Madras. I fully admit. Possibly it is of great advantage to the Government of Mysore.

Q. Your complaint then is this that the Institute has not been of much use to Bengal. It may be of use to the south of India?—A. I do not know whether it has been of much use to Bombay, which claims some of the biggest donors.

Q. From this I understand that you would recommend the creation of a number of similar institutes in other parts of India, in the large industrial centres?—A. It all depends, as I said. We are yet in the premature stages to pass any decided opinion. I have said nothing against the personnel of the Institute.

Q. I am not now talking of the Indian Institute of Science and your opinion of it. I am asking you whether you are in favour of having similar institutes in Calcutta worked on proper lines.—A. We have got centres of research in Calcutta and do not think a separate institute would be of much use. In the Presidency College and the University College of Science we have got researches going on.

Q. Then you have got researches sufficiently developed?—A. So far as chemistry is concerned, we have got ample facilities.

Q. Are these researches in Calcutta devoted to the prosecution of what I may call pure science or the application of science?—A. It is for pure science.

Q. Has any research work been done in connection with the application of science?—A. Not at all.

Q. Do you want any help provided for Calcutta?—A. It would be useful for local institutions. If one wants to have some information connected with any industry in Bengal it would be inconvenient to go to Bangalore. Moreover they would be overwhelmed with work from the various provinces of India, each province sending in its own peculiarities.

Q. Would you be in favour of the development of central research laboratories for the prosecution of these enquiries in India or do you want to have them locally?—A. I should like

to have local centres. Because it is the particular locality that would determine the conditions of work in that locality. *Mr. S. Deb.*

Q. Do you want to have these scientific centres under provincial or Imperial control?—*A.* I should have provincial control.

Mr. C. E. Low.—Q. Do you propose to have one in each of the provinces or in each of the major provinces?—*A.* One for each of the provinces, one for Bengal, one for the United Provinces, one for the Madras and so on.

Q. You do not propose to have one for Delhi?—*A.* No. The smaller provinces could apply for help to the major provinces.

Q. You would allow the smaller provinces to have access to the larger provinces?—*A.* Yes.

Q. Have you anything to add to the remarks you have made?—*A.* We have been very unfortunate in the selection of our industries. And before any new industry is started it should be impressed upon the would-be organisers that they should take sufficient precautions to enquire as to the supply of raw materials and the scope of the sale of the articles and so on. In this connection to which I have referred, the organisers might as well have enquired where they were likely to get their wood. Many industries have been taken up, for instance, soap making. I find that the very important thing necessary, namely soda, has to be imported and then there is the glycerine which is a bye-product. In European countries it is the glycerine which keeps up the soap industry. We throw it away. Unless we start on a big scale we cannot recover the glycerine. It requires a big plant. At present to throw away the glycerine and to make the soap would be an impossible undertaking. The few industries that are surviving are able to keep on because patriotism pays a kind of bounty as it were.

WITNESS No. 83.

MR. S. DEB, *Manager, Calcutta Pottery Works, Calcutta.*

WRITTEN EVIDENCE.

In my opinion, there is no dearth of capital in Bengal; but the people generally invest their money in land which they think the best and the safest investment. Now-a-days the money-lending business, under proper security, is drawing and engaging a large amount of capital in Bengal. I cannot say that the money cannot be found to finance industries. The tea industry for example never lacks capital, because the industry is considered safe, and the profit accrued therefrom is very tempting. The first tea concern was started in 1840, and in the course of less than 45 years area under tea rose about a million bighas. From 1885—1913 it has doubled its area and the aggregate paid up capital of 98 companies, registered in India, amounts to 3 crores of rupees and the gardens employing more than 100,000 persons.

Thus when faith has once been created in an industry as to its safety and prospects, capital is never lacking. Over capitalization has frequently happened in many cases. To cite the example of the oil mill industry of Calcutta; seeing the prospects of the first few oil mills, turning out edible oils mainly, nearly 80 mills with a total invested capital of Rs. 1,20,00,000 approximately, have cropped up in an area of about four square miles within the last 20 years. Now the total output of edible oils, if all the mills are fully worked, is far more than the local consumption, hence the mills are obliged to shorten their hours of work.

Faith in the promoters had led to the establishment of various other industries also. The name of Messrs. Tata & Sons has led to the foundation of the Iron and Steel Works at Sakchi. The Hydro-Electric Works initiated by the said company have proved successful and also the cotton mills they have promoted.

In Calcutta, capital was never lacking for the various railway companies which have been started, since they have been promoted by companies, who command a good deal of public faith.

The faith, which is an essential factor in the industrial development of Bengal, is badly wanting now-a-days, so far as the promotion of joint-stock companies by the people are concerned. *Causes of failure of joint-stock enterprises in Bengal.*

I entirely agree with Mr. Swan, when he says in his report, that the causes of failure of joint-stock enterprises in Bengal are principally due to—

- (1) insufficient capital and
- (2) inefficient management,

but the question is deeper than that, for whenever any successful industry has been founded on a large scale in any civilized country, involving large capital and on a sound basis, there must have been a large amount of forethought.

The promoters of a company have to be really efficient men who know their business and they must go through every question of detail, not only in the process of manufacture, but in the selection and choice of raw materials, the market where they are purchased, the competition which it has to confront, the advantages and disadvantages of the proposed company

over its competitors in the disposal of their products and several other questions, before an industry is started. If these are properly investigated and the promoters are really satisfied that such an industry should be established since it has got its advantages over its rivals, the question of deficiency of capital cannot be raised at all.

The directors and promoters of so-called industries here have been all more or less professional men, who may have great abilities and eminence in their own profession, but they had neither the opportunity nor the inclination of gaining experience in business methods and finance. With the cares and anxieties of their own profession they naturally cannot consider this new adoption of theirs as anything very serious and the result is inevitable failure. The management and directorship of industrial concerns require years of training and whole-hearted concentration, but these directors considered that the attendance of a few hours snatched from their professions is enough to run an industrial concern successfully. Before the Tata Iron and Steel Works at Sakchi have been actually started, years were spent in preliminary enquiries. The industrial activity of recent years is in my opinion not a proper and healthy attempt at industrial development, but it serves as a great experience, which has always been the case in the early stages of industrial development all over the world. When this effervescence subsides, the true state of affairs will be perceived and right methods will be adopted.

The only way to start and develop industries seems to be by private enterprise. But such enterprises are very few and limited. No industrial development of a country is possible in that way. Very few have got that spirit of enterprise and purse to initiate new industries and sustain them till they are profitable and finance them for adequate expansion so as to compete favourably with foreign rivals who, employing larger capital and with more business facilities and taking advantage of the open-door policy of India, can dump their goods in India and stifle the infant industry. For example, I may mention the industry in which I am engaged. It was a trial, both for the capitalists and for the expert. The capitalists had to wait very long nearly for fifteen years, without any sign of profit, and the expert, for years together, had to put forth every possible exertion to save the infant industry from destruction by foreign competition. There are few to court such troubles and anxieties at his own cost. A few industries that have been initiated by private enterprise, have shown signs of success. I may mention chiefly among them the Calcutta Pottery Works, the National Tannery of Dr. N. R. Sarkar and the Bengal Galvanizing Works of Messrs. P. N. Dutt & Co.

The funds and capabilities of private enterprises are limited. India is mainly exporting to other foreign countries her produce to the extent of nearly £100,000,000 annually. If she has got to make her own manufactures, she has got to stand in competition with factory people with huge capital and organisation, and nothing short of a joint-stock concern, commanding big capital, can accomplish this. To give the first start, to investigate properly the various conditions, to create faith in the people regarding the successful working of an industry, Government must take the initiative. As it has done the pioneering business in some industries, it ought to come forward for others also. To cite an example, I refer to Sir George Watt's book—'The Commercial Products of India'—in which he writes, "It is not known how much money the Government of India actually spent from first to last in their efforts to ingraft the tea industry of India, but it would appear that Gordon's mission to China and the expenditure of the Indian Tea Commission came to close on £18,000. If we assume that sum to have represented but one quarter of the total expenditure actually incurred, the result might still in perfect fairness be characterised as one of the most profitable undertakings of the administration of the Empire of India." Japan did the very same thing as we find in Count Okuma's book—'Fifty Years of New Japan,' where it is stated that "The Imperial Government took every step necessary for the encouragement of new industries. Model factories were established at considerable expense, samples were brought from foreign countries to serve as samples for Japanese industries, and were also loaned, on application, to the prefectural governments. A meeting of manufacturers was held in order to ventilate the opinions of persons engaged in industry, and regulation for trade associations were issued with the object of harmonising industrial pursuits and promoting their interests. The system of credit mobilier was inaugurated for the benefit of new enterprises, and spinning mills established by the Government in Aichi and Hiroshima prefectures, were subsequently sold to the public in order to encourage the development of that industry. The Government induced prefectures to organize local industrial joint exhibitions from time to time, expert judges being commissioned by the central Government in order to encourage material development. Such measures had the effect of rapidly promoting industries which had been inaugurated in the early years of Meiji." The first stage of the development should be done by Government till it is assured that industry is feasible here profitably, then it can hand over to concerns who would evidently be eager to undertake it. Departmental monographs, quite interesting in their own way, are only of value to the man who is actually in the industry; they can never create eagerness in others to start an industry. Hence it is, that all Government monographs are a sealed book to 99 per cent. of the reading public. If a dozen industries under Government auspices prove to be successful, confidence will be created in the minds of the people who will get an opportunity of seeing what capital and organisation mean in the success of an industry. Honest and sound promoters will come forward to start industries with limited liability and good investors will not be wanting to finance the enterprises.

I suggest that the best ways by which the Government can help the development of industries are by :—

- (1) starting "pioneer factories" for new industries,
- (2) helping existing industries,
- (3) establishing a Central Technological Institute with a commercial museum attached to it in Bengal,

where the best brains of the land might be employed to solve not questions of academic interests but questions actually to be solved in industries.

I would suggest the establishment of a 'pioneer factory' for glass manufacture in the Pioneer factory beginning.

The total value of glass and glassware imported into India in the year ending 31st March 1914 was £1,296,853 and the figures show that imports under this head have increased steadily in recent years.

Few glass factories started with in recent years have had successful results. The unsuitability of the soil and its inhabitants and various other causes have been attributed to their failure. But in my opinion no thorough investigation in this matter has been gone into as it ought to be considering the magnitude of the industry. The various countries producing glass, the nature and quality of materials they use, the most up-to-date methods they employ, the capital they invest, the outturn they secure, the market they command, the intermediary through which these markets are secured, their competitors and the advantages and disadvantages of each class of goods, are matters to be carefully gone into. We should investigate thoroughly the conditions how, within the short space of four years, Japan could send to the Indian market from Rs. 8 lakhs to 25 lakhs worth of glass articles; wherein lay her speciality, what has made her so efficient as a manufacturer of glass, are matters requiring serious attention before any attempt is made to start any glass works here. The United States of America undertook to manufacture glass in the early nineties, and it is now a success. There must be many lessons to be learnt from these preliminary investigations which would save much time, energy and money. In the circumstances I would suggest that the Government, before it starts the pioneer industry, should send a competent person to the various glass manufacturing centres of the world, with special attention to those countries where the industry has been recently successfully started. Fortified with this information and all the data necessary for the purpose and applying conditions suitable to the country the factory would be just the sort of a model required.

Regarding the second suggestion of helping existing industries the following methods of Government giving Government aid are in my opinion practicable :—

- (1) guaranteed dividends for a limited period, with or without subsequent refund to Government of the expenditure incurred in paying dividends at the guaranteed rate,
- (2) loans, with or without interest,
- (3) supply of machinery and plant on the hire purchase system—generally for the development of home or cottage industries,
- (4) guaranteed Government purchase of products for limited periods,

and the selection of any method (one or more at a time if necessary) will depend on the nature of the industry to be helped. But in all cases the industries should have banking facilities so that they may get money from the bank at small rates of interest with proper security.

I think it is proper and necessary for the Government to keep a control over the industries which they will help. The best control will be to keep a Government director, as in the case of guaranteed railways on the board if the industry is a joint-stock company; if it is a private enterprise regular inspection by suitable Government officers and auditing of accounts by Government auditors, as in the case of co-operative credit societies, will be necessary.

Some industries exist in Bengal and a fair amount of work has already been done towards their development. I recommend Government aid to such industries.

The industries which I know and should be helped are as follows:—1. Tanning industry. 2. Chemical industry. 3. Match industry. 4. Porcelain and earthenware. 5. Pencil-making industry.

As the success of these industries is practically assured and a great deal of uphill work has already been done by private enterprise, the Government can very easily understand their positions if proper investigations are made.

My third suggestion is the establishment of a Central Technological Institute with a commercial museum attached to it in Bengal. These institutions, established in different parts of the country, have been the main factor in developing the industries of Japan. I have had the good fortune of working in one of these institutions during my stay in Japan in 1904 and 1909 and I write this from my own experience. The functions of these institutions are vast and varied and they may be classified as follows :—

1. To gather information of the available resources of the country—agricultural, forest, mineral, etc.—suited for industrial development. They should be arranged and classified

properly to suit various industries in which they may be utilized and thus forming the nucleus of an economic products museum.

2. To carry out exhaustive researches on raw materials available in the country with a view to manufacture finished products as imported in the country and place results of such researches at the disposal of the public.

3. To find out by experiment if it is possible to manufacture a certain article imported in large quantities in this country, out of raw materials available here.

On this subject I have got practical experience at the Porcelain Testing Laboratory at Kyoto (Japan) which would be of interest to the Commission. There exists a class of earthenware in England called the "Ironstone China" chiefly manufactured by Messrs. Johnson Bros., Ltd., of Hanley. The import of "Ironstone China" plates and dishes rose very considerably in Japan in 1905, in spite of heavy freights and a high tariff and within a short time they replaced Japan-made porcelain plates and dishes in the hotels and restaurants. The Government took up the matter and reported the fact to the Director of the Laboratory. Experiments in manufacturing "Ironstone China" out of Japanese raw materials began in earnest. We were given dozens of 'Ironstone China' plates to break and scrape the thin layer of glaze on them; compositions of 'Ironstone China' body and glaze were found out by analysis, suitable indigenous raw materials were selected and "Ironstone China" was manufactured in the laboratory. I remember a pottery manufacturer in Nagoya, named Matsumura, who took up this new line. When I revisited Japan in 1909 the factory was in a very prosperous condition and I could not find Johnson Bros.' "Ironstone China" any more there. Now the "Nippon Koshitsu Toki Kaisha" (Japan Ironstone China Manufacturing Co.) working at Kanazawa with a capital of more than 15 lakhs of rupees, is turning out huge quantities of Ironstone China of different kinds. The Calcutta market is flooded with their manufactures and their quality can be best judged from the samples I have supplied to the commercial museum as exhibits.

4. To issue regular reports of the results of all researches carried out in the Institute and to publish monthly a journal dealing with topics of industrial interest and containing reports of researches in other provinces of India or abroad. I would suggest the publication of a vernacular edition of this journal

5. To allow competent persons interested in any industry to investigate and carry on special researches on their own lines in the laboratories of the Institute and to use the machineries of the workshop for his purpose. The scope of his researches should be enquired into at the beginning and if found practicable he would be admitted free or on payment of a fee. I have had experience of such a laboratory in Berlin (Chemisches Laboratorium für Tonindustrie. Prof. Dr. H. Seger & E. Cramer G. m. b. H) where I carried out special researches on the manufacture of electrical and chemical porcelain with raw materials which I took from here. I had to pay a fee of Mk. 250 a month.

6. To help manufacturers in solving their technical difficulties and also to help intending manufacturers by selecting suitable raw materials, machinery, etc., or by rendering any special assistance that they may require.

7. To hold regular exhibitions of products manufactured in the laboratory along with the issuing of reports and to invite persons or manufacturers interested in them and to display side by side the samples of similar imported articles together with statistics showing the quantity imported and prices and also pointing out the difference in quality if there be any, which might be in the way of introducing similar locally manufactured stuff into the market.

8. To hold periodic lectures on industrial subjects, with experiments, lantern slides, etc., by inviting experts from different parts of India or abroad if possible. In the École Polytechnic at Paris where periodic lectures on different subjects are conducted with the help of the best experts available in France who are actually engaged in industries as directors and managers and illustrate their statements by suitable models, appliances, to people interested on the subject specially invited for the purpose.

9. To have a department for the rapid commercial analysis of various industrial stuffs, not only the raw materials but also the finished products on payment of suitable fees. For example, if a sample of Kaolin is sent for analysis and found on examination suitable for the manufacture of high grade porcelain, the department might be asked to manufacture a set of articles out of that material on the presentation of a fee. The same practice prevails in the Industrial Testing Laboratory at Tokyo (Japan) and in the Tonindustrie Laboratory at Berlin. This has given very great impetus to the manufacture of various articles in these countries.

10. To have a testing department where articles for human consumption, medicines and drugs, instruments of precision, weights and measures, will get their certificates of guarantee without which they will not be allowed to be issued to the public.

11. To have an information bureau which will organise the connection between the prospecting buyer and seller and supply information to the public on matters industrial.

The Central Technological Institute with commercial museum attached to it should be situated close at hand to the centre of several industries. In my opinion the Technological Institute should be established in Calcutta with a department specially devoted to the various industries which might be developed in Bengal. Calcutta being the first port in India, there is facility in securing raw materials and the disposal of finished products;

there is proximity of coal, waterways, railways, and a large area surrounding it capable of being utilised as centres of industries. The Indian Institute of Science at Bangalore, though situated in an admirable climate having excellent surroundings, is so far away from industrial centres that no concern actually engaged in industries gets the benefit from its departments which is secured by means of frequent contact. The man in the industry would like to get his problems solved and his difficulties removed within the least time possible and he cannot afford the trouble and delay inevitable in communicating from a distance. So researches in the Indian Institute of Science at Bangalore or in the Imperial Institute at London, as far as I know, have so far been incapable of arousing any interest in the Indian manufacturers.

The Institute should consist of an up-to-date analytical laboratory, a testing department where all manufactured products can be tested such as cement, paper, textiles, sugar, medicines, drugs, etc., a workshop well fitted with all modern tools and appliances, a foundry capable of turning out special instruments and supply all the needs of the testing department and the laboratory, so that the whole thing might be self-contained. A well equipped library containing scientific and technical books in all the principal languages of Europe and periodicals dealing with scientific and technical matters, where the workers will get every facility to get up-to-date information. There should be kept a portfolio showing plans and designs of the best industrial establishments of the world and the designs of the most up-to-date machineries employed in industries together with catalogues of firms manufacturing and dealing with them. In this connection I am of opinion that the Patent, Trade Mark and Designs Department might be profitably incorporated with the Institute.

The Institute should consist of a director. I don't think it is necessary to call him Director of Industries or by any such name. Big names here are often misleading and unapproachable to the public. A person with a liberal scientific education, practical and businesslike, with power to organise and control, familiar with the country and the people, social and sympathetic, with a knowledge of French and German languages if possible is most suited for the position. I have no objection to whatever nationality he might belong to. If these qualities are difficult to find in one man a directorate may be formed of persons as is usually found in Germany, each having one or more of the necessary qualifications. There will be two assistants under the Director—one a highly trained scientist in direct charge of the laboratory and workshops and the other a practical business man with thorough general and commercial education in charge of the commercial museum. In my opinion the above two positions should be held by Bengalees who might be suitably trained for the purpose here or preferably in foreign countries.

The Board of Control of the Institute and the commercial museum should consist of—

- 3 representatives of Government,
- 3 business men,
- 3 directors or managers of manufacturing concerns,
- 3 scientists and

the director and assistant directors of the Institute as *ex-officio* members. The assistant director in charge of the commercial museum will act as Secretary to the Board of Control.

The working of the commercial museum may be viewed in two aspects. The first aspect is that of assistance in marketing products by bringing in contact the manufacturer and the dealer. The second aspect has been practically lost sight of, *viz.* :—that of exhibiting those finished products which find their entrance into the country as imports made out of the raw materials which are exported from here or out of similar materials that can be had here in quantities. The finished articles should be exhibited; the name of firms with their invested capitals in these industries, and the output, should accompany the exhibits. It is not possible that the Government should undertake to exhibit all the imported articles at once but can make a good beginning by selecting a few important ones. The undertaking is really of a very big nature but I think it will be a move in the right direction to arouse interest of the people in industries. I have seen a similar museum being organised in such centres of industry as Osaka in Japan.

Side by side with these things ought to be exhibited the locally made articles, if there be any, with a note from the Director as to the result of its tests, the advantages and disadvantages of each and the profitable method of overcoming any defect in the local made product. For example, scissors which are manufactured locally are being replaced here on the market by cheap cast steel American scissors which are brittle and hence less durable but they are of superior finish and the nickel plating which prevents rusting appeals to the purchaser. I may mention in this connection the Deutsches Museum at Munich, though not purely commercial, where the exhibits greatly appealed to my mind as to how to encourage the knowledge and taste of science and industry in the minds of young and old alike.

India abounds in all sorts of raw materials suitable for industrial development. Apart from what have already come to our knowledge, enormous quantities of hidden treasures are lying undiscovered and vast tracts of the country unexplored. It will take years of labour and patient investigations to ascertain fully the extent of her productive capacity.

The present day manufacturer has to face enormous difficulties in finding out and selecting the raw materials he wishes to have. In Europe organised trades exist to supply raw materials to industrial concerns. If I want to have a pure Kaolin having 45.6 per cent.

Silica and 38.5 per cent. of Alumina. I am here to state the great difficulty of procuring and saving of trouble to the manufacturer. When the Calcutta Pottery Works were established in 1907, China clay was forthcoming from the hills at Rajmahal. I wanted to manufacture porcelain but I had no feldspar. I was at a loss to know what to do. The records of Geological Survey of India could not help me materially. They could not tell me as to the possible source of a constant and economic supply of pure feldspar and so I am obliged to set out accompanied by a geologist on a feldspar-finding expedition. After a fortnight's very hard work to which I was quite unused we were fortunate enough to find a good deposit of feldspar suitable for the manufacture of high class porcelain.

I have no intention of disturbing the present method and scope of enquiry of the Geological Survey of India but in my opinion the Geological Department ought to supply to the proposed Technological Institute any mineral of economic interest and get the report of the Institute as regards the industrial utility of the thing and then proceed to detailed investigation if necessary. The Technological Institute as it is constituted will communicate with the actual consumers and base their observation on actual facts. The above method is to be applied to all departmental investigations of the Government such as forest, agriculture, etc.

After proper raw materials are secured the question of transmission comes forward. Here tariff rates of railway companies are a perplexity to the industrialist. My small experience suggest some examples. Porcelain, earthenware crockery and toys though made out of practically the same materials and having the same value (commercial porcelain fetches no better value than earthenware and crockery) weight for weight have four different rates of tariff. There are special rates for China clays imported from abroad to be used in industries established in different parts of India, where it is not however the principal ingredient, whereas in our case we are handicapped by heavy railway freight on this principal raw material of ours even in spite of our representations. The steamer freight of China clay from Europe to Calcutta is insignificantly small compared to the railway freights here. The marked capacity of waggons is another mystery to us. A waggon marked 16 tons holds wood owing to its low density nine tons only but the consignee has to pay all the same for 16 tons, apart from the question of rate. Further I find in the railway tariff that sand used for plastering purposes has got to pay rates higher than chemicals such as Epsom salt, while the value of one is thirty times as much as the other.

I claim to be no authority on matters dealing with railway tariff, but in my opinion, if any new industry is organised here, the railway companies should allow concession rates both as regards the carriage of raw materials and finished products to different distributing centres in India, then and then only the industry can develop and successfully compete with its foreign rival in the open market. I am sorry to state that owing to this cause the inter-provincial trade of the Calcutta Pottery Works could not be properly developed. Government should make some such arrangement so that this can be effected.

The question of securing expert knowledge in India is beset with many difficulties as everywhere else where it is intended to start new industries. I think it is not always safe and wise to put Indians, whether trained in foreign countries or locally but wanting in proper experience, in direct charge of starting a new industry. There may be exceptions to this rule such as the managers of the cotton mills of the Bombay Presidency who are mostly Indians. They have gained their experience after years of apprenticeship, they have begun their life at the bottom of the ladder and have risen to prominence by sheer dint of honest and attentive work under able masters. This is how would-be managers of industrial concerns should receive their training—a slow but sure education.

In Europe the managers of industrial concerns are men who have high educational qualifications before they serve as apprentices in industrial establishments and go through all stages of training in it before they get to the position of a manager.

When the position of expert knowledge is such, it is more safe and wise to get experts from foreign countries in the beginning as Japan did early in the Meiji era for developing most of her principal industries. What struck me most there is the employment of a German expert for organising her porcelain industry on modern lines—an industry which Japan may call her own and existing in the country for the last 600 years. Japan felt that her primitive ways, though perfected in their own lines, were unable to compete with its rivals in the markets of the world, unless she would take the help of the latest scientific methods and ideas.

As the appointment of a first rate able foreign director is essential in organising a new industry it is also essential that he should be appointed only for a limited period during which his Indian assistants, also of foreign training, are intelligent enough to take the sole responsibility in his presence, of the concern. The reason is this, because, a really first class expert is expensive, he is expected to charge much more than he gets at home and later on he may not be satisfied on the cost of the products when the output goes into the open market. The expenses that will be incurred in retaining his services will be considered as a loss and not as an investment in the profit and loss account. I would suggest that the Government should take the responsibility of appointing such a director and should not leave it to the private industry. The director should be a man of high character and high ability and should be a native of the country where the industry is to be established. He should be a man of high character and high ability and should be a native of the country where the industry is to be established.

Now the question comes of men who would help these Indian directors and to take their place afterwards. Where would the factory people look for these men? In these days of specialisation, it is almost impossible that skilled labour starting from the lowest position can attain the post of a director at any time. For this purpose polytechnics are necessary. We cannot always afford to send people to foreign countries for technical education as this is costly and beset with many difficulties. It is only the directors who might take a trip to the various centres of industries in which they are interested in foreign countries in order to assimilate the growing changes in their line. It is sometimes urged that the polytechnics should come after the industries but in my opinion they should come before them,—as has been the case in Germany and Japan where the growth of the polytechnics really gave an impetus to the establishment of various industries. Considering the present state of industries in Bengal I would suggest the establishment of a higher polytechnic in Calcutta having a limited course of subjects at the beginning which might be extended later. I expect that this higher polytechnic in Calcutta would, if properly organised and managed, do the same thing for Bengal or for the whole of India as the great Charlottenburg polytechnic did and is doing for the industries of Germany.

Our experts after their training in foreign countries when they come over here have to face many difficulties. Since they cannot secure the experience much needed within the limited period of their stay in foreign countries, they cannot judge at the outset the time that would be required to successfully run a factory. The enthusiastic capitalist gets tired with this delay and in many cases he attributes all the delay and trouble to the technical inability of the expert. The capitalists here generally start industries without proper investigation and knowledge and after it has been handed over to the expert they shake off all responsibility and hardly think it necessary to co-operate with him. What could have been achieved under proper guidance and co-operation in 5 years is done under great difficulties in a decade. This is really the history of many sad failures.

There is another thing yet to be noted. The set of men so far chosen as properly qualified to be the future directors of our new industries and sent to foreign countries to secure experience were in my opinion in many cases not very happily selected. It attracted in many cases youths who finding no bright prospect before them in this country with their education and attainments, fell in with this idea of proceeding to foreign lands at public expense. It is very sad that these people had seldom the inclination, attainments, aptitude and other necessary qualities which are required in heads of concerns manipulating men and money.

The Indian artisans are unused to the life of organised big industries which are coming to this land. When we consider that such a small percentage of the people is educated, their ideas of living and concerted action so narrow and limited, the social system, easy-going life, small ideas of comfort, all go together to retard the growth of skilled labour here for organised industries. In my works I could not depend on potters simply but had to deal with all classes of people, representing all shades of castes. There were very great difficulties, no doubt, at the beginning to bring them down to one common level and to make them efficient workers. I have invariably seen that labourers having little education turning out more efficient within a short time than others without it. To my experience little sympathy, fellow-feeling and setting higher ideals of life before them and identifying their interest with the interest of the concern in which they are engaged invariably creates in them a sense of the dignity of labour. In industrial organisations where men are considered as so many units to transform one article into another at a definite cost, these factors are entirely lost sight of and naturally no sense of responsibility can grow in the workers and that is always the difficulty of a floating population near our mills. The mill hands can never identify themselves with the mill in which they are engaged for the time being.

In order to increase the efficiency of skilled labour and to create a taste for the work, I would suggest the establishment of an arts and crafts institution in Calcutta. This is most essential. Bombay felt the need and it has taken some shape there. The idea of night schools should be developed in the factories themselves more profitably.

When the proper article has been manufactured to the satisfaction of the market there is always the difficulty here, as the conditions now stand in marketing the product. In big organisations, it is not always possible to meet the retail dealers of its products neither is it a sound policy to do that and the manufacturer has got to work through an intermediary who knows the market well, having good credit and connection with the bank and can secure liquid money on credit for raw materials. For these therefore I would suggest the formation of a co-operative credit bank guaranteed by the Government and financed by the people which will finance industries on easy terms of interest for the purchase of raw materials, machineries for extension, stocking of finished products, etc. It will have branches in all industrial and trading localities, giving facilities for the purchase of raw materials as well as the sale of finished products. I felt this need many a time in my experience for the last few years. There is also another difficulty with which I am always confronted, namely, that of assistants with keen business instincts for looking after the commercial side of the industry. This is no less a difficulty than the securing of expert knowledge. Trade here, as was the case in Japan before the Restoration, has got associated with it not very elevated ideas in the minds of the people. A rich tradesman here will not command so much respect as a lawyer in the society. This has created a tendency of distaste of joining

any professional trade by our intelligent boys. Hence trade reports, trade journals are practically unused by the trades people which create great difficulties for organised industries to have a clear view of the market, and push business properly in right lines. Thus to elevate the ideas about commerce and to raise the position of the commercial people in the eyes of the public, I would suggest the establishment of a commercial college in Calcutta. The students from here will have proper ideas of finance and international trade, fluctuations of the market and many other business methods and knowledge and they will be the proper men who after training as an apprentice in an industry to be a successful business manager.

ORAL EVIDENCE, 28TH NOVEMBER 1916.

Mr. C. E. Low.—Q. Have you any knowledge of the extent to which Indian capital is invested in jute mills?—A. No.

Q. In tea?—A. Some of my friends are interested in tea. They have their own gardens.

Q. In coal mines?—A. One of our proprietors is interested. He is one of the biggest coal mine owners.

Q. Do the middle classes invest their money in coal shares?—A. Now they are doing.

Q. Is your company a limited company?—A. It is not a limited liability company. It is only a private concern.

Q. Have you a definite capital?—A. No.

Q. You obtained the capital of the concern from the partners?—A. Yes.

Q. Who were personally acquainted with each other?—A. Yes.

Q. How long has the concern been going on?—A. The new remodelled factory was started in 1907.

Q. What superior staff do you employ?—A. I have got two assistants. One is a graduate of the Bengal Technical Institute, and the other who was my accountant before now looks after the business side.

Q. Have they any particular technical qualifications?—A. The accountant has no technical qualifications, but my assistant was studying under me. I was a teacher in pottery in that Institute and he was under me for three years and he had practical training in my works.

Q. Have you any apprentices?—A. No. I have not got now.

Q. You make porcelain wares, especially electric insulators?—A. Yes.

Q. I understand you to say that you obtained certain trade connections through which to sell these, from the commercial museum?—A. Yes.

Q. You mean a provincial institute when you refer to a 'central technological institute'?—A. Yes, and not for India.

Q. You would prefer to see a number of provincial technological institutes?—A. Yes, if they are necessary for other provinces.

Q. You think that a skilled labourer starting from the lowest position cannot attain the post of a director at any time?—A. Now-a-days, it is so exacting and scientific, so far as my experience goes, that a skilled labourer cannot rise to the post of director in a highly technical industry like chemical industry.

Q. In your experience are students who have had technical training content to start at the bottom of the ladder or do they want to begin at once as managers?—A. For myself I am willing to start at the bottom of the ladder. Here we have no opening. When I came back from Japan and Germany I was placed in charge of a concern, and I am sorry for it. There was no help. I was obliged to accept the post of manager and the result has been that I have had to wait for ten years to build up this business and gain proper experience.

Q. My point was this. If you give students technical training in this country they do not realise that they have still to learn a great deal in the practical application of the theoretical knowledge, and they are not willing to begin lower down where they can learn that sort of thing by experience. They expect at once to get high posts, large pay and responsibility. You noticed that difficulty? How do you propose to overcome it?—A. They must get their admission as assistants in organised industries. There is no other help.

Q. Therefore you must have industries before you can give employment?—A. There are many students who have no employment whatsoever, sent by the Association for the Advancement of Scientific and Industrial Education. I was the first recipient of the scholarship from that Association.

Q. It is because there are no industries?—A. Because there is no industry here and no capital is forthcoming.

Hon'ble Pandit M. M. Malaviya.—Q. How many years did you spend in Germany and Japan?—A. One year in Germany and four years in Japan. I was in England for a month in Staffordshire.

Q. When you came out were you put in charge of these Pottery Works at once?—A. There was no Pottery Works then. Practically it was a small undertaking. I was put in charge of the concern and I developed it. From 1906 I have been in charge of it.

Q. You are of opinion that in the present state of the backwardness of Indians and of Indian industries, Government should give the first start?—A. Yes.

Q. And encourage industries by pioneering factories, where necessary, under proper conditions, and also by giving assistance financially in the way of guaranteeing dividends for a limited period?—A. Yes.

Q. With regard to the glass industry do you think that if the Government made the necessary investigations and published the results of those investigations, Indian capital would come forward to take up the business?—A. I think if proper investigations are made.

Q. If the Government publishes the information after investigation, it is possible in your opinion that without any Government guarantee the necessary capital may be subscribed?—A. Yes.

Q. But if the Government guaranteed dividends, then of course it will be subscribed without any doubt?—A. Yes.

Q. You have said in answer to a question by the Hon'ble Mr. Low, that you are in favour of one technological institute in each province?—A. Yes. So far as Bengal is concerned I want one.

Q. You think that the existence of the Institute of Science at Bangalore is not of much practical benefit to Bengal?—A. I think so. I have come in contact with various manufacturers and they have never expressed an opinion that they are getting any help from the Bangalore Institute or the Imperial Institute of London. It is my small experience.

Q. You think that every major province of India is a large enough country to have at least one central technological institute within it?—A. Yes.

Q. You are in favour of importing experts where necessary to push forward industries?—A. For new industries in this country.

Q. And you think that if the Government should help the promoters of new enterprises to bring in the right kind of experts, that itself would give a great impetus to the proposed industries?—A. Yes.

Q. You say "I have invariably seen that labourers having a little education turn out more efficient within a short time than others without it." You also say, "In order to increase the efficiency of skilled labour and to create a taste for the work, I would suggest the establishment of an arts and crafts institution in Calcutta." In your travels in England, America and Japan have you noted that the general education which artisans and labourers receive there promotes their industrial efficiency?—A. I have.

Q. They are far more intelligent than our Indian labourers are?—A. Yes.

Q. Do you think then that if the Indian labourers are to compete successfully with the Japanese, or English or German.....?—A. In Calcutta the Bengali carpenters are being replaced by Chinese carpenters. It is very difficult to find a good Bengali carpenter.

Q. In order that the Indian labourers should be efficient industrially as the English, Japanese, or the German labourers are, you think it essential, that they should receive general primary education and in addition should receive technical and industrial education?—A. Yes. As is done in the arts and crafts institution.

Q. You recommend the formation of a co-operative bank with a minimum interest guaranteed by the Government, to finance industry?—A. Yes.

Q. Do you think it would be enough if there were one such bank in each province, or do you want branches in the districts?—A. It will have branches in each of the districts.

Q. Have you in your experience felt the need of such a bank?—A. Yes.

Q. Have you in your travels in Japan noted the existence of such an industrial bank?—A. The first industrial bank of Japan was established shortly after the Restoration.

Q. And there are many such now?—A. Yes.

Q. Did you also note the existence of banks in Germany which finance industries?—A. No. I did not enquire.

Q. You have spoken of the railway freights affecting trade and you have given some very remarkable instances of differences in the rates. To whom did you make your representation on the question of rates?—A. We made one direct representation so far as our sand is concerned to the Railway Board, and they said they could not interfere. This was in 1905.

Q. Did you point out that the sand was required for plastering purposes?—A. It was only to reduce the freight on sand. We wanted to bring that sand from Rajmehal, but owing to the heavy freight we could not do it.

Q. You say, "I find in the railway tariff that sand used for plastering purposes has got to pay rates higher than chemicals, such as Epsom salt, while the value of one is thirty times as much as the other?"—A. Yes.

Q. You did represent to them that the rate on sand was very heavy?—A. Yes. On that subject one of the proprietors of the works will be the next witness coming and he will be better able to explain it.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Before you went to foreign countries for this technical instruction what education had you?—A. I appeared for the B. A. examination in science.

F. N. Gooptu.

Q. You never attended any technical college?—A. There is no technical college here.

Q. You got your experience chiefly in Japan?—A. Yes. I was in the Higher Polytechnic in Tokyo for two years. At that time it was very easy for an Indian to go there. Now it is difficult so far as I have heard. I have been there once in 1909 also. At that time I found no difficulty in entering into it. Then I found my admission into the Testing Laboratory and worked for 1½ years. Six months I then spent in travelling and returned.

Q. Were you the head of any department in those works?—A. I was taken as a student.

Q. They willingly taught you?—A. Yes.

Q. I suppose you have no experience of the oil mills in Calcutta?—A. No special experience. I only got some information from reliable authority.

Q. You say, "Now the total output of edible oils, if all the mills are fully worked, is far more than the local consumption, hence the mills are obliged to shorten their hours of work." Do you know what is the imported quantity of foreign oil into this country?—A. I was speaking of oil for edible purposes,—mustard oil meant for human consumption.

Q. You are for the exhibition of the finished articles from foreign countries made out of the raw materials exported from this country so that the people may see the local article and the foreign article?—A. Yes.

Q. You want prices also?—A. Everything that can be done.

Q. Prices fluctuate every day?—A. They can put in the standard price or the average price.

Q. You say, "Managers in Europe of technical concerns are men who have high educational qualifications." That is, technical and scientific and not literary?—A. No.

Q. In your last paragraph you say that you would suggest the establishment of a commercial college at Calcutta?—A. Yes.

Q. Do you think that if a commercial college is established in this part of the country it will get students?—A. Yes.

Q. I ask you because we were told this morning we may not get them?—A. I do not think.

Q. Do you think that the people would like to go in for these studies?—A. Yes. Because other professions are being overcrowded this will be a new outlet.

Mr. Chatterton.—Q. Your practical experience, I understand, is entirely confined to Ceramic manufacture?—A. Yes.

Q. And on other matters your written statement is a record of your opinion based on information collected from other sources?—A. From my own experience.

Q. Do you mean to say that you have a practical knowledge of tanning?—A. No. Only from the Trade and the Navigation Report of Bengal I wrote it.

Q. You spoke of raw materials going out to foreign countries and coming back as manufactured goods?—A. Yes.

Q. What raw materials?—A. Oil seeds.

Q. How do oil seeds come back as manufactured goods?—A. Linseed oil comes in large quantities made up into paints and other products.

Q. Are tannin extracts imported into India?—A. I heard so.

Q. You have made a statement that raw materials go out of the country and come back as manufactured articles. I should like to know what are those manufactured articles which come back from abroad made of Indian materials?—A. Linseed oil.

Q. What other manufactured goods come back?—A. (Witness was not able to name any other goods.)

WITNESS No. 84.

MR. F. N. GOOPTU, Proprietor, Messrs. F. N. Gooptu & Co., Manufacturing stationers, Pencil makers, etc., Calcutta.

WRITTEN EVIDENCE.

Qs. 1 & 2.—I have had no direct personal experience in raising capital for industrial enterprises and cannot therefore state the difficulties that may be experienced in doing so. I was for some time connected with the Bengal Luxmi Cotton Mills, Limited, while capital was being raised and my experience is that the capital for that particular industrial enterprise was principally drawn from the small savings of the lower middle classes. Well-to-do and the wealthy classes held aloof from subscribing either substantially or considerably to the capital.

Q. 5.—All the seven methods of giving Government aid to existing or new industries mentioned in question no. 5 have my entire approval. The view that I am inclined to take of the present industrial position in this country is that existing and new industries are handicapped by lack of initiative, want and shyness of capital and other allied reasons.

ement
nce.

and it is my conviction that there will be no marked improvement in the industrial position of the country until and unless a big push is given by the State and that push will naturally assume one of either of the various shapes suggested in the question. Money grants-in-aid may very well be given with proper guarantees to existing industries which are struggling for want of financial help and which after such help may become prosperous. Similarly new industries soundly conceived and for which there is admitted scope may very well be helped with money grants-in-aid. As regards the second method, bounties and subsidies may prove of invaluable help to the export of manufactured articles to compete in markets where bounty-fed articles are dumped.

Guaranteeing dividends by Government for a limited period may be done in the case of both existing and new industries, e.g., in the case of an existing industry when it is doing fairly well but requires fresh capital to increase its capacity of production to meet demand, but is unable to attract fresh capital on account of the difficulty in guaranteeing a good dividend; the Government may here very well step in to help this industry.

I strongly approve of the fifth method of the supply of machinery and plant on the hire-purchase system because it combines to my mind the minimum of risk with the maximum of helpfulness. The machine so supplied will always be under the Government who should have a lien on it and Government may also arrange that it should be inspected from time to time to see whether it is in proper working order. By this arrangement Government will stand to lose little or nothing while the individual or the firm so helped will be materially benefited. It will be an incentive to manufacturers to adopt new and latest methods in their business and will give employment to more skilful men or artists. Government might further help by placing orders for the output of this machinery should the supply prove satisfactory under the seventh method, viz., guaranteed Government purchase of products for limited period.

In my experience I know of a case in which a gentleman started a business with a small capital of his own with the expectation that he will be able to raise capital if he can survive the experimental period. Unfortunately he could not manage it with his own capital and had to close up and sell the factory to another person. In another case the originator of the enterprise after making his enterprises experimentally successful could not get a proper partner or capitalists to finance him and had to close up his business.

Q. 6.—In methods (3), (4) and (6) and the form of control as suggested should be by the appointment of Government Directors with defined powers for the period during which direct assistance lasts.

Qs. 7 & 8.—I have no experience of Government pioneering factories but I am sure Pioneer they must be of great value as a stimulus to industries. In every instance care should be factories taken that no Government pioneered industry comes in competition or conflict with industries already flourishing and also that the original intention should be to place such industry in hands of others after it has proved a success.

Government should pioneer industries which, if advised by their experts after due investigation, are likely to be successful from a financial point of view but which have not been taken up by private enterprise and the extent to which such industries should be pioneered should be the established success of such industries. I do not think it would be right in any case to close successful pioneer factories but they should in every case be handed over to private capitalists or companies. The conversion of successful pioneering experiments into permanent Government enterprises should be avoided as a rule.

I may here include questions 19 and 20 relating to demonstration factories. These Demonstration factories should certainly be established in my province as well as elsewhere not only for the factories purpose of experimentation but also to train experts in new industries and to grant commercial education to the young men. The special aim of these demonstration factories will be not only to create an expert, a workshop manager, a man of business but also a foreman or a clerk. These demonstration factories must form a part of an industrial school where a course of commercial training can be given to the pupils to complete the commercial side of the expert. An expert is not always a good commercial or business man. An agricultural school with a farm and an industrial school with a workshop may be started.

In Germany there are "manufacturing laboratories" employing experts and 120 men and carrying on technical investigations to aid in manufacturing works of its founders. In this connection I wish to mention that it is absolutely necessary to establish an up-to-date manufacturing workshop and laboratory to tackle the important questions of jute mills and to help the Government in the manufacture of munitions.

Qs. 10 & 39.—Some of the various ways of giving substantial assistance to industrial undertakings by existing or new banking agencies are as follows:—

1. By credit system. By this I mean (a) that by depositing a certain amount of money in any bank, a facility is obtained of purchasing machinery and plants from foreign countries; (b) by advancing money on the acceptance of hundis by a respectable solvent party; (c) by advancing money on the hypothecation of goods and plants and machinery where necessary.

2. By giving financial facilities in time of urgent need on a moderate rate of interest. For example, suppose a firm wants to make a big payment in the mofussil for

Financing agencies and banking facilities.

purchasing a large quantity of raw materials, the bank on the application of the party and on the security of the firm ought to arrange for the temporary accommodation on a moderate rate of interest.

3. By negotiating Bills of Exchange.
4. By acting as a collector of money on hundis accompanied with shipping or railway documents.
5. By granting loans on the recommendation of Government experts to industrial enterprise whose success is otherwise assured.

Co-operative societies.

Q. 12.—In my opinion small or cottage industries are likely to be helped by co-operative societies. These industries do not require a large capital while they are not of a speculative nature. They would certainly benefit by the help of co-operative societies and would substantially increase the material prosperity of the people. The organisation of these societies should generally be on the same lines as those of the existing co-operative credit societies. They should be brought nearer to the people by the inclusion of the people on the governing bodies. The special object of these societies should be to give financial help to small village and cottage industries and to induce people by example to save money by investing small savings which they have got in the co-operative society in their village. This system will help not only the small and cottage industries but will be a great boon to the cultivator class and also to the zemindars.

Limits of Government assistance.

Q. 13.—Government aid should first be granted in any of the shapes mentioned in clause 5 to deserving existing private enterprises. In no case should Government pioneer the starting of an industry similar to one already existing in the same province. The existing company should first be given a chance to improve and to meet the public demand and if it fails then a similar industry on an approved line may be started.

There ought not to be any limitation to Government aid to a new enterprise even if it competes with an established external trade so long as Government would be convinced of the ultimate success of the concern. Proper control should always be kept over the enterprise so long as Government aid continues. The main object of this aid ought to be the establishment of such factories in India as will be able to compete side by side with any imported goods whatsoever.

Technical aid.

Q. 15.—I have no personal experience on this subject. But I know that in Madras the experiment of ground-nut pressing has reached a successful stage and Government is helping a private party to make this a successful commercial enterprise.

Q. 17.—Government experts ought to be allowed to work for private firms or companies. An expert may be lent to an industrial enterprise (1) for a short period free of all charges to help the company to overcome some difficult manufacturing process; (2) as paid adviser for a long period to help the promoter of the industry from the beginning to train up his own men and to run his concern in the proper lines thereby saving a lot of money in the experimental stage; (3) as a consultant free of charge to advise whenever required by any company or firm; (4) as an expert in organising a new concern as to the pros and cons of starting an industry in any province and of the suitability of any particular industry.

Q. 18.—The results of researches of Government paid experts while attached to a private business may be allowed to be published so long as the same is not detrimental to the interest of the party concerned or is of such an importance that many concerns will be benefitted by its publication. The results may be published in a particular magazine published in the same line as "American Scientist," "Machinery," etc.

Research abroad.

Q. 22.—I would rather prefer researches to be conducted in different parts of India, as experts from foreign countries always find various difficulties when they come to India to work for any industrial concern.

Surveys for industrial purposes.

Qs. 25 & 26.—I am of opinion that an industrial survey on a large scale may be arranged by the Government with the co-operation of private qualified men to explore the vast tracts of India still lying untouched, e.g., virgin forests of the Mourbhunj Raj, the mineral tracts of Bengal, United Provinces and Rajputana. The precise objects of such a survey will be the discovery of various rare and valuable minerals and of forest products and of suitable areas for the growing of particular crops, thereby bringing about the expansion of existing or the creation of new industries.

Q. 27.—By the publication of the results in the Government publications under the Director-General of Commercial Intelligence and Director of Industries whenever required by any company or firm.

Commercial museums.

Qs. 28 & 29.—My personal experience and opinion of commercial museums are that they serve a very useful purpose in the industrial world. I have obtained a large number of customers after the first tour of the commercial museum organised by Mr. A. H. Ley, I.C.S., and worked by Mr. P. R. Rice. It served the purpose of not only bringing together customers and manufacturers but of an advertising medium. It is very useful for small industries and unorganised cottage industries. It helps everybody to find what can be manufactured in India and thereby helping to establish business relations with various parts of India and also with the foreign countries.

Q. 37.—I may here suggest that another section ought to be added in the commercial museum in Calcutta, viz., the section displaying imported samples with approximate requirements of the Government of India to enable manufacturers to tackle them. These museums should be developed and established in each commercial centre under a curator assisted by an efficient staff of assistants controlled by the Director of Industries. There is a general complaint that manufacturers cannot supply goods when ordered. To rectify this defect, the Director of Industries ought to take up such cases and find out the real cause of the complaint and do the needful. I approve of the method of working as is followed in the museum in Calcutta.

Q. 30.—In my experience I have found that the products of minor and unorganised cottage industries can be sold very conveniently if a permanent commercial emporium is established in the centre of the shop quarter of Calcutta. Its development may be effected by allotting to each applicant a small stall at a very moderate rate where the products can be displayed and sold to customers. A small section of our Sir Stuart Hogg Market if let to manufacturers on a cheap rent may very well serve this purpose. The aim of this is to place various kinds of products in one place for the convenience of the buyers and visitors.

Qs. 31-33.—Industrial exhibitions if carried on on the basis of the great International Exhibition held in Calcutta in 1884 will be very useful to encourage industries in India. The main object of the exhibition will be to demonstrate the methods and the latest appliances used in other parts of the world in the Industrial and Agricultural Departments. This form of exhibition ought to take place once in every 10 years.

In addition to the above during the intermediate period exhibitions in the form conducted at Calcutta in 1906 and at Allahabad in 1910 will serve a very useful purpose. In short there must be demonstration departments in these exhibitions. Government must take the initiative and encourage these exhibitions through the Director of Industries.

Qs. 34 & 35.—It would be certainly an advantage to appoint trade representatives for the whole of India in Great Britain, the Colonies and Foreign countries. Only experts or men having special knowledge of trade can be so appointed and their duties should be to advise the Government of India and representative bodies of the trading community in India about the possibilities of trade between the countries to which they may be appointed and India in respect of articles of Indian manufacture or produce, i.e., export trade. Temporary commissions for special enquiries may also be appointed.

Q. 36.—Inter-provincial trade representatives in India would be of great help in promoting trade between the different provinces. The representation might be arranged for by nominating qualified men in the different provinces to communicate with one another and advise the Government and tradesmen from time to time.

Q. 39.—A central Industrial Bank for every province with branches at all industrial centres should be established under the supervision and control of Government. These banks should help in marketing indigenous products and should give reasonable credit to industries.

Q. 40.—The conditions should be:—(1) that the Government should derive no profit and should realise only the cost of raw materials and that of supplying it: (2) that payment should be made easy either by instalments or hire-purchase system or by following the bank system of realising demands on invoices after sixty or ninety days: (3) that the materials should be supplied as promptly as possible: (4) that the rates must be fixed on a yearly basis.

Q. 41.—At present industrial development suffers much from the various forms of control by means of licenses from the municipality regarding permission to use land for industrial purposes. There are two forms of licenses to be paid to the municipality, one for using a particular plot of land for establishing factory and the other for storing up raw materials and carrying on business in the same place.

Government assessments ought to be reduced on lands totally used for industrial purposes as they generally do in case of public buildings and those used for worshipping places.

Municipalities must not enforce all the strict laws relating to sanctioning buildings for industrial purposes, e.g., erection of mill-houses and workshops.

I know of a case in which sanction was refused to erect washing platform and w. c. on the side space in a factory. This case was referred to the general committee and the plan was passed after a long time.

Q. 42.—Each case of concession will have to be dealt with on its own merits. In the case of new industries it may be necessary to grant land rent-free for a fixed period, after which, the industries having meanwhile become profitable, land revenue with arrears may be gradually realised. In the case of existing industries land may be granted on a reduced rent.

Qs. 44 & 45.—In our province skilled labourers are very rare and costly. Labourers with ordinary intelligence form the greater part of men employed in industries. In my own business I have always taken care to employ some very best skilled men and to use them to teach, train-up in special lines quite a lot of young adults with common intelligence and make them fit for handling machinery properly. I have always given them encouragement by increasing their pay when I found them useful. I practise in my establishment the premium

system of wages as advocated by the Americans to "reduce the cost of my production or in other words what is known as "High wages with low cost." I give my head mistries chances to suggest improvements in the method of manufacture and invention of new machine parts whereby our output can be increased and give them bonus when the attempt becomes successful. I have derived very good results out of all the items mentioned above.

In my opinion labourer's efficiency and skill can be increased generally by (1) allowing them to associate with best skilled trained men, (2) giving them facilities to improve and paying them when they do so, (3) teaching them the principle of co-operative credit system, and (4) teaching them to take interest in the concern where they are working by sympathetic treatment.

ining of labour
l supervision.

Qs. 46 & 55.—Apprentices trained up in factory and workshops sometimes turn out good mistries in the end. These apprentices are made to undergo a course of at least 5 years during which time they get graded monthly allowance just sufficient for their food and clothing. During the period some of the workmen acquit themselves very cleverly and are promoted. These apprentices are made to attend factory works during the day and night classes in established schools to learn drawing, mathematics and English. If this system is made universal and free industrial schools are established, workmen of better calibre as well as men required for the various departments of business can be trained up very easily. These schools should be under the control of the Department of Education and there should be three standards in them. The first standard will be such as to create a man of business, a merchant, a trader or an expert. The second standard will be to create head clerks, accountants, auditors, cost clerks and stenographers and the third will be to create head mistries, draftsmen, mistries and skilled labourers generally. Best results will be obtained by making apprenticeship system co-ordinate to industrial schools so that boys will be compelled to learn something if they want any mechanical training.

Departments of Education and of Industries can be made to work in unison in controlling industrial schools if the Industries Department give facility by employing the deserving candidates passed from the industrial schools in their respective spheres. Uniformity of standards of examination for mechanical engineers held in various provinces must be kept up. Men who qualify themselves in the first standard creditably ought to be allowed to study conditions and methods in other countries under private or State scholarships, thus helping them to complete their training. Technical and commercial trainings are absolutely necessary for a prime mover in any concern whatsoever.

cial organisation.

Q. 56.—My suggestion is that Provincial Departments connected with industrial enterprise should be established and developed. In this connection I beg to propose that Provincial Directors of Industries assisted by technical experts and advised by Boards of Industries consisting of non-official members also should be established as is now in vogue in Madras. Our main ground of supporting the above proposal is that the Director of Industries being at the head of an organised Department and assisted by experts will be able to carry on experiments on all the different items as named below :—

- (a) Chemistry including agricultural, metallurgical, tinctorial and pharmaceutical chemistry :
- (b) The leather and hide industries :
- (c) Glass-making :
- (d) Sugar and alcohol manufactures :
- (e) Paper making :
- (f) Oil-seed industries :

at a nominal cost, being able to gather correct information regarding raw materials and procuring same at a nominal cost through the other Departments of Government. This process is likely to lessen the initial costs of the experimental stage of industries as practical results of his experiments should be available for all people willing to invest in such industries. He should be competent to visit factories on special request from the party concerned and to give them such advice as to overcome their difficulties.

Regarding relationship of Provincial Industries Department with an Imperial Department I suggest (1) the Imperial Department should have power to govern and control the various Provincial Departments: (2) It will consider and give effect to proposals recommended by the Provincial Departments: (3) It should dictate the broad lines of action of the Provincial Departments who should go more into details regarding the questions arising before them: (4) The Imperial Department, as implied above, should be vested with powers which should steer a middle course, that is, it should not be vested with statutory powers to control the smaller and more specialised details but on the other hand its functions should not be purely advisory.

erence libraries.

Q. 78 & 79.—I have found from my experience that there are hardly any technical and scientific works of reference worth naming in the Imperial Library in Calcutta. It is absolutely necessary for Government to establish a Department collecting all the latest technical and scientific works published all over the world. Without such a library no commercial college will be complete.

ages of com-

Q. 80.—A college of commerce is necessary in our province. In this college the higher standard of the industrial school will be taught. The main object of this college will be to

create, as I have said before, a man of business, a merchant or a trader. Preference should be given to merchants and traders to have their sons trained up in this college. Attached to this college there must be a well-equipped chemical laboratory where analytical works can be carried on by experts.

Q. 81.—This college can be of great help to the development of industry if they create a department wherein minerals can be thoroughly analysed and experiments taken up on the application of any particular concern regarding their particular difficulties. It can also find out other new lines hitherto unexplored out of the raw materials obtained in India in large quantities specially in the preparation of drugs and aniline and vegetable dyes.

Q. 82 & 83.—The Director General of Commercial Intelligence and the Director of Statistics should collect all available information and statistics and should place them at the disposal of the Imperial Department of Industries who will cause the same to be circulated to all the Provincial Departments under it. Statistics and commercial intelligence.

Q. 84.—Indian Trade Journal helps the industrial people a good deal. It circulates information of various industries which have been started in a businesslike way and which have got prospect of success. Also it informs the public the location of possible industries, the presence of raw materials and how these raw materials can be profitably utilized. In short it deals with various important matters directly connected with industry and trade. Personally I gained much from the publication of a short editorial note regarding my concern in the copy of the Indian Trade Journal of 1st October 1908. Industrial and trade journals.

Q. 85.—Government ought to establish and assist industrial and trade journals.

Q. 86.—Dealing in general and special industries these journals or pamphlets should be supplied free of charge to all applicants. They ought to be printed and published in three languages, *e.g.*, English, Bengali and Urdu so that they can be read by the people of India.

Q. 87.—The publication of special monographs will be of very great importance regarding the sources of raw material and possible scope of a particular industry. Copies of these publications should be sent to industrial concerns directly concerned with the subject dealt, *e.g.*, publications of Forest Departments regarding wood ought to be sent to firms directly connected with the manufacture of wooden articles. Other Government publications.

Q. 88.—Government ought to invite information from parties directly concerned in research works on particular branches of industry.

Q. 89.—Government certificates of quality should be established for (1) products used by the Government of India, (2) chemical and pharmaceutical products, (3) paints and dye stuffs, (4) food stuffs. Certificates of quality.

Government certificates must be made compulsory for chemical and pharmaceutical products. This is absolutely necessary as the consumers can easily be convinced that they will not be cheated in buying a thing which bears the Government "hall mark." It will greatly help the circulation of a really good thing without being hampered by bogus and worthless competition.

Q. 90.—The Government college of science and commerce should do this work and their certificate will be quite sufficient for the purpose.

Q. 91.—Medicines, foods, dye stuffs.

Q. 92.—This should be done by surprise visits by Government experts to factories for securing ordinary samples for chemical examination. Prevention of adulteration.

Qs. 93 & 94.—The present state of Indian law relating to marks and descriptions of proprietary and other articles of trade is very unsatisfactory. Parties directly infringing the law get off very easily as these offences are not treated as criminal offences. Formerly cases of infringement of trade marks and trade descriptions were severely punished sometimes with imprisonment. At present such cases are looked upon as civil cases of damages. From my personal experience, I think that law relating to trade marks and trade description of proprietary and other articles should be altered and more strictly enforced. Misdescription.

Q. 95.—The patent laws at present in force in India are hardly worth the paper in which they are written. They should be properly reformed and enforced. Patent laws.

Q. 96.—It is desirable to introduce a system of registration or disclosure of partnerships. Registration of partnerships.

Q. 97.—The lack of transport facilities by road, rail or water hinders industrial development in our province, very seriously. Railway Company should provide applicants with waggons in any station where they are wanted. Loading platforms should be established as near as possible to exporting centres. Moreover, the steamer companies charge very excessive freights which in some instances are over one-third of the price of the raw material as there is no regular service in the locality. Regular steamer service ought to be established with British East Africa where various sorts of raw materials can be procured. Also there is no regular steamer service with various parts of India, *e.g.*, between Calcutta and Madras. This ought to be started. Roads, railways and waterways.

Q. 98.—The freights charged by railway companies are very excessive. They have two kinds of rates, one is known as the tariff rate and the other ordinary rate. These tariff rates are not known to many people and are not communicated to intending importers by the

railway offices. Necessarily ordinary rates are generally charged. Moreover it may not be possible to obtain a full waggon load of suitable timber in one neighbourhood, but the railways charge freights not for the actual weight carried but for the full capacity of the waggon. Another point is the exorbitant charges in freight made by one railway for allowing waggon of another company to travel over their lines, e.g., Bengal Nagpur Railway waggon travelling over Eastern Bengal Railway from Dock Junction to Sealdah, and undue delay is made in similar transshipments. Another instance I wish to bring to the notice of the Commission is the exorbitant rate charged by the railways to carry Indian made articles from the manufacturing centres to other parts of India, thereby seriously handicapping the progress of industry in different parts of India, e.g., railway freight charged for goods despatched from Calcutta to Madras is more than that charged for similar goods of equal weight from Japan to Madras. I should like to recommend that railways (1) should only charge for the actual weight carried as the fixing of the capacity of the waggons is open to various sorts of comment: (2) that regular standard of the tariff rate should be fixed for transport between any two stations: (3) goods intended *bond fide* for manufacturing industrial purposes should be treated as Government goods and should be charged half rate: (4) a special rate should be charged for forwarding Indian made goods from one part of India to another thereby giving facility for the consumption of Indian made articles.

at Department.

Q. 105.—From the point of view of industrial enterprise, I wish to comment on the method followed by the Forest Department regarding disposal of the trees within the jurisdiction of the Conservators. They sell to a contractor all the trees growing in a certain area. This contractor disposes them of in the way he thinks best. In some cases the Conservators even refuse to sell trees wanted specially for manufacturing purposes within a certain area. The factories find it difficult to get into touch with the contractor and so obtain a sufficient special variety of wood they require. Moreover, these contractors charge excessive prices for supplying these woods. In my opinion where a special variety of wood is required for a new industry, the Forest Department ought to make special arrangements for the supply of the wood direct to the party or through the contractor on favourable terms. This procedure, I am informed, has been followed in the case of Upper India Timber Company's match factory by the Government of the United Provinces.

oral.

Q. 110.—The following are my suggestions regarding the development of industry in which I am personally concerned:—

- (1) The service of a first class expert in pencil-making is necessary for a limited period.
- (2) The service of a first class expert in colouring and varnishing is necessary for a limited period.
- (3) Some latest automatic and up-to-date machines are necessary on hire purchase system; machinery and its price should be selected and settled by us.
- (4) Special concession regarding freight both of railway and of steamer service in and out of Calcutta.
- (5) Guaranteed Government consumption of our manufactured goods.

Q. 111.—I suggest the following new industries as peculiarly suited to India:—

- (1) Chemical and pharmaceutical works.
- (2) Vegetable colours.

Q. 112.—The supply of mica for use in industry or trade is retarded by preventible causes.

ORAL EVIDENCE, 28TH NOVEMBER 1916.

Mr. C. E. Low.—Q. I understand that you are concerned with pencil and stationery manufactures?—A. Penholders, pencils and nibs at present.

Q. Is your concern a private partnership or a limited company?—A. It is my own firm. It is a private firm. It has been carrying on business since 1905.

Q. You supply a certain amount of goods to the Government?—A. Penholders.

Q. Including pencils?—A. We at present supply pencils to Government.

Q. You began to supply them a year or two ago?—A. Pencils were supplied two months ago.

Q. You get your wood from Africa?—A. Yes.

Q. You can find no Indian timber which is suitable?—A. I tried several timbers from the Maurbhanj forest but none of them were successful.

Q. Did you obtain information from the Forest Research Institute or the Forest Department about the kinds of timber suitable for pencil-making?—A. I had some communications and got some information about juniper. Later on I organised a party and made research myself in the Bengal forests and got hold of several timbers which could be had from a short distance of Calcutta. Two of them we found to be successful.

Q. You think that juniper does not exist in sufficient quantities to be available for this purpose?—A. Especially it is very costly. You cannot sell it in competition with foreign goods.

Q. Do you find any difficulty in financing your business?—A. For the first six years I had to suffer every difficulty, and I went on experimenting and trying to solve my difficulty, and I afterwards succeeded.

Q. Did you obtain the help of any bank for working capital?—A. No.

Q. Or private money-lenders?—A. I had my own money at my disposal.

Q. You did not go beyond what you could provide yourself?—A. No.

Q. If you had more financial facilities given you could have extended your works more rapidly?—A. Yes.

Q. You felt the pinch of lack of capital?—A. I did not want to go to anybody to ask for capital, because our people do not attach much importance to these preliminary enterprises. First of all, we must make it a success and then of course if they like they may come and help us.

Q. You are not prepared to go to the public and obtain money. Do you think it is worth doing now or can you manage without?—A. I am not in favour of going to the public.

Q. Do you consider that, in the case of any new enterprise if the Government gave facilities for technical investigation of the different things which were required to be found out and the reports were satisfactory, the people would put money into it?—A. In some cases they would.

Q. Enough to enable the industries to start, or would further assistance be required from Government?—A. If it be a new industry, of course in the experimental period it ought to be supported by Government.

Q. You think that if it were a new industry it would not be supported unless it was worked on an experimental scale?—A. Unless the success is guaranteed by Government experts or the Government pioneer the industry.

Q. By guaranteeing you mean that the Government should make good the loss if it failed?—A. The results of the experience of the Government during the experimental period will be available to any person who will invest money.

Q. Do you think that an industrial bank is required?—A. Yes.

Q. How would it raise its money?—A. Government can support it by taking part of the shares of that banking corporation, and thereby give inducement for private capital to come to the bank.

Q. If Government took a number of shares it would encourage private people to put money in?—A. Yes.

Q. Have you had any assistance from the Calcutta commercial museum?—A. Yes. I got my things circulated during the tour of the commercial museum all over India.

Q. Do you think it would be advantageous if you had commercial museums in other provinces as well?—A. I think so, and there should be some interchangeable system.

Q. You suggest an emporium for cottage industries in Calcutta. Who would sell the things?—A. It may be organised by a committee, or there are some firms who will take care of their own goods. There ought to be a committee for the sale of these goods.

Q. Do you think that the artisans will have confidence in that committee?—A. If it is controlled by a Government official they will have confidence.

Q. You say, "Government assessments ought to be reduced on lands totally used for industrial purposes." Would you apply it to a jute mill?—A. I have taken into consideration the starting of new industries.

Q. How much is the Government assessment on such lands as a rule?—A. It depends upon the rent of the place.

Q. It is a tax?—A. Yes.

Q. Have you any apprentices?—A. No.

Q. Do many people apply to you to be taken on as apprentices?—A. I have already taken two or three to work in my factory, but they are very reluctant to take up the work on the same level as mistries.

Q. They want to take higher posts of responsibility?—A. They want to be treated on a higher standard than the mistries.

Q. In what way?—A. They do not want to attend properly at the factory hours and want to avail themselves of the holidays and Sundays.

Hon'ble Pandit M. M. Malaviya.—Q. You are strongly in favour of Government supplying machinery and plant on the hire purchase system?—A. Yes.

Q. Would you limit it to cottage industries or would you go beyond that?—A. Even beyond that. In the case of larger industries also.

Q. You advocate the establishment of a central industrial bank for every province with branches at all industrial centres under the supervision and control of Government. Do

you mean by the nomination of directors, or merely by means of an independent audit by Government auditors?—A. There must be a director on the board nominated by the Government.

Q. You complain of the land policy of the municipality. Don't you think that the restriction regarding the creation of a factory within municipal limits are laid down in the interests of sanitation?—A. Yes. When once a particular site is approved of and a license granted to a party for establishing a factory, it should not have to be renewed every year.

Q. Has the license to be renewed every year, or have you to pay a certain amount of tax?—A. There are two kinds of license, one is a trade license and the other is a health license.

Q. Have you to get a license for the factory every year?—A. We have to pay Rs50 every year to the Corporation.

Q. Suppose you failed to obtain a license, would you have to close it?—A. I would be under the penalty.

Q. Have they any power to refuse you the license?—A. That depends upon their choice. I had very great difficulty in securing a license in the first instance and having got it I am getting it renewed every year.

Q. I take it that once you have obtained a license you have to pay a fee every year and then they will not cancel the license except for special reasons?—A. Yes, but I have not heard of any case about cancellation of the license.

Q. You speak of the system of apprentices being trained in factories and of the education that they should receive. Don't you think that a general system of elementary education supplemented by technical instruction would be better than this system of apprenticeship?—A. Practically the same thing. When they get apprentices in the factory they are ordered by the factory to go and study in the night school.

Q. Would it not be preferable that they should obtain a certain amount of general education and then go to the factory?—A. Our poor people cannot afford to do so.

Q. At what age do you get children into the factory?—A. If it is not prohibited by the Factory Act, from six years upwards.

Q. At that tender age boys cannot do much work?—A. They will be better at that time in the general primary school? But they cannot afford to get their food. We pay them something for food, as food allowance.

Q. You say that there are very few technical and scientific works of reference in the Imperial Library at Calcutta?—A. Yes.

Q. Have you brought this matter to the notice of the Council of the Library?—A. No.

Q. Have you brought the inequalities in freight charged to the notice of the Railway Board?—A. I had a particular case of mine. I applied to the Traffic Manager and put the case before him and after a long time, i.e., six months, I got a refund. My case was heard and it was decided in my favour.

Q. You say, "the railway freight charged for goods despatched from Calcutta to Madras is more than that charged for similar goods of equal weight from Japan to Madras"?—A. I brought it to the notice of the booking office authorities. They told me that if I described my goods as country made goods I might have a chance. I did so but nothing happened.

Q. You did not persist in making your representation?—A. I went on describing my goods as country made goods but I have not got any advantage.

Q. Are you not able to raise the necessary capital to bring about the improvements that you mention in answer to question 110, in your own factory?—A. I have got experts at present. I am not satisfied with their knowledge. In order to compete with the imported pencils and to meet the requirements of the market especially of the Government of India I require a little assistance and encouragement from Government. Moreover I have not got the opportunity of knowing a really qualified man in my line who will be able to help me.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Can you tell us what made you to start this pencil factory? Have you had any experience of this line?—A. No. It was long before the Swadeshi movement.

Q. If you have no objection will you tell us what capital you have invested in your industry?—A. 3½ lakhs.

Q. Were the Government buying your products before the war?—A. Yes. Within a year or two of my starting they purchased. I think it was in 1907.

Q. When you talk of Germany and the manufacturing laboratories, have you got any experience of that?—A. No. I read in books.

Q. About cottage industries, what industries you think ought to be started?—A. Textile industry, handlooms, pottery works, agriculture.

Q. When you talk of the International Exhibition of Calcutta and the Allahabad Exhibition do you know what money was spent on it?—A. As regards the International Exhibition, of course, my information was from my father. He was one of the members of the executive committee and what I have heard is from him. A good deal was spent on it.

Mr. S. N. Dutt.

Q. Do you know if there have been any good results from the Allahabad Exhibition where a lot of money was spent? Do you think that it is a benefit to spend money on this kind of exhibition, or do you want permanently small exhibitions, that is, district exhibitions?—A. In district exhibitions exhibits do not come from far-off places, and we have no opportunity of seeing what other provinces are producing. If they are made permanent and an interchanging system of exhibits is introduced, then we can have the advantage.

Q. You do not know what money was spent on the Allahabad Exhibition?—A. I do not know. So far as I have heard, it was not a financial success.

Q. You are in favour of our representatives in the other countries for trade purposes?—A. Yes.

Q. Do you think that will benefit us?—A. Yes. I know a friend of mine who went to America and set up a trade in lace and he did very good business.

Q. You can do a lot of export trade from India?—A. Especially Agra toys.

Q. You are for a central industrial bank. For each province or for the whole of India?—A. One central bank is quite enough with branches.

Q. In what way is the Government to help that?—A. Government ought to take shares in that in all different ways. There must be a Government director.

Q. You talk of a college of commerce. Do you know anything about the College of Commerce, Bombay, or its curriculum?—A. No.

Q. About railway freights, have you approached the railway through the Chambers of Commerce?—A. No.

Q. You want better experts in your own factory than you have at present?—A. Yes.

Q. You want Government to give the expert without pay?—A. Not without pay.

Q. If there is a Government expert, you can take his help occasionally?—A. Generally I do not require a whole-time expert.

Q. In your factory you take boys at the age of six?—A. Not as workmen. They are allowed to carry things from one place to another. They are boys 8 or 10 years old. They do as much as they can.

Q. They do not come within the Factories Act?—A. No.

Q. Do you pay taxes to the municipalities?—A. Yes.

Q. I understand that you had difficulties with regard to the supply of suitable wood and I suppose you made experiments?—A. Yes.

Q. Are you getting your wood from East Africa?—A. Yes.

Q. Is there any difficulty?—A. There is no regular steamer service. It takes six months for one consignment to come from there. When they are supplied in logs they are supplied unseasoned.

Q. From where do you get supplies of graphite?—A. My graphite is from Ceylon. They send it in powdered condition and we wash it and free it from all kinds of impurities.

WITNESS NO. 85.

MR. S. N. DUTT of P. N. Dutta & Co., Mechanical Engineers, Bucket Manufacturers, etc.,
Proprietors of the Bengal Galvanising Works, Calcutta.

WRITTEN EVIDENCE.

Q. 1.—In raising of capital for industrial enterprises my experience is limited to small Capital industries. I believe it is easier under the present conditions of India to devise a scheme for the development of industries on proprietary than on joint-stock basis. No industry can be started until we have some amount of capital of our own, which should be sufficient at least to buy the machineries and to set up a factory. The working capital may be obtained on loan. Some amount of credit also may be always had from the parties who supply us the materials. But this is not enough to meet all our demands. When productions and sales work in concurrence the factory runs smoothly, without incurring any debt. But the demands may be fluctuating very often, though the factory wheels have got to be kept on moving always. The result is a large accumulation of manufactured goods and consequent stoppage of circulation of capital. In such emergencies we have to run to the Marwari money lenders who charge a usuary rate of interest, sometimes over 36 per cent. per annum. But if this loan can be obtained from some banks, at a reasonable rate of interest, many a promising factory can be saved from premature death.

I may venture to suggest that an industrial bank, supported by the Government, in the lines already indicated by certain witnesses in their evidence, will be of enormous help in developing the industries of the country. Cheap labour is plentiful here, experts trained in foreign countries are not difficult to obtain, and a small amount of capital is also to a certain extent freely available. If these can be supplemented by some form of banking facilities, I believe a large number of small industries may crop up. This development of small

industries, side by side with the improvement of agricultural industry, will go a great way in diminishing the difficulty which frequently arises out of scarcity due to occasional failure of crops. This will be specially noticeable in joint agricultural families.

Q. 2.—Capital for industrial enterprises, if not a joint-stock concern, can be acquired from the following sources:—

- (a) Owners' own resources; (b) Credit from the vendors or shippers of materials; (c) Bazar money lenders; (d) Dealers for forward contracts; (e) Private parties; (f) Local Banks.

If the concern proves to be lucrative, the difficulties of securing financial support from the above sources are not insurmountable.

Q. 3.—So far as I am aware I may mention only one small industry in which the development seems to be unhealthy and abnormal. There seems to be rather too many small trunk and safe making workshops in Calcutta. They make only cheap and inferior class of goods. None of these factories are equipped with up-to-date machines or processes.

Government assistance.

Q. 5.—(1, 2 and 4). I do not think it is advisable to give money grants-in-aid, bounties or subsidies for building up industries. Advances in the shape of loans at a reasonable rate of interest may be given, in deserving cases, exclusively for pioneering new industries. Any financial help accorded to one out of two or more existing industries will be regarded as an unfair and partial action.

(3) Guaranteed dividends may be desirable only for fostering the establishment of new large industries.

(5) I do not think the supply of machinery and plant on hire purchase system is practicable at all.

(7) Government guarantees for purchase of articles from a local factory for a limited period will be a good impetus and of considerable help in the infant stage of new industries. But if such favours are allowed to existing concerns, it should be equally distributed among the competitors in the same line.

Pioneer factories.

Q. 8.—To promote the growth of new industries, it is not essentially necessary for the Government to start pioneer factories. Perhaps the private individual, naturally zealous of his own interest, can work out a factory more successfully than a factory manager appointed by the Government. Hence if loans are granted to deserving parties in the following manner Government may be instrumental in building up many new lines of industries, without totally losing the money or directly interfering with the trade and commerce. Among many lines of industries, which should be urgently introduced in the country, I may name, as an example, the manufacture of drawing wires of steel, copper, brass and other metals, as well as its auxiliary lines of wire nails, barbed wire fencing, etc. Wire and wire articles are immensely consumed in this country. But unfortunately there is not a single factory, as far as I know, in all India to manufacture them. I think a capital of two lakhs of rupees would be required to start a factory in this line on a decent scale. The Government may issue a circular, gazetting that if any party with a capital of rupees one lakh can set up a factory and can prove that they are in a position to manufacture wires, etc., and can sell them at a fair price in the competitive market, the Government will consider the question of granting to them a further amount of one lakh of rupees as working capital, repayable within a certain period. The Government will of course exercise some amount of control until the loans are paid off. Should the Government elect to start any pioneer concern, it should be distinctly understood that they should be prepared to sell such concern by public auction to the highest bidder, as soon as it comes to the profit earning stage.

Limits of Government assistance.

Q. 13.—Except in cases of new pioneer industries, all the financial help that the Government industrial banks may grant to the industries, should be done strictly on the present banking system. Securities of plants and stock should be properly appraised, and uniform rates of interest charged, so that rival parties in the same lines of industries may have no occasion for grudge.

Commercial museums.

Q. 28.—Since the starting of the commercial museum in Calcutta, our manufactures are displayed there, but I do not remember to have received any enquiry from that source, except on an isolated occasion from the Dum Dum cantonment. I think if a manufacturer can produce the right thing and make it known to the dealers in that line, that he is in a position to sell it cheap, he should have no difficulty in securing a market.

Exhibitions.

Q. 81.—I doubt the utility of industrial exhibitions, as I believe our factory industries have not as yet come to that stage of efficiency. As regards cottage industries I think the exhibitions held in the past, have done more damage than good to them because these exhibitions were, to some extent, responsible for giving birth to factories in foreign countries, equipped with automatic machines for imitating the manufacture of the same articles at a much reduced cost.

Trade representatives.

Q. 84.—I think the industries of India, except perhaps the textiles, are not developed enough to require the appointment of trade representatives. A system of commercial travellers in India may be helpful to the indigenous industries.

Q. 87.—The publishing of the list of articles, used by the principal Government Departments, should be a source of great help to many industries. Every facility should be given for the inspection of samples of stores required by the Government.

Q. 39.—The proposed industrial banks may extend their facilities in marketing indigenous products. Financing agencies.

Qs. 44 and 45.—The labourers' efficiency and skill, in generally or in particular industries, can be improved only in factories under expert supervision. Piece-work, increment, promotions, money prize and such other factory systems are very helpful in the making of an efficient workman. I believe picked men, recruited from new coolies, can be trained to work on any machinery.

Q. 46.—I have found expert mechanics can be made out of apprentices trained in factories or workshops.

Q. 47.—Industrial schools are necessary for making foremen and mistries.

Q. 50.—Industrial schools should be under the Department of Industries which is expected to be more in touch with the practical field of work than the Department of Education.

Qs. 51 and 52.—Supervisors of all grades should have some academic education and also pass through technical schools. His real career should begin from the bottom of the ladder of a factory. And I believe skilled managers will come out themselves from the rank and file. If they are found efficient and promising it is to the interest of the factory owners to send them to study conditions and methods in foreign countries.

Q. 64.—The formation of an Imperial Scientific and Technical Department with provincial branches may be of great assistance to the industries, if properly equipped and administered. Technical and scientific departments.

Q. 71.—I think the technological research institutions should be general in their interest and be maintained as provincial institutions. But instead of being only a professorial or official body, aloof from the public, they should be in closer touch with the workshops, factories, trades and the bazar.

Q. 79.—Reference libraries of technical, commercial and scientific books, most up-to-date in character, is a great desideratum.

Q. 80.—A commercial college, where commercial travellers and business men may be trained, will be useful. It should not be confined to training only typists and clerks.

Qs. 82 and 84.—We have often received various information from the Commercial Intelligence and Statistical Departments. We wish that their scope of utility may be widened by way of greater dissemination of information through publications and other channels, and greater facilities should be given availing of their publications. The Departments should be more popularized than they are now. Commercial intelligence.

Q. 87.—It is doubtful whether sufficient publicity is given to these monographs, forest bulletins, agricultural ledgers, etc. Presumably many good things have been done by Government in this direction but very little advantage is taken of these publications by the public, because they are not sufficiently made known to them.

Q. 98.—Special railway transport facilities and rates are very imperative in the development of industries. Existing railway freights are prohibitive and are in the way of developing the indigenous industries. For instance the freight to-day for shipping canned fruits from Calcutta to London is cheaper than the railway freight from Muzaffarpur to Calcutta. There are many raw materials, abundant in Rajputana or say in Mysore, which we cannot bring to Calcutta at the same rate of freight at which they are taken to Hamburg or Hull. The principle on which the tariffs in India, on railways, are calculated, viz., the waggon load and long lead should not be made applicable in the case of goods manufactured in India. Railways.

ORAL EVIDENCE, 28TH NOVEMBER 1916.

Mr. C. E. Low.—Q. Are you manager of the Bengal Galvanising Works?—A. I am senior partner of the firm. It is a partnership between us brothers, not a public company.

Q. How long has it been going on?—A. Since the last ten years; it started in 1906.

Q. What gave you the idea of starting such a concern?—A. I went to the Paris Exhibition in 1900, and met a gentleman who told me to come to England where he would teach me galvanising. At Staffordshire I learned galvanising. When I came to India I had not sufficient capital to start, but did some commercial business, made money and started the business.

Q. You made enough money?—A. I started with only Rs. 2,000 and had hand machines.

Q. Now you have got larger machinery?—A. All power machinery; we use electric power.

Q. You take that from the Corporation?—A. Yes.

Q. Do you get it on reduced rate?—A. Yes, two annas flat rate.

Q. Did you find it difficult to finance your industry?—A. Of course we sometimes had to go to Marwari moneylenders. That was in the old days. Now we have made money out of the business which is very successful.

Q. Whom do you sell your goods to?—A. We sell in the open market to dealers, those who imported these galvanised goods. They are the distributors of these goods.

Q. You entirely sell to wholesale dealers?—A. Yes, never to the consumer. We never spend a farthing over advertising. Sometimes we sell on forward contracts.

Q. You are finding it rather difficult to get zinc at present?—A. Now there is no supply from Germany. We are using match box zinc. All the match boxes come packed in zinc sheets, which have 98 per cent. of pure zinc, and we buy and melt these sheets.

Q. You are in favour of industrial banks?—A. Yes.

Q. Supported by the Government?—A. Yes.

Q. Where would the bank draw its capital from?—A. Government may purchase some shares, or guarantee dividends, or a deposit of public money might be invited. Government guarantee would be enough for the purpose.

Q. You think, without the Government guarantee, the public support would not be forthcoming?—A. Yes. Since it would be an All-India Bank, the head office may be in Delhi, but we should have branches at the chief trading and industrial centres, and these branches should have sufficient power.

Q. I see you propose in one place that Government might get rid of the pioneer factory by selling such concerns by public auction to the highest bidder, as soon as it comes to the profit-earning stage. Supposing the highest bidder was a foreign firm, who only bought it to close it down?—A. I never thought of that. There would be a difficulty. Of course I mean that Government should not lose anything over it but offer it to the highest bidder.

Q. Provided that the buyer is not likely to act against national interests?—A. Yes.

Q. Have you any educated men acting as your employes?—A. Those that are foremen and headmen; they are educated. They have had a technical as well as academical education, and possess practical knowledge. We get on well with them.

Q. What technical education have they got?—A. They served as apprentices in some engineering firms. Academically they have passed their Matriculation.

Q. Did you try to get workmen with some technical training?—A. No, we just took raw men and gave them some training in our works. That is the best field for technical knowledge.

Q. Have you any apprentices?—A. There are ordinary workmen apprentices in our workshops.

Q. I mean educated men taken on as apprentices?—A. Up to now we have had no occasion. If any are recommended to us, we are ready to take them.

Q. You say, "We have often received various information from the Commercial Intelligence and Statistical Departments"; on what particular matters?—A. On various subjects. We are Tata's selling agents for iron and steel, and they send enquiries to us to make in the market. We write to the Intelligence Department and get replies. We make enquiries about brass and other things.

Q. And do you get prices from the Commercial Intelligence Department?—A. We enquire ourselves in the market, as we cannot rely on the Commercial Intelligence reports, on prices of things.

Hon'ble Pandit M. M. Malaviya.—Q. You would have one industrial bank at Delhi and branches in the different provinces and important centres of trade?—A. Yes.

Q. Would you recommend that Government should take shares in that bank, say for a number of years, and allow the interest on those shares to go towards making up the dividend that may be guaranteed?—A. I think that would be a good course.

Q. You are in favour of industrial schools. At what age would you begin industrial education for boys and girls?—A. After they have passed their Matriculation.

Q. Don't you think it would be enough if they passed the upper primary examination?—A. I mean they should have some sort of general education before they begin industrial education.

Q. Would you admit them at the age of 12 to the industrial school?—A. 12 or 14 would be better.

Q. Up to that time they should have received a general elementary education?—A. That is very important.

Q. Would you make drawing a part of the general education?—A. Yes, that is very important too.

Q. In regard to railway rates, have you made any representation to the Railway Board?—A. I never made up to now, but I know it is a fact that there are certain markets which I should have controlled by my manufactures, but cannot do so on account of railway freights; markets like Cawnpore and Allahabad which are controlled by Bombay. My goods should have gone there.

Q. Are you sure that you cannot bring raw materials from places in Rajputana to Calcutta at the same rate as they are brought from Hamburg?—A. Yes.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You depend entirely on foreign raw materials for your manufacture?—A. At the present moment not entirely; we are dependent for steel sheets, but rods we are getting from Tata's. Tata will be manufacturing these sheets in the course of a few years. Even by being dependent we are in a position to compete with Europeans in their own field.

Q. How would it do if in place of having your factory in Calcutta you had it in Tata's works at Sakchi?—A. No, there would be various other expenses much heavier. I would have to bring down goods by railway, while I am bringing them now by sea which is cheaper.

Q. Then you will have to depend on the foreign market for your materials?—A. The *Babu H. Sen.* manufactured goods will occupy more space than the raw materials; usually they come in for 12/6d., whereas manufactured buckets have to pay 25s.

Q. You will have to depend on Germany for zinc?—A. No, Australia is going to make it now and Japan is already making.

Q. You say about industrial banks, "on the lines already indicated by certain witnesses"; what is your opinion?—A. I say we should have some sort of industrial bank to give us advances on the security of stocks and plant.

Q. You don't get money on plant from any bank?—A. We used to get from the Bengal National Bank, but now we don't owe them anything.

Q. You say, "I do not think it is advisable to give money grants-in-aid, bounties or subsidies for building up industries, etc." Do you know how Japan and Germany became industrially great in the world?—A. I don't know exactly, but my belief is that it is no good helping a man to run if he cannot stand on his own legs. We have some natural advantages in our market, we have a certain amount of materials, and cheap labour and supervision.

Q. Can you get experts cheap? Why bring out experts?—A. We can go and pick up knowledge in Europe.

Q. Have we got facilities to become experts in Europe; do they take us?—A. No one can deter us from going and acquiring knowledge on any subject, if we make up our mind to do it.

Hon'ble Sir R. N. Mookerjee.—Q. You are against the supply of machinery on the hire-purchase system; why?—A. When we want a particular machine we enquire of all countries what is the best machine, and we fix up the price and get one, but with the Government there may be some misunderstanding. The Director of Industries may recommend a certain machine that I do not require.

Q. You have not got money and you want Government help but you object to Government supplying machinery on the hire-purchase system. What objection have you got to this?—A. I am afraid that it will not be practicable; there might be a difference of opinion as regards the maker of the machine or the size.

Q. If a man indents for a certain make Government will get that?—A. Then it is all right.

Q. Then you withdraw your remark?—A. Yes, on that condition.

Q. Are you afraid of competition? Because you have been an exceptionally fortunate man in your industry, you therefore don't want anyone to get help from Government?—A. No, why not let them take the industrial bank's help.

Q. If you were not so successful, would you still say that you do not want Government help for the development of Indian industries?—A. I think it would be of little use to help one until he can exert something of his own powers.

Mr. A. Chatterton.—Q. I should like to get from you the history of your enterprise from the time when you started with hand machines, so as to see how the industry subsequently developed. Will you send us a short note on it? What is wanted are particulars of any difficulties which you experienced and got over, and which at the time, if there had been a Government organisation, you might have had help from. We would like to know some more details on that point, because I noticed in the first few lines of your evidence that you state "it would be easier under the present conditions of India to devise a scheme for the development of industries on a proprietary rather than on a joint-stock basis?"—A. I shall send in a note.*

WITNESS No. 86.

BARU HEWENDRANATH SEN, *Vakil, High Court, Proprietor, the Calcutta Pottery Works, Calcutta.*

WRITTEN EVIDENCE.

So far as our business, *viz.*, the Calcutta Pottery Works, is concerned, the capital financial aid originally required for the business was contributed by us, the three proprietors, *viz.* Hon'ble Maharaja Sir Manindra Chandra Nandy, K.C.I.E., Rai Baikuntha Nath Sen Bahadur and myself. But after investing over two lakhs of rupees when we thought of opening accounts with the Bank of Bengal on cash credit system up to Rs. 50,000, we met with considerable difficulty, as the bank would not open such an account with our concern. But they ultimately agreed to do it with us individually as partners with a solicitor as our guarantor. Every facility should be secured for respectable firms to open such accounts with banks, otherwise it is not possible for any industry to prosper. Then last year, when we found from our experience of the previous sixteen years, that this is a business in which the larger is the capital invested, the greater the profit, we approached the Bengal Government with a proposal to convert our firm into a company of limited liability with a Government guarantee of a 5 per cent. dividend, as we thought that this was the best and surest method of inducing capitalists

* Not received at the time of going to Press.

in this country to invest their capital in industrial enterprises. We had reasons to come to such a conclusion. We know that there is no lack of capital in this country—in fact a very large amount of money is lying hoarded in Government promissory notes or even uninvested, and the owners are most reluctant to invest their money, as they have no confidence in the success of industrial enterprises carried on by us, the Bengalis. The sad experience of the last few years in the failure of several industrial enterprises started by the Bengalis strengthened the suspicion of the capitalists, and it is my firm conviction that unless some enterprises prove successful, the apprehension of the capitalists will not be removed and the capital of the country will continue shy. So with a view to create hope and confidence in the minds of the capitalists, every possible endeavour should be made to make existing business successful or to start such new industries under such arrangements as are bound to prove successful. With this in view I think a Government guarantee is one of the methods which is likely to prove attractive to the capitalists. A guarantee of 5 per cent. will induce the holders of Government promissory notes at $3\frac{1}{4}$ per cent. to convert their notes into capital and invest it in industrial enterprises. Of course, we cannot ask the Government to guarantee any dividend unless they are satisfied that the existing firms or new firms which they propose guaranteeing, fulfil the conditions which guarantee success. If a few such enterprises prove successful it is my firm conviction that the capitalists will invest their capital willingly and continually.

The above is one of the methods by which the capital for industrial enterprises may be raised from individuals. But there is another method by which industrial enterprises can be helped with capital, viz., by creating facilities for opening accounts with banks, for the supply of the necessary funds to carry on business. If my information is correct, all the big mills carried on by European firms are indebted to some bank or other for several lakhs of rupees, and as a matter of fact no big mill can work unless there is some bank to render financial help. Those who started some industries had no such facilities and consequently had not the timely pecuniary help which is essential in every industrial enterprise. Hence the movements started have met with failure.

Government
assistance.

Q. 2.—So far as I am aware, the few industries which were started during the last few years had their capital principally supplied by the members of the legal and medical professions and some philanthropic landholders, who believe that the industrial development of the country is the best means of increasing the wealth of the nation. I am not aware of any direct financial aid of Government to any existing industrial enterprises, except the negotiation that is being carried on between us and the Bengal Government for helping our business by guaranteeing a dividend of 5 per cent. with subsequent refund to Government of the expenditure incurred, if any, in paying dividends at the guaranteed rate.

Q. 5.—As regards the different methods of giving Government aid to existing or new industries, my submission is that this will depend upon the particular requirements of each industry. Each of the methods suggested in the seven items of question 5, may prove beneficial to any particular industry and the method should be decided by Government in each individual case. So far as our industry is concerned I have already submitted that if the Government is disposed to give us a guarantee of 5 per cent. dividend for 10 years, with subsequent refund to Government of the sums advanced, if any, I think enough capital will be forthcoming and we have every reason to hope that our business, when converted into a company with limited liability and Government guarantee, will be able to declare a highly satisfactory dividend.

Of all the methods suggested in the question I think this is the most efficient and unobjectionable method, for if the condition is to refund the money advanced by Government there cannot be the slightest objection to such advances on the ground that public money should not be used for helping a certain individual or body of individuals. Each one of the method suggested in the question is effective and if any industry is in need of any particular methods of help, Government should unhesitatingly do it, for without such help the industrial development of this country at this initial stage is an impossibility.

In my opinion there should be Government control in some shape in each and every one of the methods suggested in the question. Government control in some shape is sure to prove healthy for the development of the business and it will operate as a check on maladministration and misappropriations which are likely to happen in industrial movements in their infant stage. If any business is carried on in a proper way and honestly, there need be no apprehension of any control whether it is of Government or any body with superior knowledge and experience. The gentleman representing the Government will naturally be one with industrial education and experience of business, and his control is sure to prove beneficial to any infant industry carried on by gentlemen without any industrial education or experience of business.

I think the appointment of Government Directors with defined powers for the period during which the direct assistance lasts, should be the form of this control.

Pioneer factories.

I have got no experience of a Government pioneer factory but I think it will be a wise move if Government would start a glass factory in this country. I know several endeavours were made to start a glass factory in Bengal, and a glass factory known as the Himalayan Glass Factory worked for some years, but ultimately it failed. So it seems to me that the difficulties in the way of starting a glass factory are such as our people are unable to cope with. On the other hand, the demand for glassware is so enormous

that it is highly desirable that a pioneer glass factory should be started by Government. A very large quantity of glass articles is imported to this country, and an equivalent amount of money is sent out of the country. So if a glass factory proves successful it will prove beneficial to the country in various ways. The raw materials are available in this country. I will deal later with the principal raw material for glass manufacture.

Experts in glass manufacture are not available here but it will not be difficult for Government to secure such experts from foreign countries, and if young men with scientific education are trained in the business and are taught the trade secrets, the time will come when private individuals may also start smaller factories.

At what stage should such a pioneer factory be closed or handed over to private capitalists or companies is a question which it is hard to answer now, but it will rest with the Government to adopt either of these courses when Government is satisfied that such a business can safely be entrusted to individuals who by their special knowledge and experience of such a business appear capable of managing successfully such a factory. If proper safeguards are made and adequate measures are adopted against possible failures, Government will be doing a benevolent act by handing over such successful business to private individuals or companies.

There is another industry which is at least equally important, as it concerns the daily food of the whole nation—I mean the sugar industry. Sugar is a commodity which is very largely used by almost the whole population, and although some attempts were made to start a sugar factory, so far as my information goes there is no successful factory in this country. I am aware of the Tarpur Sugar Factory and I am aware that many of my countrymen have already spent large sums of money over this business and they are even now struggling with it, but I do not know how it will succeed ultimately, unless Government is disposed to help them. Having regard to the fact that it is a commodity which is daily used by this vast population, I think Government ought to take up this industry and either start a pioneer factory, or if possible, help the Tarpur factory with such assistance as may crown the enterprise with success.

Q. 11.—As regards co-operative societies my experience is limited only to the co-operative society which we have formed in our factory and which is proving highly beneficial to our workmen. They have been saved the harassment of professional money lenders, especially the Kabuli tradesmen. They borrow money, when necessary, from the society on reasonable interest and pay off their debts by instalments in accordance with the rules of the society. Judging from experience, I think, the larger establishment of such co-operative societies will contribute towards the improvement of industrial undertakings in general. Co-operative societies.

In my opinion the commercial museum established in Calcutta has done immense good in assisting the sale of manufactured articles. It is an excellent advertiser and it affords facilities both to the sellers and buyers. So far as our business is concerned, since the museum was opened, we have received numerous enquiries regarding our manufactured articles exhibited in the museum and we have secured several customers thereby. I venture to suggest that if such commercial museums be established in every mofussil district town, at least in those towns where exhibitions are not held at all, they will prove of great benefit to the industrial movement, as they will serve as a most suitable place for the sale or display of the products of minor cottage industries. The public will be able to know what particular articles are locally produced and by whom, and thus it will encourage the producers and will give opportunity to those who are disposed to encourage indigenous industrial productions for taking up such business and if possible, starting business in a regular form Commercial museums.

The exhibitions also are of great value towards the industrial development of the country. By awarding medals and prizes and certificates the exhibitions are encouraged and the public have an idea of the articles that are locally produced. Pecuniary help from Government may not be necessary in opening such exhibitions, but the patronage of the Government, especially of the local Government officials is absolutely necessary in order to make these exhibitions successful. In every mofussil district wherever such exhibitions are held generally the officials co-operate with the organisers and the result proves satisfactory. But I think of late there has been a tendency in many exhibitions to hold amusements, such as bioscope shows, theatrical performances, *jastras* and *nautches* with a view no doubt to make the exhibitions attractive and popular. But in some cases the attention of the organisers is directed to the amusements at the expense of the exhibition and the things exhibited. Care should be taken to discourage such a tendency. Exhibitions.

Q. 37.—In my opinion, the principal Government departments should be directed to exhibit the imported articles which they use in the commercial museum, so that it will be useful to compare them with similar articles manufactured in this country when placed side by side with the imported articles. This will help the local manufacturers in improving their quality when necessary. Government patronage.

The crying need of the country is the establishment of industrial and technical schools. If India is so hopelessly backward in the industrial world, it is principally, if not wholly, due to the absence of any organisation for imparting industrial and technical education to the people of the country. All the young men study for the legal and medical professions, and, when unsuccessful, they are obliged to become clerks in offices. They have no means of acquiring an industrial and technical education. It is thus that the Bengalis are ridiculed as a "nation of clerks." Hitherto no regular systematic attempts have been made by Government to Industrial and technical schools.

impart industrial and commercial knowledge to the people of this country. As a result of the *Swadeshi* movement a national technical school was established, but as there was no Government recognition, no Government patronage, no connection with the Government, guardians naturally felt disinclined to allow their boys to join the institution. The result was inevitable and although the school exists, still in name, no practical or useful purpose is being served by it. Unless and until the parents and guardians are satisfied that their boys, when successful at such an institution, will be employed by Government, or such offices or establishments as are patronised by Government, they will not permit their boys to join the institution, however well staffed or well managed it may be. So, to my mind, it is absolutely necessary that Government should establish schools for imparting industrial and technical education and for training labour and supervision.

Q. 50.—The Department of Education with its numerous colleges and schools and institutions is already so overworked that I am afraid necessary attention will not be given to industrial and technical education, if the schools are placed under the Education Department. I think a separate Department of Industries should be established and when the Bachelor of Commerce degree is introduced in the University, a proposal for which has been set on foot, I think those qualified for such degrees from the said school should be graduated by such rules and regulations of the University to be adopted after due deliberation with competent authorities.

In my factory I have both literate and illiterate workmen and as is to be expected the former class work more efficiently than the latter. Of course, it is different in the case of workmen who derive skill by heredity. In my factory I have got a boy, who is a potter by caste aged only 9 years, who is working much more efficiently than his elders who are not potters by caste. I am introducing a night school in my factory for the improvement of the labourer's skill and efficiency, and I think night schools should be preferred to day schools for obvious reasons.

General.

Q. 110.—As I am interested in the pottery and porcelain and earthenware industry my suggestion is that there is a very wide field for business in this particular industry. The statistics of a few years will show that enormous sums of money are being drained out of this country every year by the import of porcelain and earthenware goods. Ours is the only factory in the whole of India in this line of business. We have struggled for the last sixteen years and we have satisfactorily shown that it is a profitable business, although we have gained this experience at enormous cost, as is everywhere the lot of the pioneer manufacturer. By converting our concern into a joint stock company with limited liability with the Government guarantee of a dividend of 5 per cent. the negotiation for which is going on, I hope we shall be able to satisfy our countrymen that it is possible for us to carry on business on joint stock principles even in such an entirely new industry. No doubt, my countrymen are carrying on business successfully on joint stock principles in tea and coal, but ours will prove that we are capable of achieving success even in an entirely new line. So my humble suggestion is that Government should give effect to our representation and thus encourage honest and strenuous efforts for the industrial development of the country. We get all our raw materials in this country and that is a special advantage for our business.

Q. 111.—As already stated India stands in urgent need of a glass factory. There is none in India at present and many previous endeavours have failed. So it behoves our Government to take up this industry, for which field is very wide and for which two of the essentials necessary for any industry—raw materials and market—exist in this country. As for the market, the statistical reports will show how many crores worth of glassware are being imported to this country. As for raw materials sand forms one of the principal raw materials for glass manufacture. I desire to bring to the prominent notice of the Commission the fact that we, the proprietors of the Calcutta Pottery Works, are the owners of an inexhaustible stock of quartz sand which has been declared by eminent chemical analysts after careful analysis "as pre-eminently fitted for glass manufactory." The sand is available at a place near Rajmahal, the nearest railway station being Taljhuri on the loop line, East Indian Railway, and the stock is so large that it will be sufficient for generations. The other element, labour, is no doubt a difficult matter to deal with, for this industry requires special expert knowledge and skilled labour. But if the Government will kindly take it up, there will be no difficulty in securing experts from foreign countries. The climate, no doubt, is a very serious question, but India possesses almost all the different climatic conditions of the world, so it will be necessary with the help of expert advice to select the best region for the location of the factory. I appeal to the Commission for an investigation about this quartz sand particularly, as it is useful in another trade or industry. Sand is very largely used in buildings for plastering purposes and saltpetre is the great curse of all sandplasters. This quartz sand has been declared after most careful and exhaustive examination and analysis by some of the most eminent chemical analysts in Calcutta, such as Dr. Schulten, Captain Bedford, Dr. Waldie and others, to be absolutely free from saltpetre. Besides that, it is proof against damp and requires less lime for plastering purposes than ordinary sand. This quartz sand is therefore pre-eminently suited for plastering purposes, but the railway freight has made it impossible for the proprietors to carry on trade successfully. The railway freight is so prohibitive that the proprietors have incurred heavy losses by trying to carry on this trade by rail from Taljhuri to Calcutta. If the Commission will remove this freight difficulty, a successful industry will be carried on to the benefit of all concerned.

As regards the raw materials and railway freight generally, my submission is that the Commission should take up this matter in right earnest. Almost all industries are suffering because of the prohibitive railway freight in carrying raw materials. So far as my information goes, in all civilized countries, railway authorities grant special rates to manufacturers for carrying raw materials and without that no manufacturing industry can possibly succeed. But unfortunately in this country whenever we have approached the Government with our prayer, we have the stereotyped reply, "There is the Railway Board," and that body is hard to be approached by any particular individual or manufacturer. So the attention of the Commission is particularly drawn to this question of railway freight which is proving disastrous to many industries.

ORAL EVIDENCE, 28TH NOVEMBER 1916.

Mr. C. E. Low.—*Q.* Is the Calcutta Pottery Works a limited company or a private concern?—*A.* It is a private concern belonging to myself and two others.

Q. Why did the Hon'ble Sir M. C. Nandy, Maharaja of Kasimbazaar, take an interest in it? Is he a friend of yours?—*A.* Yes. I asked him to join it and he joined.

Q. How long has your concern been working?—*A.* It began about 20 years ago.

Q. Was that before you were connected with it?—*A.* I was connected with it from the very beginning. A friend of mine discovered the kaoline clay at Rajmahal. It was about 20 years ago. I took up the idea and started in a crude form. After a few years we got hold of a Brahmin gentleman who had absolutely no special education for this industry. Still he had some ideas about it. With his help we went on for about 6 or 7 years. At that time we spent a lot of money and could not do anything. Fortunately Mr. S. Deb came in from Japan and we got hold of him, and we really began in right earnest in 1906 or 1907. Since then we have placed the entire business in his charge. We sent him again to Japan, and we brought 2 Japanese workmen. Mr. Deb was sent to Germany and we kept him there for 5 years. He came back just before the outbreak of the war.

Q. You seem to have spent a good deal of money. I hope it is realising profit?—*A.* It is realising now, and I may tell you that my last balance sheet showed a profit of 9 per cent.

Q. You wanted to open accounts with the Bank of Bengal, on the cash credit system. You were not able to do it on your partnership?—*A.* I had difficulties and that is one of my grievances.

Q. The Maharaja of Kasimbazaar could get credit anywhere. Could you as a private individual have got credit with the Bank of Bengal?—*A.* I do not know.

Q. Do you think it would be more difficult then to get money for the industrial concern under a partnership than you would as a private individual?—*A.* That is the complaint I have made.

Q. Would that same thing apply in the case of Europeans?—*A.* I cannot tell you.

Q. What is your opinion?—*A.* I think they have had these difficulties too. I am not in a position to give any concrete instance.

Q. That is your impression?—*A.* My information is that all these big mills, who are doing very lucrative business in Calcutta, have all got their accounts with the banks. That is my impression.

Q. How does it work in the case of Europeans starting a small concern under partnership?—*A.* I cannot tell you.

Q. I understand that you have now approached the Government of Bengal?—*A.* We have now found from our experience that ours is a business, in which the more is the capital invested the more will be the profit. That is why we have approached the Government of Bengal. If we get very large capital, and convert the concern into a limited one capital would come in, and a very large profit will be made.

Q. Are you prepared to submit your accounts to Government inspection?—*A.* That we have done, and they have made a report. I understand it is a fair report.

Q. Then the position is this. You have a successful concern which has been making profit for some time, which has been guaranteed by men of high reputes, but that it has been unable to go to the public, and ask them to subscribe without a guarantee?—*A.* That is my position. My reason is this. If I were to convert my firm into a limited liability company, I am afraid, private capital would not be forthcoming, because of the many failures we have recently encountered. You are aware that of late many industries were started by our countrymen but unfortunately they did not meet with success. That created suspicion and apprehension in the minds of the capitalists. That is why we approached the Government. If Government were pleased to give us a guaranteed dividend of 5 per cent. the capitalist I think would come in, and invest his money.

Q. You say that 5 per cent. should be given. Is that generally given in the market?—*A.* I have at present to satisfy the capitalist. The people are investing money in Government promissory notes. They do not get more than 3½ per cent. If they get Government guarantee at 5 per cent. that would attract capital. The Government guarantee would be a safer inducement for the capitalist.

Q. You find the investing public just as distrustful as the bank?—A. Yes.

Q. Have Government put on any expert to examine your business?—A. Yes. Messrs. Lovelock & Lewes have audited our accounts and some one having special knowledge has examined our business on behalf of Government.

Q. You have had some experience of the commercial museum and I am glad to learn that it has been of assistance to you?—A. Very much.

Q. Do you think that it should be provincialised, that is to say, there should be one here, one in United Provinces and so on. Do you think that it would give you and other manufacturing firms an opportunity of making their goods more widely known?—A. Yes.

Q. How did you get hold of employees for your factory?—A. That is Mr. Deb's look-out. He had to train them. This is the first pottery factory in India. Mr. Deb had very great difficulty in securing experts. We could secure potters. We require men with special training for the moulding business. He has taught many and now we have got a sufficiently large number who have learnt the business, and we are thinking of opening a night school in connection with our factory to get apprentices.

Q. Do the labourers stay with you for a long time or do they change very often?—A. So far as I know, there is not much change. Only one gentleman whom we taught at much expense has left us, and has joined the Gwalior factory.

Q. The labourers do not change?—A. There is no other porcelain factory in any place in India. That is the reason.

Q. Do they go away to Eastern Bengal in connection with the jute industry?—A. They do not go.

Q. From what class are the labourers drawn?—A. They come even from the Bhadrakal class. Besides there are potters.

Q. Do they come from Krishnagar?—A. Yes, and from up country also.

Q. Are your employees literate?—A. Yes.

Q. You find that a little education and some intelligence make a lot of difference?—A. Exactly.

Hon'ble Pandit M. M. Malaviya.—Q. Was it the first time that you found it necessary to go to the Bank of Bengal in this connection?—A. Yes.

Q. The solicitor who was your guarantor was not a member of your firm?—A. He is a friend.

Q. Then the bank would not advance you money on the security of your concern plus the individual responsibility of three partners of the firm?—A. Yes, although one is a Maharaja.

Q. Was the solicitor an Indian gentleman?—A. Yes.

Q. You say that so far as you are aware all the big mills carried on by European firms are indebted to some bank or other for several lakhs of rupees? That is my information.

Q. Has money been advanced so far as you are aware to European mills?—A. I cannot give you the details. I am simply informed that they have got accounts.

Q. What is the exact proposal that you have to send up to Government? Is it that they should guarantee a 5 per cent. dividend and that the money given to you by government is to be returned to them out of your profits? How would they be satisfied about the return of the money?—A. I have asked the Government to be satisfied that the money would come back, and whether we shall be able to do it or not.

Q. Merely on the ground that your business promises to be a success you have asked the Government to guarantee a dividend?—A. Yes; it may be that the Government may not have to advance any money at all when I make more profits later on. The name of the Government will be attractive.

Q. You say that there cannot be the slightest objection to such advances on the ground that public money should not be used for helping a certain individual or body of individuals? There seems to be no objection to that. Why should Government money be given to any particular individuals?—A. If I give them a guarantee that I shall pay back, then there can be no objection.

Q. In addition to that would you not give some other guarantee that the money would be refunded even if the concern is not successful?—A. That is not the proposal.

Q. You say that the crying need of the country is establishment of industrial and technical schools and you also say that you have found in your factory that those who are literate are better than those who are illiterate and that you have introduced night schools?—A. I am thinking of introducing night schools.

Q. Do you think that if the boys and girls before they went to the factory received general education they would be more efficient?—A. That is my idea.

Q. You think that there is room for developing this pottery and porcelain earthenware industry to a great extent?—A. Certainly.

Q. And you think that if Government gave some encouragement people will have confidence and the industry will develop largely?—A. That is my own idea.

Q. In regard to railway freight have you made any representation to the Railway Board?—A. I saw Mr. Dring myself. Babu B. K. Bhattacharjee.

Q. With what result?—A. He told me that they could not do more than what has been done already by the Railway Board.

Q. You have made no subsequent representation to the Railway Board?—A. No.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. When you went to the Bank of Bengal for Rs. 50,000 what securities did you offer?—A. The premises, the machinery and the plant.

Q. Suppose you wanted this money in two different names, such as yourself and the Maharaja, don't you think you would have got it instead of the solicitor?—A. I have seen their printed form. The form requires that there must be a guarantor.

Q. Can you tell us whether the other companies get their money on the raw products?—A. I have got no experience.

Q. You have sent proposals for guaranteeing 5 per cent. Have you formulated a scheme of a limited company?—A. That we have left to the projectors, who will be the managing directors. We have not now any managing director. We have simply submitted our proposals.

Q. Supposing you turn your concern into a limited company with a big capital, you must have a prospectus?—A. That would be later on when we get Government assurance.

Q. Don't you think that before sending up the thing to Government you must have a prospectus?—A. We have not yet come to that.

Q. If you can show to the public that you can make 9 per cent. profit and supposing you have a moderate commission and if no royalties are charged, do you not think that the public would come in?—A. No. That is my impression.

Q. Have not the jute mills a lot of Bengali capital?—A. That is because that they are managed by firms who are sure to make profits.

Q. Because they are managed by Europeans?—A. Exactly. That is why they have got confidence.

WITNESS No. 87.

BABU RAJANI KANTO BHATTACHARJEE, *Pleader, Director, representing the Rangpur Tobacco Company, Limited, Bengal.*

WRITTEN EVIDENCE.

I raised capital for the Rangpur Tobacco Company, Limited, a concern which manufactures cigarettes, snuff, plug tobacco, mixtures, etc.

My difficulties in raising capital were chiefly :—

- (a) Want of confidence in the business capacities of the promoters.
- (b) Doubt as to the ultimate success of the venture.
- (c) Indifference of landholders, traders, shop-keepers in short wealthy people in general.
- (d) Apprehension on the part of some zemindars and Government servants of incurring the displeasure of Government by subscribing to capital of the company.
- (e) Comparative poverty of those who were willing to assist the enterprise by subscribing to its capital.

These difficulties I think will be removed by direct Government connection in one or more of the ways indicated in question 5.

In my experience the following are the sources from which capital for industrial enterprises is principally drawn :—

- (a) People following the learned professions, i.e., legal and medical.
- (b) Service holders.
- (c) Government pensioners.
- (d) Poor educated middle class gentlemen.

I am of opinion that, except money grants-in-aid, the forms of assistance indicated Government assistance in question 5, either singly or in combination, according to the necessities of each individual enterprise, should be given and in each case there should be Government control in the ways as noted below :—

- (i) Government experts, or Director of Industries appointed by Government, or his assistants, or some local executive officers of Government, should be appointed extraordinary directors with defined powers of supervision, direction and advice.

- (ii) A Government auditor should be appointed for periodical auditing of accounts.

I think Government should, in the first place, make a general survey of the Pioneer factories, manufactured articles imported into the country and start pioneer factories at suitable places

for the manufacture of those for which local produce can be utilized. These pioneer factories should, after they have proved successful, be handed over to private capitalists or companies on their guaranteeing to work them for the purpose the Government originally had in view.

I do not approve of the conversion of successful pioneering experiments into permanent Government enterprises.

Financing agencies. In my experience all new industrial ventures are hampered by the conditions under which they are at present financed. I know specially of one case, the Rangpur Tobacco Company, Limited, which the local banks and some of the Calcutta banks declined to finance and I had to start a new bank for financing this concern, and this also has declined to give it further financial assistance. I think it is not possible to give more financial assistance to industrial ventures by existing banking agencies. New banking agencies, I think, should be started with the direct object of helping industrial ventures.

Limits of Government assistance. Government assistance should be limited to the utilization of local produce and its improvement by manufacturing it into finished products in places—

- (a) where there is no such manufacture, or
- (b) where there is such a factory but it has not been successful and there is a reasonable chance of its being successful.

I think there should be no limitation on Government aid to a new enterprise if it competes with an established external trade.

Technical aid. I do not think the loan of Government experts to private firms or companies would be of much use.

Research abroad. I think there should be a Research Institute in India centrally situated for the present. Gradually it will be necessary to have a Research Institute in every important province. In addition to this, provision should also be made for research in special subjects. I think research in England in addition to research in India, would be advantageous because there will be more scientific men available in England and because the scientific men there are more in touch with modern scientific investigations all over the world.

I do not think the Advisory Council for Research in the United Kingdom can give much assistance to Indian industries because conditions climatic or otherwise greatly differ.

I do not think any college in India has such modern scientific and chemical laboratories as will enable it to carry on the research investigations necessary for the solution of industrial problems.

Surveys for industrial purposes. I think the existing knowledge of the available resources of the country require to be supplemented by further survey and it should be carried on by a Department of Industries specially created. Its object should be to assist people willing to start industrial ventures or to supply information to Government for starting pioneer industries.

Commercial museums. The commercial museum in Calcutta is a useful institution. I think it should be further developed and gradually others instituted, one being situated at the headquarters of each district, if possible. In my experience and opinion there is a great need of sales agencies or commercial emporia for the sale as well as the display of the products of minor and unorganised cottage industries. In my opinion there should be in each presidency town an agency under Government control and guarantee.

Exhibitions. Industrial exhibitions are very valuable inasmuch as they disseminate the knowledge of industrial products, their sources of manufacture, stimulate a desire for starting industries and help in advertising. I think Government should take measures to hold or encourage such exhibitions. For some time to come Government should itself hold such exhibitions and recoup itself by fees from visitors: but afterwards, Government may encourage these exhibitions by indirect support.

In these exhibitions all industrial products as well as agricultural, mineral and other products which are closely connected with industries should be exhibited. But to make them attractive other means may be adopted.

Trade representatives. Trade representatives should, in my opinion, be appointed in Great Britain, the Colonies, and other countries to represent the whole of India. They should be respectable firms and their duties should be to supply on requisition information as to prices and demands of Indian products or to procure selling agencies if required on such terms as may be agreed upon.

I do not think Indian provinces require any trade representatives being appointed in other provinces. The Director of Industries in each province may give such help as may be necessary.

Government patronage. Government departments which use imported articles should publish lists of these articles and also exhibit them in commercial museums. I think Government should publish lists of its requirements and try in the first place to have them supplied by local manufacturers. This should be made compulsory.

Banking facilities. More banking facilities are necessary for marketing indigenous products. The existing banking agencies are unsatisfactory. Central co-operative credit societies may be utilised or other banking facilities offered.

Land policy. I think Government should give more concessions of land for starting new industries. The Land Acquisition Act requires amendment to give more facilities for the acquisition of

lands for industrial enterprises. At present it is discretionary. In every case of a *bond fide* application for the legitimate requirements of a new or existing industry Government should acquire lands on previous deposit of the costs.

I had to train up apprentices in the factory of the Rangpur Tobacco Company, Ltd. I had to train up machine men and other labourers.

No provincial organisation exists in my province for the development of industries.

I recommend the following organisations for the future development of industries in our provinces.

A Board of Industries presided over by the Director of Industries should be created. It should consist of men capable of assisting industrial ventures, and some experts. The Board of Industries should have executive powers with budgetted funds. It should give help and advice when asked for by industrial concerns, should help these concerns in technical matters, and should start pioneer industries and help in starting new industries. The Director of Industries should be a business man and should have experts as his assistants. The Director should be the President of the Board of Industries and should have a separate department of Government. I recommend the formation of an Imperial Department of Industries which will have general powers of supervision and control over the Provincial Boards.

I know of no organisation of technical and scientific departments at work in my province for the assistance of industries. In order to aid industrial development I recommend the formation of new imperial scientific and technical departments. As for the subjects, that would depend upon the result of the survey of the imports as recommended in the previous part of the statement.

Lack of transport facilities by rail and water do hinder industrial development in my province. Railways or steamer companies do not give any preference to industrial products, even when perishable and the result is total loss of consignments at times. I know of many instances of this kind in connection with the Rangpur Tobacco Company, Ltd. I would recommend the insertion of special provisions in the Indian Railways Act and also in rules and regulations governing railway administration and steamer services requiring them to take special care of industrial manufactures and give special facilities for the despatch of industrial products.

Railway freights are too heavy, nay, prohibitive. I would recommend reduction of railway freight for *bond fide* industrial products.

I know of one instance in connection with the Bengal Forest Department. We required strong wood for caddy boxes for plug tobacco and we asked for the assistance of the Department of Land Records and Agriculture but I am sorry the Forest Department did not help us in the matter.

I have been actively concerned in the tobacco industry. I would like to make the following suggestions for its development:—

- (a) Trained experts capable of manufacturing plug tobacco, tobacco mixtures, and other tobacco products should be brought out and lent to those requiring their services.
- (b) A department of the Scientific Research Institute should be devoted to the scientific treatment of tobacco with a view to help its manufacture.
- (c) Appointment of trade representatives in foreign countries for the introduction and sale of Indian tobacco.

India seems peculiarly suited for the following industries, on account of its resources, labour and market:—

1. Sugar; 2. Paper; 3. Matches; 4. Metals; 5. Chemicals; 6. Dyeing; 7. Glass; 8. Tanning; 9. Tobacco; 10. Jute; and 11. Machinery.

ORAL EVIDENCE, 29TH NOVEMBER 1916.

Mr. C. E. Low.—Q. You represent the Rangpur Tobacco Factory?—A. Yes.

Q. What is your capital?—A. Originally we had Rs1,00,000 and subsequently it was raised to Rs2,50,000, but the whole amount of this has not been subscribed. Rs10,000 or Rs15,000 was subscribed.

Q. It has ceased working?—A. No. It is working since 1909. It is a limited company.

Q. Rangpur produces particularly good tobacco?—A. Yes.

Q. You have a Government farm at Rangpur devoted to the cultivation and curing of tobacco?—A. There are three farms. We grow tobacco of various kinds and it was found to be in no way inferior to the best tobacco grown elsewhere.

Q. Did you grow any tobacco yourself?—A. Myself, i.e., our company. I also grew tobacco in our compound but not on a large scale.

Q. Were any Government farms working while your company was in operation?—A. Yes.

Q. Did you get assistance from them?—A. We purchased tobacco from them, if I remember, twice, but not more than that, as the price was too high for us.

Q. But did you get any help in experimental questions, such as in curing tobacco? Did you cure your tobacco or get it ready cured?—A. We cure the tobacco grown in our compound. We purchase tobacco generally from the cultivators.

Q. When was the Monghyr factory started?—A. I cannot give you the exact year.

Q. Did it start after you started?—A. About three or four years before we started on a very large scale.

Q. They purchased tobacco in your district?—A. Yes, so much so that practically the price of tobacco which was about Rs or Rs-8-0 before went up to Rs or Rs9, because they began purchasing on a large scale.

Q. You make several brands of cigarettes?—A. Yes.

Q. The Monghyr factory sell these cheaper?—A. They sometimes sell cheaper and sometimes not. But they have got this superiority over us that practically all the big sellers are under their employ, because they pay a large commission, and the whole of the market practically is their monopoly.

Q. You do not pay even the same rate of commission?—A. No.

Q. Did you have any agent in Rangpur town?—Q. Yes.

Q. Outside the district, in Bogra?—A. Not only in Bogra but in other districts. We tried to open one at Cooch Behar and other districts but the result was not successful.

Q. Did you bring tobacco by cart or by railway?—A. So far as the tobacco bought in the district was concerned, we brought it in carts, but the tobacco we bought in Calcutta had to be taken by railway.

Q. What did your expert staff consist of?—A. We had at first a Parsee gentleman. Then we had a Bengali gentleman, and then we had an Eurasian and then an European gentleman. But they all proved to be unsatisfactory.

Q. Had these men any training or were they business managers?—A. The Parsee gentleman had training in his own factory at Bombay, in the cigarette factory. The others, of course, had training in the different factories here in India, i.e., in cigarette factories.

Q. You use machinery?—A. Yes. &

Q. Where did you get it from?—A. We purchased some of our machinery from a Bombay factory and some from Germany through an English agency. The cigarette machines are all German machines.

Q. You bought second-hand?—A. Two were bought second-hand and one we bought direct.

Q. What local banking facilities are there in Rangpur?—A. There are three banks in Rangpur, but two of them did not give us any help. We started a new bank that gave us some help. It advanced money and issued cheques and so forth, but later it declined to give any financial assistance.

Q. It gave you money for working capital?—A. Also for purchasing machinery. For the third cigarette machine we had to purchase, we borrowed.

Q. What security did you give?—A. The whole concern,—the land, buildings and machinery. The whole block.

Q. You say you were troubled by unsuitable railway rates. Can you remember any particular instances?—A. I remember more than one instance in which owing to these difficulties we had lost the whole of the consignments. I remember two or three instances in which consignments of cigarettes sent to Calcutta took over a month to reach Calcutta and the result was that the whole of the consignment was spoiled.

Q. You did not pack them in tin-lined boxes?—A. No. It ought not to have taken more than five or six days.

Q. At the Monghyr factory they are packed in tin-lined boxes?—A. Yes.

Q. What did you want the Forest Department to do for you by way of finding wood for boxes?—A. We have machinery for the manufacture of stick tobacco. But for packing these tobaccos we require caddy boxes but we could not get any wood here.

Q. Did they give you any information at all, or did the information they gave prove unsuitable?—A. We tried our very best to get information from the Forest Department at Darjeeling. They gave some wood but it did not prove successful. Then we applied to the Director of Land Records and he introduced us to some officer in Dehra Dun and he simply wrote a letter and did nothing else. For want of good wood our machinery is lying idle.

Q. You suggest the appointment of trade representatives abroad for the popularisation of Indian manufactured tobacco?—A. Both manufactured and unmanufactured.

Q. Do you think it will be desirable to stimulate the export of unmanufactured tobacco?—A. Yes.

Q. You think that even if the full quantity is exported there will be plenty for Indian manufactures?—A. Yes.

Q. You think there will be a market abroad for the better grades of Indian grown tobacco and Indian manufactures?—A. It is practically in the hands of a few purchasers who can dictate their own terms.

Q. And the ryot therefore does not get a good price?—*A.* Yes.

Hon'ble Pandit M. M. Malaviya.—*Q.* When did you start this company?—*A.* It was registered in 1908 and the work practically started in May 1909.

Q. And when did it begin to pay?—*A.* It paid a small dividend only once. It is still working, but not at a profit. We are working still at a loss.

Q. Can you tell us the reason why it has not paid? Have you suffered by competition with anybody?—*A.* Suffered by competition. The capital was short and we did not get a good expert.

Q. What competition did you suffer from?—*A.* Competition with rival manufacturers. In Calcutta, we had the East India Cigarette Factory and at Monghyr we had the British Indian Tobacco Company which is now called the Imperial Tobacco Company.

Q. Is that not an American concern?—*A.* That was originally an American concern, but it was purchased by a British concern, and it is now also a British concern.

Q. Among the difficulties in raising capital, you mention an "Apprehension on the part of some zemindars and Government servants of incurring the displeasure of Government by subscribing to the capital of the company." Will you explain what you mean?—*A.* At the time when we started our factory there was the Swadeshi agitation and our difficulty was that some people were afraid to subscribe to the capital.

Q. That was only a temporary phase at the time?—*A.* My answer is limited to that.

Q. Afterwards things changed in 1908?—*A.* What would be the position now I cannot say.

Q. You say that you tried the local banks and Calcutta banks and they declined to finance you. Can you disclose the names of the banks?—*A.* The Bengal National Bank and the Hindustan Co-operative Bank.

Q. Then you started a new bank of your own?—*A.* Yes.

Q. You think that there should be an industrial bank which should finance industries?—*A.* Not one, but if possible more than one.

Q. One at least in every province?—*A.* One in each province with branches in different centres.

Q. You say, "I do not think any college in India has such modern scientific and chemical laboratories as will enable it to carry on the research investigations necessary for the solution of industrial problems?"—*A.* Yes.

Q. You think there should be a well-equipped college for this province?—*A.* At present we cannot get any assistance whatever, no scientific help. They ought to be not only better equipped but they should be designed for this very purpose.

Q. You mean better equipped to deal with industrial problems?—*A.* Yes.

Q. You say that you want a Research Institute for India, a Central Research Institute?—*A.* At present.

Q. And you also say that you would recommend the formation of new imperial scientific and technical departments?—*A.* Yes.

Q. Do you not think that a Central Research Institute would be sufficient for your purpose? You want the scientific and technical department to be independent of the research institute?—*A.* It may be closely connected. What we want is this, that there should be a research institute for the purpose of solution of industrial problems and unless there is a department of Government I do not think the matter can be satisfactorily done.

Q. You want this department to be separate and in addition to the research institute?—*A.* Yes.

Mr. C. E. Low.—*Q.* I thought you said that your company had ceased working.—*A.* No. It is still working, but not at a profit.

Q. Does the Monghyr factory make only cigarettes or does it make tobacco?—*A.* They make cigarettes, they make mixture and they make plug tobacco too.

Hon'ble Sir F. H. Stewart.—*Q.* You think that the difficulties you met with may be removed by direct Government help. Even Government help could not solve the difficulty relating to want of confidence in the business capacities of the promoters?—*A.* To a considerable extent if Government help is guaranteed we can get competent business men.

Q. You want Government to do everything then?—*A.* No. To help us in procuring experts, raising capital, etc. For instance we did our very best to get better experts but we could not.

Q. If Government helps you would it become a paying proposition though it was not found to be a sound business proposition to start with?—*A.* When Government help is assured, we would be able to get better experts, better people to manage, and sufficient capital.

Q. The new bank which you started to finance your company is it still working?—*A.* Yes.

Q. Is it successful?—*A.* Yes.

Q. But it did not think highly enough of the prospects of the Tobacco Company to go on financing it?—A. It cannot go on financing indefinitely a concern which has not proved successful.

Q. Is it a local bank?—A. Yes. It is situated in Rangpur.

Q. What is the bulk of its business?—A. Its registered capital is Rs. 2½ lakhs and it has got deposits. It advances money to different people on mortgages of lands and on hand notes and securities of that description.

Q. And it is working at a profit?—A. Yes.

Q. The capital of your Tobacco Company was increased from 1 to 2½ lakhs?—A. Yes. Only about Rs. 10,000 or Rs. 15,000 out of the increased capital was paid up. It was originally registered with a capital of 1 lakh. It was subscribed fully. Then it was found to be insufficient and the capital was raised to 2½ lakhs.

Q. And of that you managed to collect only Rs. 10,000 to Rs. 15,000?—A. Yes.

Q. That was the chief cause of your failure, that you could not get money?—A. Not only that. The chief cause was the shortness of money as well as competition. The East India Cigarette Company began to undersell and in some places the British Indian Tobacco company also began to undersell us.

Q. Is the East India Cigarette Company an Indian concern?—A. That may be called an Indian concern. Its largest shareholder is a Turkish gentleman. He had his factory at Hong Kong. He removed his business here to Bengal and made it a joint stock company and he of course took the largest share.

Q. Did they have a factory in your district?—A. No. They had a selling agency in Rangpur, who undersold us.

Q. They could undersell you with cigarettes manufactured in Hong Kong?—A. They now manufacture cigarettes here in Calcutta. The whole concern was transferred to Calcutta.

Q. Then you say you had to train up apprentices, machine men and labourers. You had no skilled labourers? You had to train these men?—A. When we originally started the company we brought some work people and machine men from Bombay and with their assistance we trained the local people here.

Q. You say you once managed to work at a profit. Was it for a year or half a year?—A. One year.

Q. At what stage was that? Fairly early?—A. During the third year from the year of registration of the company.

Q. And it was after that you began to feel the stress of competition?—A. Yes.

Q. At that time you thought you had got over your initial difficulties and saw prospects of success?—A. Yes, but then this competition became keener.

Q. And to meet the stress of competition you had to try to expand your business?—A. Yes. We purchased a new machine at a cost of Rs. 13,000. That was, of course, a German machine. That too did not help us.

Hon'ble Sir Fazulbhoj Currimbhoy.—Q. Were you the chief promoter of this Company?—A. Yes. May be said so.

Q. You started it during the swadeshi movement?—A. Yes.

Q. And how did you think of tobacco business? Had you had any experience before?—A. I had been dealing in tobacco for some time before this.

Q. In what way?—A. Purchasing tobacco and curing tobacco for the manufacture of cigars and so forth, and at our instance the Agricultural Association was started and at our instance the Government acquired lands and we paid money, and at our instance the Government acquired lands for the demonstration farm. There are experiments made there in the cultivation of tobacco.

Q. Did you calculate on American competition?—A. Yes, but we now see our calculations are incorrect.

Q. They can stand to make a loss while you cannot?—A. Yes.

Q. At what price do you sell 100 cigarettes?—A. We sell by thousands. The machine made cigarettes are sold by thousands. During the year we worked at a profit, we sold the lowest grade cigarettes at Rs. 2-6-0 to Rs. 2-8-0 per 1,000, but in consequence of competition we had to reduce it to Rs. 1-4-0.

Q. And American cigarettes are sold here?—A. They have got various brands. They sell the same quality of cigarette that we sell at Rs. 1-4-0, at Rs. 2-10-0.

Q. They have got a still lower quality to compete with you?—A. I know they have got cigarettes which they sell at annas fifteen. These cigarettes have to be sold through agencies. They are big sellers in Calcutta and other centres. All these people are under contract with the American Tobacco Company. They pay a large commission and unless you approach these people you cannot go on selling in retail. We could not sell through these people as we could not afford to pay that commission. When we started the factory we began purchasing tobacco at Rs. 3-8-0, but the British American Tobacco Company began making large purchases and the result was that the price of tobacco leaves went from Rs. 3 to Rs. 9.

Q. You say you bought some machinery from Bombay?—A. Yes. From Messrs. Warden & Co.

Q. They had their own factory?—A. Yes.

Q. And they rejected that machinery because it was not paying to them, and you took it over?—A. Whether they were losing I cannot exactly say.

Q. This machinery they rejected?—A. I do not know. We had it inspected by Mr. P. N. Bose, our director.

Q. Was he an expert in tobacco machinery?—A. We had our own engineer and he said it was all right. Then we purchased new machinery too. We purchased stock and other things also.

Q. Then you say, "Government experts or Director of Industries appointed by the Government, or his assistants, or some local executive officers of Government should be appointed extraordinary directors with defined powers of supervision, direction and advice." Do you want experts or non-experts as directors?—A. I want experts.

Q. Do you think that a small company can afford to have an expert as director?—A. In case it is not possible, a local officer may be appointed.

Q. About your bank, you say you started the bank to finance your own concern. Do you owe the bank any money?—A. The company owes to the bank about Rs. 80,000. It is still unpaid.

Q. And therefore they cannot advance more?—A. No. They have given the amount on machinery and everything, on the mortgage of the whole concern.

Q. What are they now doing? They lend money like sowcars?—A. They advance money not only to this concern but to other people also.

Q. Financing trade or lending money to sowcars?—A. They lend money to zemindars, traders, merchants.

Q. Just like sowcars?—A. Yes.

Q. You say that trade representatives should be respectable firms?—A. Registered firms.

Q. Where registered?—A. May be registered anywhere, in England or India.

Q. Suppose there is a firm in Italy. In what way can they be of assistance to you to promote Indian trade?—A. You know what is called Bengal ginger, which is nothing but ginger grown in Rangpur. Nowhere else in Bengal is ginger grown. The Madras ginger is better. Through the Department of Agriculture we grew that quality of ginger in Rangpur. It grew well. After examination of some papers I found that Bengal ginger was selling at a lower price than Sumatra and other gingers. I sent two consignments of ginger to England direct for sale, and the result was that I lost the whole money, and unless you get a respectable firm, registered or unregistered—registered would be better you cannot sell your agricultural products directly in foreign countries.

Q. We have got British Embassies and consuls at every important place, and don't you think it would be better if you got an Indian representative attached to the Consulate?—A. That will do. I doubt whether Government will do it.

Q. They have got commercial attachés too?—A. I doubt whether they will undertake this sort of duty.

Q. Are you training up any apprentices in your factory?—A. At present, not.

Q. You state that the Board of Industries should have executive powers over budgetted funds?—A. My idea is that Government should give financial help to industrial ventures and for the purpose of ascertaining whether a particular venture will be successful or not, to give sound advice, I propose that method.

Q. There should be some fund specially set apart for helping industries every year?—A. Yes.

Q. Have you any railway freight difficulties relating to tobacco?—A. Ordinarily railway freight is very high.

Q. Mr. A. Chatterton.—Is the Rangpur Tobacco Company a public registered company?—A. Yes.

Q. Have you published balance sheets from time to time?—A. We have been publishing balance sheets every year. I shall send to the Commission a copy of the balance sheet of every year.

Q. You have three cigarette machines?—A. Yes.

Q. What else have you got?—A. We have got tobacco cutting machines, snuff machines, plug tobacco making machines, tin cutting machine, etc.

Q. Have you any machinery for making cases, for packing?—A. No. We pack by hand.

Q. Are the packages you make by hand as nice as the machine made ones of the Monghyr factory?—A. In packing there is very little difference.

Q. You mean that your packing is just as good as the other?—A. Yes.

Q. You started this company without any experience of the business, with a second-hand machine?—A. I saw cigarette making.

Mr. B. M. Das.

Q. Would you mind telling us what your annual turnover of cigarettes is?—A. So far as our machinery is concerned we can manufacture about four lakhs a day, but do not manufacture so much, because we cannot find buyers of the whole daily outturn. That was our initial difficulty. The whole trade is practically in the monopoly of the big concern named before.

Q. You say you are working this factory at a loss?—A. Yes.

Q. How much loss?—A. It is not possible to give it. We have reduced our establishments and the loss for the last two years has been not more than Rs. 3,000 a year. On the whole we have lost about Rs. 75,000 to Rs. 80,000.

Q. Practically the whole of your capital is gone?—A. Yes.

Q. Have you mortgages on your block?—A. It is mortgaged to the bank.

WITNESS No. 88.

MR. B. M. DAS, *Manager, National Tannery, Calcutta.*

WRITTEN EVIDENCE.

Capital.

Money can hardly be called scarce in Bengal. There is a tendency to invest it in land, middleman's trade and in money-lending business. But when wanted for manufacturing industries capital is more or less shy, because investments in many of them are not yet considered safe. Industrial enterprise and investing spirit are however not altogether lacking, as is evidenced by the fact that the industries which have succeeded in convincing the people of their profits have not failed to attract capital.

The Bengal Chemical and Pharmaceutical Works Limited of Calcutta, the tea industries of Jalpaiguri and Darjeeling, the collieries of Jheria and Ranigunj may be cited as instances to this point.

In some of the most profitable industries there seems to be already over-capitalisation. Notable amongst them are the oil mills in Calcutta. They have in fact to work short time.

The first thing therefore for a proposed industry to get capital is to inspire faith and to carry the conviction of its economic soundness to the public. Once the ice is broken the wealth of the country will easily flow in industrial channels.

One way to do it is to start an industry, whenever possible, on a small scale and by its work convince the public of its soundness and possibilities. Working facts and figures showing the profits actually made are far more convincing than mere prospectuses.

Such small industrial concerns are to be started either by private enterprise and capital, or in case that be not forthcoming should be pioneered by the Government.

Happily in Calcutta a few industries have already been pioneered in this way by private enterprise.

The Bengal Chemical and Pharmaceutical Works which is now a limited liability company was started on a very modest scale, worked patiently for quite a long time and when the promoters were satisfied as to its economic soundness it was made into a limited company and shares were sold to the public quite easily.

The Calcutta Pottery Works which is still a private concern had a very modest beginning and by its patient work of a decade has convinced many of its possibilities.

The National Tannery belonging to the Hon'ble Dr. Nilratan Sircar is another instance to the point. It was started at first on a very small scale. It has worked patiently for 10 years extending its works and expanding the business every year. The accumulated experience and mass of working figures would leave no doubt even in the most pessimistic minds that there is money in chrome tanning.

These small concerns have indeed done immense good to the country—so far as pioneering goes. Their growth, however, is hampered by the way in which they are financed. The private capital with which they were started must of course be limited and is quite unable to cope with growing business. Sometimes it has been the case that a factory has been built and machinery installed but has not been able to work for a long time for want of working capital. More often for want of liquid money some concerns cannot make their purchases at the cheapest market or in the proper season.

These handicaps could be removed if the Government would come forward with money facilities in some shape or other. In my opinion giving proper banking facilities by starting industrial banks would solve the problem in the most satisfactory way.

Supply by Government of machinery and plant on hire purchase system would also help the growth of many struggling concerns.

Some proprietors may be willing to convert their proprietary concerns into limited companies. In such cases the Government may help a great deal in inspiring confidence in the minds of the investing public either by subscribing a part of the capital or by guaranteeing a dividend for a period. It is a well-known fact that the people of this country have got

more faith in the Government than in private individuals or companies and would willingly invest in concerns in which Government is interested.

In companies in which the Government holds shares or guarantees dividends it should have one or more representatives in the directorate. The number of Government directors should be in proportion to the Government investment. Accounts should also be checked periodically by Government auditors.

As soon as the concern will have sufficient capital and be on a dividend-paying footing and the Government is convinced that the concern no longer needs its association, the Government should withdraw by selling its shares to the public and should apply its funds to help or pioneer some other industries that might be in need of them.

There are some industries which cannot be started on a small scale and are hence beyond the capacity of private individuals. These industries should be pioneered by Government. The following are a few instances of the type.

An attempt should be made to distil the tar and produce some of the more important intermediate products at least instead of running the entire quantity to waste. The coal tar industry.

Carbonate of soda and potash, caustic soda and potash are most important chemicals for many industries, such as soap, paper pulp, etc. They are also required for the manufacture of other chemicals which find use in industries. For instance chrome tanners require bichromate of potash. We have got chromite in India but to make bichromate from it we want cheap potash. The alkali industry.

The Forest Department of the Government may profitably pioneer the manufacture of tannin extracts from the known tanning materials.

Instances are not wanting in India to show how Government pioneering has produced excellent results.

The Indian tea industry owes its origin, popularity, and prosperity to Government help and pioneering. The Government of India had to undergo a lot of expenditure (according to Watt's estimate about £72,000) to introduce tea plantation in India and when the condition of the tea industry was prosperous and did not require any Government help, it was handed over to private enterprise.

The development of the leather and leather goods making industry of Cawnpur and Agra is due mainly to Government encouragement.

The fruitful results of Mr. Chatterton's pioneering of chrome tanning under the auspices of the Government of Madras are to be seen in the chrome tanneries started in Bangalore, Calcutta, Cuttack, Berhampore, Allahabad, and Rewah. Besides these recognised tanneries working on factory scale there are many private individuals who are tanning sheep and goat skins by chrome process on a small scale and are making a living out of it. Indeed these individuals would be benefited a great deal if they receive help from the Government to get machinery. These are earnest men and should be encouraged on all possible ways.

Next to capital expert knowledge is the most essential thing for an industry.

Technical aid.

A step in the right direction was taken when the Association for the Advancement and Cultivation of Science and Industry in Bengal undertook to send abroad a number of young men for industrial training. The Government of India and the University of Calcutta also award scholarships for the industrial training in foreign countries.

The number as well as the period of the Government technical scholarships should however be increased. Three years, for which at present the scholarships are made tenable, are not sufficient for thorough study of an industry and should hence be extended to at least five years.

The Home Government as well as the British Embassies in other countries should try to secure for the candidates facilities to get practical experience in factories.

Payment of premium sometimes facilitates a candidate's admission into a factory as apprentice. In such cases the Government should pay the premium. I had to pay 500 francs for 3 months' apprenticeship in a tannery in Italy. The University of Calcutta very kindly granted me the sum.

In selecting candidates for training as experts of a certain industry stress should be laid not only on their scientific attainments but also on their experience of the industry as it exists in the country. For industries that are to be started *de novo* this is not possible, but for existing industries instead of sending brand new men both the Government and private Associations should make it a point to send the managers or experts of existing concerns who have already got some working experience in order that they may add to their knowledge and solve various difficulties which they have met with in their practical work.

In the past selection of candidates for these scholarships was not very happy. Mediocre men having no special industrial aptitude returning from foreign countries with indifferent technical training caused some disappointment on a few occasions.

If these experts are the direct cause of some failures the authorities who were responsible for the selection are also to be blamed. Failures have also been due sometimes to want of forethought on the part of capitalists who often started industries under the impulse of

Swadeshi enthusiasm and did not adequately consider the various factors essential for the success of an industrial undertaking.

Technological institutions.

Training of experts by sending men to foreign countries is very expensive. Besides everybody can't have the good fortune of securing an industrial scholarship and there may be many who have nevertheless an aptitude, inclination and necessary qualification for industrial training, but for want of proper facilities are drifted to other walks of life.

For this reason technological institutions for training of experts locally should be started in different provinces just as there are Medical, Engineering and Agricultural Colleges in the various important provinces of India.

In these institutes different technological subjects should be taught and in selecting subjects for a provincial technological institute special stress should be laid upon the subjects for which the province is specially suited.

In this matter one may follow the lines on which the British and Continental technological institutes were started.

Thus Leeds and London being the chief tanning centres special stress has been laid upon tanning at those places and the leather industries department of the Leeds University and the Leather Sellers' Technical College in London were opened.

On the same principle were started the "Gerberei Technische Hoch Schule" in Freiburg, Germany, the Gerberei Technische Untersuchungsanstalt in Vienna, and the tanning schools in Italy and France.

In dyeing, engineering and mining we find the same principle applied in every country.

A technological institute ought to be started in Calcutta in which among other subjects special importance should be attached to the teaching of leather manufacture, for hides and skins are one of the most important raw materials of Bengal.

Staff.

The constitution of the teaching staff of a department of a technological institute may be best explained by taking a concrete example. In the leather industries department, for instance, there should be a chair of technology of leather manufacture. The incumbent of this post should be a man of either European or American reputation. I mean men of the stamp of Professor Procter of the Leeds University, or Dr. Gordon Parker of London Leather Sellers' College, or Professor Meunier of France, Professors Schorlemmer and Becker of Germany or Professor Eitener of Vienna. He may be called the Director of the department and should be assisted by—

- (1) One chemist and two demonstrators to help him in the chemical investigations bearing on leather industry. The chemist should be a Bengali with European qualifications. The demonstrators should be appointed from the advanced students of the department.
- (2) Two practical tanners, one of whom should be an expert in heavy leather manufacture and the other in light and chrome leather making. These experts should be thoroughly experienced men and be preferably liberal-minded Europeans or Americans.

Courses of instructions.

There should be three courses of instruction,—

- (1) Advanced.
- (2) Intermediate.
- (3) Elementary.

Advanced course.

To this only science graduates, B.Sc.s and M.Sc.s will be admitted. They will receive such instructions in the higher technology of leather manufacture as will enable them to carry on scientific investigations connected with the industry. Some of the Government industrial scholars should be selected from these advanced students and sent abroad to supplement their knowledge and get foreign experience. But before leaving this country they should get themselves apprenticed for some time in a local tannery and study the existing conditions.

Intermediate course.

This course is meant for foremen and supervisors. To this will be admitted young matriculates and also others who having received some school education had joined a tannery and have had practical experience in leather manufacture. They will first be taught elementary chemistry, both theoretical and analytical, and afterwards the applied chemistry of leather manufacture. Equipped with this training they will be in a better position to control the different processes involved in the manufacture of leather.

Elementary course.

This is meant chiefly for the skilled workmen and will consist in practical demonstration of the various mechanical and hand operations required in leather manufacture.

This class be better held at night so that workmen may attend after factory hours. The demonstrations will have to be explained in the provincial vernacular.

Demonstration factory.

A demonstration factory, that is a tannery in miniature equipped with all up-to-date machinery should be attached to the department. I should think that the installation of machinery won't be a costly affair, because the machine manufacturers would in many cases be too willing to send one or more of their machines to the department for exhibition and advertisement. This in fact has been the case in the leather industries department at Leeds.

A small plant for making tannin extracts and a glue boiler should also find place in the demonstration factory.

In the demonstration factory practical tanning experiments should be carried out to manufacture new kinds of leather not yet produced in the country, for instance enamelled horse hides for motor car cushions, chrome patent leather, leathers for pickers and picking bands for the cotton and the jute mills. When the processes for manufacturing these leathers are successful, they should be made known to the public and after showing their commercial possibilities tanners should be induced to undertake these new lines of manufacture. Practical trade investigation.

The tanning experts should pay periodical visits to the local tanneries, see the processes used and suggest improvements, and by practical demonstrations convince the country tanners of the advantages of improved methods.

The small country tanners may not come to the leather industries department, but the experts, working as it were, like industrial missionaries should go to the tanners with a view to ameliorate the condition of the tanning industry. It may be a case of mountains going to Mahomet but it should be done to produce results.

Knowledge is to be conveyed and thrust upon the Indian artisan and craftsman so that he may wake up, wonder and finally adopt improved methods.

If organised concerns, tanneries or otherwise, want the services of Government experts or chemists, they may have them on the payment of some fees depending on the duration and importance of the work they will be asked to do. If adequate fees are paid by private concerns the results of the investigations should not be made public.

There should be two laboratories attached to the department, (1) General Laboratory and Laboratories. (2) Research Laboratory.

General Laboratory.—In this students will work.

Research Laboratory.—In this analyses and tests for the trade will be done and higher scientific problems bearing on the industry should be investigated by research scholars and chemists under the guidance of the director. Subjects, such for instance a thorough investigation of the tanning materials available in Bengal with respect to their tannin contents, tanning properties, commercial possibility of making extracts out of them, etc., may be profitably undertaken.

Various other scientific problems connected with leather industry which have not yet been solved by the leather trades chemists may be investigated.

In the technological institute there should be a good library having the standard books of reference on pure and applied sciences. Trade journals and scientific periodicals in English, French and German should be subscribed. Technological library.

Attached to the department there should be a museum containing samples of raw materials and the best samples of finished articles as made from them in other countries. Side by side there should be finished articles as are made locally. This will show the progress of the industry and indicate how far below the standard the local products still are. Museum.

Organisation of the Government Department of Technology.—The different departmental heads or directors will be under the Director of Industries for that province and they will be members of the Provincial Board of Directors of which the Director of Industries will be the President. The Director of Industries will be a sound man of business with general knowledge of technology.

The Provincial Boards of Industries will be controlled by the Member of Commerce and Industry of the Government of India.

Foremen are the products of practical experience and hence must be trained in the factory by the apprenticeship system. They can never anticipate an industry but must grow with it. They should improve their knowledge and cultivate scientific habits by attending the elementary and intermediate courses of the technological institute. Training of foremen.

In Bengal the great body of middle class youths who have had some school education should be attracted to these jobs. It is true that there was, and to a great extent there still is, the sentimental objection on the part of sons of Bhadrals to be called foremen or mistris. But those snobbish sentiments are fast dying out and we find youths of Bhadrals class serving as chauffeurs of motor cars in Calcutta.

In our tannery we have got Baidya and Brahmin youths as clickers in the boot and shoe-making department and have also received applications for apprenticeship in our tannery from several boys belonging to the middle class.

At the cabinet manufacturers' at Bowbazar the youths who do the sand-papering and varnishing of the furniture belong mostly to Bhadrals class.

In Calcutta Pottery Works my friend Mr. Deb has trained several youths of the Bhadrals class to be potters.

There are the signs of the times and clear indications that the Bengali middle class are realising the dignity of labour. From these it can be expected that should industrial growth in Bengal get an impetus at the hands and under the fostering care of the Government neither the Bengali capitalist nor the Bengali middle class would be failing to come forward.

Labourers.

For tanning industry there is absolutely no dearth of labour in Calcutta. According to the Census of 1911 in Bengal there are 136,553 Chamars (leather workers) of whom 86,504 are males and 455,448 Mochis—leather-workers and boot and shoe-makers—of whom 244,912 are males. Besides these, Chamars and Mochis come to Calcutta from Bihar and Orissa, North-Western Provinces and the Punjab.

In Calcutta alone there are 33,808 Chamars (25,454 males) and 12,703 Mochis (9,343 males).

The Chamars are hard-working, regular and intelligent. They are capable of easily adapting themselves to new methods of work and also understand new processes.

In our chrome tannery the Chamars who, previous to their coming to us, were only accustomed to bark tanning and had no idea of machine work quickly adapted themselves to the processes involved in chrome tanning. Some of them after a few months' practice learnt to work various machines with skill and intelligence and in fact for Rs. 15 to Rs. 20 per month. I am getting almost the same class of machine work from the Chamars for which in England and Germany 20 to 25 shillings are paid per week. If they are shown and instructed in improved methods of work by leather experts in the manner I have sketched earlier in this statement there is little doubt that they will be as skilled and as efficient hands as are found in Europe and America.

It has been found that by far better class of work is got from those who are literate. This suggests that more efficiency in labour would be got by the spread of primary education among the labouring classes.

Many of these Chamars are skilled bark tanners and taxidermists and the leathers that some of them turn out and the furs that some of them dress will, I am sure, excite admiration from the severest critic.

So far labour in the leather industries is concerned the ground appears to be quite fertile. It requires now careful sowing of seed to reap a rich harvest.

Leather industries have got immense prospects in Bengal as I have attempted to show in my note already submitted to the Commission.

The development of Indian leather industries will not only be of benefit to India but will increase the Imperial resources and is urgently needed to make the British Empire self-contained so far as leather is concerned. Although tanner's trade is not so spectacular as ammunition-making, leather is as much indispensable for the Army as powder and shell. In absence of sufficient hides and tanning materials in the United Kingdom it is idle to expect she herself would be able to meet all her requirements for leather. She must therefore get her supply from elsewhere and her first concern should be to get as much of it as possible from within the Empire, that is, from her dependencies and Colonies.

During the present war Madras and Bombay have done their bit to minister to the Imperial needs for leather but it is America who has supplied the bulk both of leathers and tanning materials, *viz.*, tannin extracts, and has really saved the situation.

If tanning industries were properly developed in India as her vast resources in hides and tans would justify, Indian leathers would have been valuable assets to the Empire, and England would not have required in that case to import American leathers and tans at inflated price at this time of economic stress.

ORAL EVIDENCE, 29TH NOVEMBER, 1916.

Mr. C. F. Low.—Q. You are manager of the National Tannery, Calcutta?—A. Yes; it was started about 1905, and is a proprietary concern.

Q. Is there any objection to mentioning the names of the partners?—A. There are no partners. It belongs to Dr. Nilratan Sircar.

Q. What capital is he employing in it?—A. I could not tell you.

Q. Is it succeeding at present?—A. Oh, yes.

Q. Who are purchasing your leather?—A. The leathers are purchased by local middle men, and we also export leathers to Agra, Bombay and Basrah.

Q. Do the Cawnpore leather factories, such as Cooper, Allen & Co., use your leather?—A. No, they don't.

Q. Do they use any chrome leather?—A. I heard that they used to before the war, but since the outbreak of war, they are busy with the making of ammunition boots, so they don't want chrome leather.

Q. Did you start on the chrome leather manufacture at once in 1905?—A. Yes, but with a side line in bark tanning, both were done, chrome as well as bark.

Q. Where do you purchase your hides from?—A. The bulk of them locally, and part from outside.

Q. Do you find any competition from big hide exporting firms; do they compete with you at all?—A. Oh, yes; we find enormous competition; as a matter of fact, prices of hides which we purchase have gone up 20 per cent. and the matter is getting worse and worse.

Q. Before the war did you find that these large hide-exporting firms put the prices up?—A. Of course the hide market used always to fluctuate in accordance with the shipments even before the war.

Q. What technical staff do you employ?—A. I am the expert there : I manage.

Q. Where was your training received?—A. I was trained at first in the University of Leeds, in the Leather Industries Department, and afterwards received some practical training in Germany and Italy.

Q. Did you go at your own expense or did you have a scholarship?—A. I secured a scholarship from the University of Calcutta.

Q. What other superior staff do you employ?—A. On the technical side I have got two Assistants. They have been trained in our tannery. They have now a good practical training in chrome leather manufacture. One is getting Rs. 100 and the other Rs. 75 per month.

Q. Had they any educational qualifications before they came?—A. They are failed Matrics.

Q. Are they Bhadrals?—A. Yes, they are relatives of Dr. Sircar.

Q. Who are your workmen?—A. They are of the Chamar class. In the tanning department they all belong to the Chamar class ; in the boot and shoe making, we generally get Mahomedans, and for one particular high class of shoes, we get Moolchies, and for some sort of machine work and cutting uppers we have got also Bhadrals boys.

Q. How much do they make?—A. They have been taken very recently as apprentices ; one is getting Rs. 22 and the other Rs. 14. The one getting Rs. 22 has learnt the work very well.

Q. What is their intention ; do they intend to stay on with you and earn as much as they can, or start on their own account?—A. I don't think their intention is to stay with us, unless we hold out sufficient prospects.

Q. Did you have any difficulty about capital for purchasing raw materials or holding stocks?—A. Yes.

Q. Have you tried to borrow from any banks or other financial institutions?—A. As a matter of fact, I have not got any personal knowledge about it, because the proprietor does that himself, but as far as I know, he experienced difficulty in getting money to hold stocks.

Q. Speaking of the employment of Bhadrals in industrial concerns, have you seen Bhadrals, during the last three or four years, taking to industrial employment in Calcutta more than they used to formerly?—A. My personal experience is that if a man can get a chance of getting a job in a tannery or other business, he will come forward. There is no difficulty in getting a man of the Bhadrals class into a tannery.

Q. It all depends, I suppose, on the pay?—A. On the prospects that you can hold out to them. A man will be ready to come on less than he gets elsewhere if he sees prospects of improving his condition.

Q. What education would a man of that type have?—A. They are generally only Matrics, or have failed in the Matriculation Examination.

Q. Do you find that those men are less intelligent than others who have taken their degree?—A. Not all of them ; as a matter of fact I have got one assistant who is not a graduate, but he has got more commonsense than an average graduate, and he is of better help to me than an M. A. or M. Sc. would probably be.

Q. In your first para. you talk about the investment of money. Do many Indians invest money in jute mills?—A. I don't know ; I have no experience.

Q. Nor whether they invest money in light railways?—A. I think so ; my information is that they have invested money in light railways.

Q. For what reason?—A. Because they are profitable, and they find that the investment is safe.

Q. Is it to any extent due to the guarantee?—A. I think so.

Q. That is to say, what capital seeks in Bengal is not necessarily industries, or any other particular kind of investment, but it looks for a guarantee?—A. It looks for a guarantee as regards safety.

Q. They prefer a guarantee rather than speculation?—A. Not always ; there is always a degree of speculation among some monied men, but on the whole it looks as if people wanted safety in regard to their savings. I think I have given some examples where investments have come very readily.

Q. Do you think that the local tanning of hides in Calcutta or in the neighbourhood of Calcutta can be taken up on a large scale?—A. I am not speaking merely of chrome tanning, but of tanning generally.

Q. How far do you think these hides in India can be tanned at a profit?—A. They can be tanned and exported in a rough tanned condition to England or elsewhere where they may be finished according to requirements.

Q. Do you think that could be done at a profit, given the capital and expert skill?—A. Yes,

Hon'ble Pandit M. M. Malaviya.—Q. You think that if the Government would come forward to help to establish Industrial Banks, then the difficulties of these enterprises would be solved?—A. That is my honest conviction.

Q. But you think that it is essential that Government should be connected, in some form, with the bank, either by subscribing part of the capital, or by guaranteeing interest, or by laying down that there shall be a Government audit for the bank?—A. In some form or other Government should be interested in those banks, in order to inspire public confidence.

Q. From your remarks which follow, am I right in inferring that you think that what is needed above all cases is that there should be confidence inspired in private persons in investing their capital in business enterprise?—A. Yes, that is my idea.

Q. And you think that that can be done by Government showing an interest in these enterprises?—A. Yes, that is my idea.

Q. You suggest that the number as well as the period of Government technical scholarships should be increased. Do you know the number of Government scholarships at present?—A. I think it is only two.

Q. What number do you suggest, in view of the training in the various industries that has to be provided; what number would you suggest for Bengal, for instance?—A. At least six every year.

Q. Do you think that these six scholarships will be sufficient to meet the industrial demands of a growing province?—A. My idea is that six will be better than two.

Q. I ask you this because you say, "technological institutions for the training of experts locally should be started in different provinces", and you also say that the training of experts "by sending men to foreign countries is very expensive", you think that men should receive their preliminary training here, and as the result of that a few of them should be sent to foreign countries. You would provide however for the education abroad of a large number of young men?—A. Yes, but only the best of educated men should be sent out.

Q. You suggest that tanning experts should pay periodical visits to local tanneries; do you think these tanneries will welcome the visits of these experts?—A. In the beginning they may not, but it all depends on the way they are approached.

Q. If they hold demonstrations, for instance, demonstrations in improved methods, do you think they will attract them?—A. That may attract a portion of them, but not all, because the condition of tanneries in Calcutta is rather curious. The bulk of them belong to very illiterate classes of people, mostly Chamars and Mahomedans. Of course they don't know the value of improvements, so long as they can sell their goods they are all right. But my honest conviction is that the processes which they use require a bit of overhauling and that is to be done by these experts.

Q. You suggest that they should go about like industrial missionaries, holding demonstrations and asking these tanners to see the improved methods they employ?—A. Yes, I have suggested that in my statement as well.

Hon'ble Sir P. H. Stewart.—Q. Is your factory in Calcutta still?—A. Yes, in the suburbs.

Q. How long have you been in this industry; since 1905?—A. No, I have been in this particular tannery about three years.

Q. Were you in another tannery in Calcutta before that?—A. No, just after I returned from Europe I joined this tannery.

Q. How long did your education take?—A. In Leeds I was for two years. Then I was apprenticed to an Italian Tannery near Milan for about one year. Then I went to Germany, and was employed there in a dye factory as a leather expert and Chemist.

Q. You were earning money in Germany?—A. Yes.

Q. How long were you there?—A. About 1½ years.

Q. Your experience is rather unique; not many of your countrymen have had a training like that?—A. Not many had a chance. I first met with difficulties in getting into a tannery.

Q. Did you have any special difficulty in getting apprenticed to this tannery in Germany?—A. Not in Germany, it was in Italy. When I finished my course I tried to get into an English tannery. Well, my professors, the Professor of Chemistry, as well as Mr. Procter of Leeds University, tried their best to get an apprenticeship for me either in Yorkshire or elsewhere, but no one would take me. I approached the India Office as well and went to Mr. Theodore Morrison and also to Dr. P. K. Ray. The latter could not help me; no one would in England, so I went to Germany, and in Germany I had a letter of introduction from Professor Procter to a German colour works. They took me as an apprentice for some time in the Leather Dyeing Department. There I made friends with a German leather expert. He had a brother who was manager of an Italian tannery. He gave me a letter to his brother, and I got into the tannery at Milan. Once I was there I made a big circle of friends.

Q. Were you one of the State Technical scholars?—**A.** No, it was not a Government scholarship; mine was an endowment scholarship belonging to the Calcutta University.

Q. You say you buy your hides locally; do you do that part of the work too?—**A.** I go to the slaughter houses occasionally and make purchases.

Q. You are an expert in the purchase of hides as well as in the manufacture of leather?—**A.** I cannot say I am an expert, but I have to make the best of the case. The practice in Calcutta is to buy hides from live stock while the animals are living. They are taken to the slaughter houses; there I see the animals and pick and choose and make my purchases. It is, of course, more difficult to select from dried hides.

Q. Have you had any experience of the foreign export trade; have you ever entered that at all?—**A.** Yes so far as statistics go, but I have never been engaged in it either in hide or leather.

Q. Are there any special difficulties that you have met with in your work at these tanneries, which you can tell us about?—**A.** Do you mean technical or business difficulties?

Q. Business?—**A.** Business difficulties are that we have not always sufficient funds.

Q. That would be common to all industries very often; say technical difficulties then?—**A.** The technical difficulties are many that we have to solve. Of course, I have to solve them myself in my tannery. We cannot turn out exactly the stuff as is turned out elsewhere in England or America.

Q. You think that you have succeeded in solving them; your tannery is progressing satisfactorily and is a prosperous concern?—**A.** Yes, I have solved them to such an extent that my goods are marketable and are sold at good prices, but I cannot say that I have solved them to the extent that they are equal to the best makes in America or England. Our leathers are now sold almost before they are made, *i.e.*, we get forward contracts.

Q. And you think that there is plenty of room for the expansion of this tanning trade?—**A.** Yes, there is very large room for the expansion of tanning of all sorts, but the difficulty in regard to chrome tanning is to get the right sort of material.

Q. But you think that it would be very necessary that someone who thoroughly understands it should be in charge of it? You have had a very varied practical training, of which others have not had an opportunity, but it would be a very dangerous thing to embark upon without practical experience or knowledge?—**A.** It would be dangerous, but practical experience can be got, if not in India, at home.

Hon'ble Sir Fazulbhoy Currimbhoy.—**Q.** You say you have got forward contracts, but before the war had you any forward contracts, or was there any difficulty in selling your products here?—**A.** In the early years there was difficulty for three or four years, because the outturn was of a very bad quality, and then too chrome leather was not much appreciated at that time. Afterwards when it was once made marketable, there was no difficulty in selling even before the war.

Q. Were you selling before the war at good profits?—**A.** It was a profitable concern before the war, only the tanning department, but not the boot-making department.

Q. You are making boots also?—**A.** Yes.

Q. Is the boot-making profitable now?—**A.** Yes.

Q. Have you got any experts in that line?—**A.** We have no experts. I have got to look to it.

Q. Have you got experience?—**A.** A little, not as much as of tanning.

Q. You think that you have a big scope for your tannery factory?—**A.** If we could enlarge it, we could make a bigger profit if we had the financial help.

Q. Do you want that a Technological College should be started in Calcutta?—**A.** Yes.

Q. Do you think it would be advisable to have the technical training of a primary grade to be given in the secondary schools too; the manual training and other things in the high schools?—**A.** Yes, if possible.

Q. Then they may be feeders for the Technological College?—**A.** Yes, that is a good idea.

Q. Or would you prefer matriculated boys to go to the Technological College?—**A.** Boys who have already got some technical education would be much better in the technological school.

Q. For research work you want a Central Technological College?—**A.** My plan is to have one Technological Institution over the different departments with research too. Advanced, Intermediate and Elementary, those three could be combined in one institution.

Q. Then with reference to Provincial Boards of Industries which you say "will be controlled by the Member of Commerce and Industry of the Government of India." You want this Department under the Member of Commerce?—**A.** Yes, that is one way of organising the department?

Hon'ble Sir R. N. Mookerjee.—**Q.** You are not acquainted with the financial part of this concern?—**A.** No, not very much.

Q. So that when you say that the industry is paying, you don't know what capital has already been expended, or whether it is paying on the present capital or on the capital expended

from the beginning?—A. I have got some rough idea about the money spent, which I am not prepared to lay before the Commission just now, because it may be that it is not the proprietor's idea about it. So far as the manufacturing accounts are concerned, I know that we are making profits.

Q. You are making profits at war time; taking the capital of the whole concern, from the beginning up to now, are you prepared to say that you are making profit; do you know the particulars about it?—A. Yes, I am prepared to say it is paying.

Q. Supposing for instance you expended from the beginning three lakhs, or five lakhs, are you making profit on the five lakhs at present?—A. No, because those five lakhs have been spent in very small instalments over ten years.

Q. You say it is paying because you take the capital for last year; you don't calculate from the beginning?—A. Taking the amount of profit we are making on the present capital, say for instance 20 per cent, if you calculate that on the whole capital expended we might be making, say, 5 per cent. Still we are making some profit.

Q. Are you certain you will make a profit when there are no war conditions?—A. With reference to this chrome tanning industry, the war has made very little difference because now we have increased the price of our output. The prices of raw materials have also gone high, so the margin of profit is almost the same.

Q. You are hopeful that even when prices come down to normal conditions you will make profit on the present capital?—A. Yes, on the present capital, only we shall have to make some extensions to better our situation.

Q. My question is whether this industry is a profitable concern, independent of the war conditions under which you are working?—A. Yes, it is profitable.

Q. You say you went to England with a scholarship from the Calcutta University, and you also say that "the past selection of candidates for these scholarships was not very happy." Do you mean only the Government selection or all of them?—A. I mean all of them.

Q. The students sent by the Indian Association, by the Government, and by the University are all included by you, and your experience is that the selection by all three of them was not a happy one?—A. Not always, because I know that the Government scholars who were sent ought not to have been sent.

Q. You say that "an attempt should be made to distil tar and produce some of the more important intermediate products at least, instead of running the entire quantity to waste." Are you aware that the coal tar industry is being already carried on in India?—A. I am not aware.

Q. It is being done very largely?—A. Not in regard to intermediate products.

Q. All bye-products from coal?—A. Coal tar is a bye-product from gas coal, but the distillation of coal tar for the manufacture of aniline colours.

Q. That is being done now?—A. They attempted to do it. Not only attempted, but they are selling and making profits.

Mr. C. L. Low.—Q. You say that "in selecting candidates for training as experts of a certain industry, stress should be laid not only on their scientific attainments but also on their experience of the industry as it exists in the country." Before you were selected for the scholarship by the Calcutta University, had you had any previous experience of the industry?—A. I had no experience of the tanning industry, but was connected with the chemical industry.

Q. I congratulate the Calcutta University on their choice in this case, but it was more or less a matter of chance from their point of view?—A. I also experienced many difficulties for the reason that I had no practical experience of tanning. Had I practical experience I should have been much better off.

Mr. A. Chatterton.—Q. What year did you go home?—A. 1909.

Q. You went home in 1909 and stayed two years in Leeds and then you went to Germany to the Dye laboratories of Messrs. Leopold Cassella & Co.?—A. Yes.

Q. And you found a good many Indian students there?—A. No, we were only two.

Q. They have a special instruction laboratory?—A. Yes, for everything, cotton and leather.

Q. Especially arranged for training students to use their dyes?—A. Yes.

Q. When you left Germany you went to Milan?—A. Yes.

Q. What processes of tanning were they using in that factory?—A. That was a very big factory. They were tanning box calf by the chrome process.

Q. Is this tannery connected with Lepetit Dolphus & Co.?—A. No.

Q. They were not using their products?—A. They might have been using their extracts.

Q. Did you go into this tannery so as to be trained in the method of using these extracts with a view to introducing them to India afterwards?—A. No, that was not the idea. It might have been the idea in the dye works of Cassella, but it was not in this Italian firm.

Q. You came back to India and joined the tannery of Dr. Sircar. When was that started?—A. I think it was in 1905.

Q. Before you came back?—A. Yes.

Q. You don't know who started that?—A. A student who was trained in the Madras, School of Arts, Debendro Choudhury. He was the first man.

Q. Now you are tanning chrome leather?—A. We are making box sides, all colours, black, light brown and chocolate.

Q. Did you experience difficulties lately on account of the supply of chemicals?—A. We held a large stock of chemicals, and are still getting a supply, but at an enormous price.

Q. What is the principal chemical that you use for tanning, chrome alum or bichromate?—A. We use both, whatever we can get. If we get chrome alum we use it. There is no standard; nowadays chrome alum is almost prohibitive, so we are using the other.

Q. With the two bath process?—A. No, one.

Q. Have you got any chemical assistants or are you dependant on your own chemical knowledge?—A. I am my own chemical assistant.

Q. Have you got a good knowledge of chemistry?—A. I have.

Q. Have you any educated people in your tannery, who are working there?—A. Yes.

Q. You mentioned that you have two assistants; have you any science graduate working in your tannery?—A. No.

Q. Do you want to get any?—A. I don't want at present.

Q. You don't want to develop your tannery?—A. We do.

Q. How are you going to do so without trained assistants?—A. We must extend our tannery first.

Q. Don't you think that would be putting the cart before the horse?—A. I don't think so. I cannot increase my establishment without extending my tannery. What work I have to do I can do with my two assistants. When my work is extended and my output increased, I shall be very glad to take a graduate.

Q. You say you think this is a splendid opportunity now to develop the trade in manufactured leather in Bengal?—A. Yes.

Q. What class of leather would you make from materials in the Calcutta market?—A. The best would go for chrome tanning; the cowhides and some of the buffalo hides may also go into chrome tanning for making picker bands.

Q. Have you tried making picker bands?—A. I have tried, but have not put my material on the market, but think I will succeed; in fact I have had enquiries for it from the mills.

Q. Have you made any picker bands yet?—A. I say I have not, but I am experimenting with it and I think I shall succeed. I have not made them for sale yet, but have made samples in the tannery, but whether they stand the test in actual work I don't know.

Q. Have you been making chrome buff leather?—A. Yes.

Q. Have you cut any picker bands out of that leather?—A. Yes, I have done exactly that.

Q. Have you sent any of these to the weaving sheds to be tried?—A. I have not.

Q. Why don't you?—A. I am going to do it.

Q. Have you been making any roller leather?—A. No.

Q. In the evidence you have placed before us you have drawn up a scheme for the development of the leather trade, and you have discussed in that note the staff that would be appointed for a leather Trade school. This scheme is drawn up on the lines of the Leeds University?—A. Yes.

Q. Supposing that Government starts—as a matter of fact Government has already started—a Leather Trade School, the question is whether it should be a school run on the Leeds line, in which laboratory work only is done, or whether it should be a demonstrative factory?—A. I want both of them to be combined in that school.

Q. The leather trade goes on all over India, and I suppose you would naturally like to see the school in Calcutta. From the broad point of view, is Calcutta the best place to set up such a school?—A. Calcutta is the best place, that is my view.

Q. Have you in your tannery any modern machinery?—A. Yes, we have chrome tanning machinery.

Q. A splitting machine?—A. Yes.

Q. Where do you get your workmen from to run these machines?—A. We had some difficulty in the beginning with that splitting machine; then we got an ordinary mechanic and he has been trained up.

Q. Taking that as a typical machine, once it started, was there any difficulty in keeping it at work?—A. None at present; it is giving me satisfactory work for the last two years. Of course we don't split the hides too thin. For our purposes they are all right.

Q. Are you doing any skin tanning?—A. Not very much.

Q. You don't use the splitting machine on that?—A. No we have not been doing much skins; we do all hides.

Babu M. N. Ghose.

Q. Supposing that you had large tanneries, do you think there would be any difficulty in training labour in Bengal?—A. I do not think so; I have not experienced any difficulty save and except with that splitting machine.

Q. How many men have you in this tannery?—A. In the tannery I have got about 50 men, and in the boot department another 50.

Q. Have you got any boot-making machinery, or is it all done by hand?—A. We have got most of the machines.

WITNESS NO. 89.

BABU M. N. GHOSE, *Manager, the Jessore Comb, Button and Mat Manufacturing Co., Ltd., Jessore.*

WITNESS EVIDENCE.

Capital.

On my return from Japan, I, in conjunction with several local gentlemen of Jessore, started the Jessore Comb, Button and Mat Manufacturing Co., Limited, in the year 1909, for which we wanted Rs. 50,000. But capital in this country being extremely shy, it was with the utmost difficulty that we could secure only Rs. 25,000 in the course of three years. It was consequently very difficult for us to go on with the work, and the attempt to raise a loan of a few thousand rupees from some local and Calcutta banks on the security of machinery and manufactured articles failed. People often demand almost absolute certainty of profits, even in the case of industries which have been well established, so that experts or managers, whose time should chiefly be devoted to the supervision and management of the factory and office, have to go about canvassing the country for the supply of capital, with the result that such canvassing, instead of helping us in raising the capital, materially affects the effective supervision and control of the concern. Thus it will appear that what is done by professional canvassers in other countries is being chiefly done here by the experts themselves so far as the industries managed by Indians are concerned.

Government assistance.

As regards my suggestions for removing the difficulties in the way of raising the capital I shall deal here with question 5. I think no industrial ventures can succeed and give the people of the country a decent means of livelihood unless they are taken under Government protection, supervision and patronage especially in case of new and infant industries. Investors in this country find more profit in banking and money-lending businesses. It is well-known that the various loan offices in the mofussil towns of Bengal, which ordinarily pay not less than 6 per cent. interest on fixed deposits, are prosperous and thriving concerns and that in the presidency towns wealthy people prefer investment of their moneys in banks giving interest at 4 per cent. to laying out capital in uncertain business enterprises. The reason is not far to seek. Of late several industrial enterprises of Bengal have recorded dismal failures and have ruined many humble investors by their sudden collapse, though they were started under the inspiring enthusiasm of dawning national self-consciousness. People, rich and poor, in their first flush of enthusiasm poured out money to make them a success, and I may be permitted to say that these industrial undertakings, the failure of which was due to ignorant, unscrupulous and inefficient management in most cases, would not have died prematurely, had the Government come to their rescue as in the case of co-operative credit societies.

Here it can be safely stated that the industries which I represent as well as other similar industries are quite new in this country and are still in their infancy. Hence much more difficulty is experienced in raising capital for such concerns, as the people are now diffident to subscribe to their funds. To obviate this difficulty I should propose that Government aid as stated in question 5 is necessary for the raising of capital. My suggestion therefore is that the Government should help our infant industries either by advancing loans at a nominal interest, say 5 per cent. or guaranteeing dividends at 6 per cent. at least, for this will attract the investing public and at the same time encourage banks and suppliers of machinery and raw materials to allow credit to the concerns.

But even when the required capital is fully subscribed and articles manufactured attain the desired finish and quality, there is great difficulty in pushing them in the market in competition with similar cheap foreign made articles manufactured under favourable circumstances, unless the Government again comes forward to help those industries with State bounties or high protective duties till they can stand on their own legs. The Government purchase of products at a reasonable profit to the producers will also go a long way to establish those industries producing articles generally used by Government and I trust the Government will not hesitate to purchase such articles even at a higher price to encourage local industries.

So far as my experience goes, capital is principally drawn from professional people and a few landholders.

Pioneer factories.

I have no personal experience of any pioneer factories in India but have seen some in Japan. At the present stage of our struggle we need some Government pioneer factories to lead us on. What Japan did in this respect may be followed here with profit. The following extracts from Professor Hamilton's remarks may be interesting:—

"Since 1870 the Government of Japan commenced model factories, and a silk spinning mill was started in that year. A model mill was also established for cotton spinning and the

supply of spinning plants on easy terms to the people was initiated. A model filature was started with a view to popularise labour saving appliances in the manufacture of raw silk, and the workmen trained there were spread all over the silk districts. A glass factory and a paper mill were established in 1876. Machine making, soap making, type founding and porcelain making followed in quick succession and imparted a powerful impulse to the progress throughout Japan. Meanwhile factories modelled after those established by the Government began to be started by the people, and the Government no longer perceiving the necessity of maintaining its model factories began to sell them about the year 1880."

Since the existing banks do not as a rule offer any facility to industries under Indian management, the establishment of Industrial Banks in all industrial centres financed by Government is urgently required. These banks will render financial aid to industries according to the needs in each case. Banking facilities.

There should be commercial museums in all the principal towns of India and periodical exhibitions should be held there. In these museums side by side with indigenous products there should be exhibited similar foreign-made articles with their places of origin and prices noted against them. In each museum there should be at least one good and competent consulting chemist whose duty will be to analyse samples and to explain the processes of manufacture whenever necessary. An industrial journal in this connection will be of much use to all interested in industries and commerce. Reference libraries should also be attached to each museum. In this connection I may say that the Calcutta museum has done much in the way of advertising our goods and which has helped us much in securing customers from other provinces as well. We have been highly benefited by this institution. Commercial museums.

The principal Government departments using imported articles should publish lists with prices of those articles and exhibit them in the commercial museums. The list should contain their sources of supply and the rates at which the Government purchases them. Some responsible Government officers of the purchasing departments would do well to visit the local factories manufacturing Government requirements and help them with their suggestions. The last part of my answer to question 5 may be referred to. Government patronage.

The present law for the acquisition of lands should be so modified as to enable Government to acquire lands for and on behalf of industrial companies whenever necessary. Land policy.

As regards labour which is chiefly drawn from the working and the middle class people we experience much difficulty in improving the labourer's efficiency and skill. In these days of keen competition and high prices of the staple food and other necessities of life, the labourers usually demand higher wages than our funds permit. While we pay wages at the rate of Rs. 8 to Rs. 10 per month, the ordinary labourers can easily earn Rs. 12 to Rs. 15 per month under the agricultural classes of Bengal. Moreover, the number of local labourers is getting small on account of malaria. This causes a great demand for foreign imported labourers, both by the Bhadrak and the agricultural classes, who offer higher wages and other inducements to retain their services. Training of labour.

In our factory, in addition to the working class, we have some Brahmins, Kayasthas and Khatrias, who, however, soon leave the factory as soon as they get better openings elsewhere. Owing to the want of regular supply of work arising out of the paucity of our funds, we are unable at present to retain the services of skilled and efficient labourers, who always try to secure some permanent jobs on higher wages for the maintenance of their families. Of course under the management of good experts we may turn out efficient hands; but the problem before us is how to retain their services in the face of keen competition, want of sufficient working capital and the insanitary condition of mofussil towns of Bengal referred to above. As regards working capital, I may quote here Mr. Swan's report:—

"Adequate capital is particularly necessary in the case of industries run by Indian capital and under Indian management owing to the reluctance of banks and of firms that supply machinery and raw materials to give them credit. When a concern has to pay cash for its raw materials and at the same time to allow credit to its customers, it must have at its command much more working capital than a similar business which enjoys the usual banking facilities."

Young men coming out from technical institutions should undergo a period of apprenticeship in some established factories and thus qualify themselves for the responsible duties of experts, supervisors or managers as the case may be. Training of technical staff.

State scholarships should be given to experts for studying foreign methods at an interval of four or five years. The Government should also assist them in getting admission into factories in foreign countries and see that every facility is given to them for utilising their time to the best advantage.

In this direction too we can follow the Japanese with some advantage. How Japan so suddenly emerged from the position of an agricultural country to that of a leader among industrial nations is worth our careful consideration. Side by side with the encouragement of industries, technical schools and colleges were established throughout Japan. Besides the four Universities that impart scientific training in the various faculties, there are 14 special technical colleges, 391 technical schools and 4,908 supplementary technical schools. Colleges of commerce.

Considering the area and population of India, we require at least five times as many institutions as in Japan to impart efficient technical and commercial training to our young men.

Save and except in the case of agriculture, the dissemination of information should at present be through English.

Other Government publications.

Besides the trade journals in connection with museums, each technical college, especially those imparting chemical knowledge, should have a journal of its own, where the professors and the students can publish the results of their researches and investigations.

Occasional articles from those trained in foreign countries and engaged in local factories will help the students much.

Railway freights.

The present inland railway charges, both parcel and goods, are very exorbitant. These should be considerably reduced for carrying raw materials, machines and finished articles.

We took up the manufacture of mats from grass reeds but had subsequently to stop it on account of the excessive railway charges of reeds from Midnapore to Jessore. We experienced the same difficulty on the occasion of His Excellency the Governor of Bengal's visit to our factory when we brought some sulphuric and nitric acids and methylated spirit for experimental purposes from Calcutta to Jessore, a distance of 74 miles only. The railway freight was so very heavy, nay prohibitive, that the cost of celluloid became twice as much as we estimated.

General.

Manufactures of the following articles may be taken up with much profit to the organisers:—(1) bone and horn products, (2) tanning, (3) jute and hemp products, (4) Coconut shell and fibre products, and (5) date sugar industry.

(Witness here gave confidential evidence.)

ORAL EVIDENCE, 29TH NOVEMBER, 1916.

Mr. C. E. Low.—Q. I understand that you are the manager of the Jessore Comb, Button and Mat Manufacturing Company. That you say is a limited company. You wanted a capital of Rs. 50,000 and you could get only Rs. 25,000. Have you not succeeded in getting a loan so far?—A. I tried very hard to get a loan from the loan offices in Jessore and from the local banks and also some other banks. None of them wanted to give us a loan of Rs. 5,000 on the security of machinery, raw materials or stocks.

Q. How did you get hold of the premises?—A. It is not free hold. It is municipal land taken on lease for 99 years.

Q. Would the capitalists not give you any money or did they charge high interest?—A. They did not want to give us any money at all.

Q. What technical training have you had?—A. I had technical training in Japan, especially in celluloid and celluloid article making.

Q. Making combs, buttons, etc., out of celluloid?—A. Yes.

Q. How long were you in Japan?—A. Three years.

Q. Were you at any Japanese Government institution?—A. I was in a Japanese Government institution as I wanted to learn the camphor trade which is a Government monopoly. There I had been only six months for watching the cultivation of camphor plants and the production of raw camphor. But most of my time was spent in learning the manufacture of celluloid.

Q. Jessore is your native town?—A. It is my native town.

Q. Are there not any financing agencies or firms in Jessore?—A. There are three financing agencies. They advance money only on houses, landed property, ornaments, etc.

Q. They are not banks but money-lenders?—A. Yes. But there is a trading corporation also.

Q. Is that the one with an authorized capital of 10 crores?—A. No. Its capital is only one lakh.

Q. What staff do you employ at the factory?—A. Generally people from the middle class. Apprentices I may call them.

Q. Do you get men from the Bhadrolog class?—A. I get only Bhadrolog class now.

Q. They work at the machines with their hands?—A. Yes.

Q. How much pay do they get to start with?—A. They start from Rs. 7. But as time goes on I have to increase their wages. The first man now gets Rs. 20 and others get Rs. 17, Rs. 15 and so on.

Q. Do these men possess any qualifications at all, I mean educational qualifications?—A. Not very high. Most of them have only elementary education.

Q. You say that if dividends were guaranteed at 8 per cent. by Government, then the public would invest. Which do you think would be better, to guarantee the dividend to an industry, or guarantee dividends to a bank in order to enable it to advance?—A. If the Government guarantees dividends, then we may get help from the banks also.

Q. Which do you think people will sooner invest in, an industry with a dividend guaranteed by Government or a bank on the same conditions?—A. I think the banks.

Q. You keep some of your stuff in the commercial museum. Do you find any sale arising from it?—A. I have got a market in Madras and Bombay through the museum.

Q. Supposing these museums were further developed would it improve your custom?—A. Certainly so. We should have as many of them as possible.

Q. Would you like to have arrangements for sales?—A. We have ready sales for all our manufactures at present.

Q. What is your turn-over in a year?—A. About Rs. 12,000 worth.

Q. You sold them readily?—A. Yes.

Q. Do you find that the imported combs compete with your goods? Are they sold cheaper?—A. The Japanese articles are selling cheaper. The German and Austrian articles are not selling so cheap. I am competing with them successfully.

Q. Are the Japanese articles better?—A. The price is cheaper but the article is not good.

Q. What is your things made of?—A. The same material.

Q. You do not find any difficulty in getting your raw material?—A. Now we do not get raw material at all.

Q. How do you make combs?—A. Formerly we used to get celluloid from Germany. The thing is that after seeing so many dismal failures in industrial undertakings in this country we took extraordinary precautions. Now having seen a prospect of making the business a success we have advanced the capital by the addition of another Rs. 10,000. In that year we made some profit. So the organisers were encouraged.

Q. In what year?—A. 1912-13 and also 1913-14. Our ulterior motive was to make celluloid ourselves. In the meantime the war broke out.

Q. Of what material do you make combs now?—A. Horn. For this, we have to train the labourers again now.

Q. How long does it take to train the labourers?—A. We took this business up only during the last six months and they are not well trained yet. I think that another six months would be required. In the meantime we have sent for celluloid machines from Japan and we do not know whether we shall get them.

Q. Can you get camphor?—A. We can get that from the local market.

Hon'ble Pandit M. M. Malaviya.—Q. You say that you have tried to get loans from local banks on the security of your machinery?—A. They would not give us a loan on that security. They said that the machinery is not worth the material it is made of.

Q. Do you mean to say that your factory was going on as a working concern and turning out good articles, and you wanted a loan on the security of your machinery and yet they would not give it to you?—A. Our managing agent is a zamindar, and on his executing a note in his own hand and on taking the responsibility on himself, we were advanced Rs. 2,000 and the rate of interest was 12 per cent. Every month we were asked to clear our debt.

Q. You think then that if there is a bank which is started by Government with the object of financing industrial enterprises, a concern like yours which is turning out goods in a fair way would be able to obtain accommodation?—A. Yes.

Q. If you had an industrial bank supported by Government do you think this bank could afford the necessary help to the smaller industries also?—A. That could be done at a later stage. The industries in the beginning should have some capital and when the articles are produced and approved by the market, then the bank could help.

Q. You think that Government should come forward to help to start industries in the initial stages either by advancing loans at nominal interest or by guaranteeing interest?—A. Yes.

Q. You wish the Government to start pioneer factories on the lines of Japan? Have not these factories that you speak of multiplied in Japan?—A. Now the Japan Government need not start factories. The people have now well understood the processes.

Q. They have multiplied?—A. Everywhere there are factories. In fact every house is a factory. I lived in Osaka for some time. It is bigger than Calcutta and every house is a factory, where something or other is being manufactured.

Q. Has the money that the Japanese Government spent been repaid many times?—A. I think that in the course of the last two years it has been more than amply repaid.

Q. Have you seen the supplementary technical schools of Japan? Have you been to any of them? What is the course of instruction that they provide?—A. Yes. In the commercial branch the important subject that they take up is banking.

Q. They supplement the work of the general elementary school and they give an elementary kind of technical instruction?—A. I have seen several technical schools in Japan. I remember some of the subjects that are taught there. They take up a number of special subjects. For instance in some they take up dyeing, in others porcelain, carpentry and so on.

Q. These 391 technical schools that you speak of are schools above these supplementary technical schools? Do they correspond to our high schools here or are they higher than that?—A. Yes. As they give practical instruction we cannot compare them. In fact the training that is given there in the middle vernacular schools many of our graduates do not get here.

Q. You speak of 14 technical colleges. Are they the highest type of technical institutions?—A. Only those who pass from the technical schools are allowed to enter these colleges.

Q. They receive their finishing education there?—A. Yes. Most of the students from these colleges are selected for training in foreign countries and they are given scholarships.

Q. Out of these students those who show promise are sent to foreign countries?—A. Generally. The experts of private factories are also sent by Government to foreign countries at Government expense.

Q. Do the Japanese Government even now send a large number of students to foreign countries?—A. I came from Japan in the year 1909. Till that time they used to send only a limited number. I do not know now what they are doing.

Hon'ble Sir F. H. Stewart.—Q. You say that Jessore is your native city. Is that the only reason that you started your factory there?—A. Our president who was the organiser of the factory was the landowner of that place. He helped me to go to Japan for education. It was at his suggestion that the factory was started in Jessore.

Q. You have spoken about your difficulties on account of the freight rates. Could you not move without much loss and inconvenience to a better centre?—A. We are just thinking of removing our field of activity to Calcutta on account of these difficulties. In fact we are now compelled to do so.

Q. How many men do you employ?—A. At present we employ only 20 men.

Q. Could you get your labour without trouble in Calcutta?—A. There may not be any difficulty in getting men but we shall take a year to train people here again.

Q. You say that you have an idea of making your own celluloid. Is that a feasible proposition?—A. That is feasible in Calcutta, not in Jessore.

Q. You say that you had great difficulty in securing money. Will you be able to get the additional money for manufacturing celluloid?—A. From the public I could not get anything. I tried my best to get it first from Bengal and then I had been to Burma for capital. There too I could not get the required capital. I was rather disappointed and then I approached the Maharaja of Kasimbazar who has promised to advance the money on his own private account and in fact he has already paid the sum required for the machinery.

Q. You cannot get the machinery just now?—A. The Japanese people have promised to send the machinery and I have sent the money.

Q. You say that the Japanese are your formidable competitors. Do you consider that in quality their articles are better?—A. I consider mine is better.

Q. In appearance and finish how do they compare?—A. In appearance and finish their goods are not bad but they are not durable at all.

Q. How is it that they are able to undersell your goods?—A. When they want to compete with any foreign country they get large Government bounties in Japan.

Q. Do you know this personally as a fact?—A. I have heard it stated freely in Japan.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You say that the present law for the acquisition of lands should be modified. In what way do you want to modify that law? You want the other people's land to be purchased for you cheaper than the market price?—A. Not cheaper. It should be modified with regard to particular locality that is wanted. For instance if we require for industrial purposes land which is close to the river side or to the railway side and if the land belongs to a private party we cannot get it very often. They may refuse to sell it altogether. We felt the difficulty in starting our factory. The land on which our factory stands belongs to the Jessore Municipality. We wanted to purchase the land and only by persuasion and influence we got the Commissioners to give us the land at a price higher than the neighbouring lands and on conditions which would be considered ridiculous. They have put the condition that if this factory is removed or liquidated or anything of the sort happens then the land with the buildings and the machinery would go to the municipality.

Q. So you want the land to be acquired for you by Government?—A. It would be better just as in the case of railways.

Q. The railways are useful to the public whereas the factory can only profit one individual?—A. Our people have got to be convinced that industries are also useful to the public. Otherwise serious inconvenience will be caused.

Q. About these Japan schools and colleges are the technical schools a sort of feeder for higher schools?—A. Yes. From secondary schools they also go to the factories.

Hon'ble Sir R. N. Mookerjee.—Q. Do you think that any bank would finance your concern, if you cannot show that you are making a profit?—A. That is the stage at which we are now. We are not getting any help from banks although we are making some profit.

Q. You are a business man and I am putting you a very simple question. Do you think that the banks would be able to advance any money when you cannot show that you are making any profits?—A. In the years 1912-13 and 1913-14 when we had no profits we could not have loans from banks.

Mr. A. Chatterton.—Q. How much dividend did you declare last year in your comb factory?—A. 4 per cent. in 1912-13 and the same thing in 1913-14. *Mr. C. W. F. Cockburn.*

Q. Where do you get your celluloid from?—A. We used to get it from Germany before the war.

Q. And now?—A. We do not get it now. We placed some orders with a Japanese firm. They showed one sample and when we ordered we found that quite a different thing had been sent. We have stopped the orders now.

Q. You have turned to horn now?—A. Yes.

Q. What is the economic advantage of establishing an industry in which you have to import all your raw material and simply cut them up and put them on the market?—A. Our ulterior motive is to manufacture celluloid ourselves.

Q. Have you made any progress in this direction?—A. We could not do it during the war. The people have lost all confidence in limited concerns. Otherwise we should have done it in the ordinary course of things. I have, however, induced the Maharaja of Kasimbazar to start a celluloid factory which will supply our requirements at Jessore.

Q. What are the raw materials that you use for making celluloid?—A. Cotton and acids, sulphuric and nitric, spirit and camphor. These are the ingredients.

Q. Which is the most expensive, the acid or the cotton?—A. Camphor is the most expensive.

Q. If you are going to start the celluloid industry would it not be better to establish it near acid works?—A. That is what we are thinking of. We shall take up a house near the Bengal Chemical and Pharmaceutical Works in Calcutta.

Q. Do they make sulphuric and nitric acid? Do you propose to make celluloid alongside the acid factory and in that way to avoid all cost of packing and carriage of the acid?—A. Yes. Moreover we can resell the acids which are once used. That we cannot do from Jessore. The railway freight will take up the whole profit.

Q. Have you got much stock of manufactured articles in your factory?—A. Not at present.

Q. Why did you not start your factory at a place where you would avoid big railway freight?—A. Personally speaking I am willing to come down to Calcutta. But our organisers are not willing to part with the factory. They want to have the name of Jessore. For the last three years I have been pressing them. I tried to convince them that Jessore is not the place for taking up the manufacture. They want to have the name of the district.

Q. That is common in Bengal?—A. That is our weakness rather.

(Witness here gave confidential evidence.)

WITNESS No. 90.

Mr. C. W. F. COCKBURN, Honorary Secretary, representing the Kodarma Mica Mining Association.

WRITTEN EVIDENCE.

I have the honour to forward you herewith answers to some of the questions in so far as they are applicable to the mica industry, and have incorporated these answers in the form of a treatise which will perhaps be the most satisfactory manner of dealing with this subject

I propose to deal with the subject from the following points of view:—

Firstly, its importance.

Secondly, the conditions under which the industry is at present being carried on and defects.

Thirdly, suggested remedies for these defects.

Firstly, its importance.—The mica industry is one of the utmost national importance, The mica more especially at the present time. The district of Hazaribagh and parts of the adjoining districts of Gaya and Monghyr form most important mica producing areas: the greatest production being from the Hazaribagh district.

Mica in its various forms is an absolute integral part of practically every electrical appliance and apparatus, and is absolutely indispensable. With the growth of the electrical industry the supplies of mica will have to grow in proportion.

In this present war very large quantities of mica are being used in the manufacture of munitions, and, therefore, the mica industry has become one of the key industries of the Empire: in other words it is an imperial asset.

Secondly, conditions under which the industry is at present being carried on and defects.—This key industry is at present working under regulations which not only permit of ruthless waste of the existing deposits and badly worked mines, but do not provide any remedies.

In the earlier days of this industry, practically all the mica produced was on or quite near the surface, and consequently there was no great need at that time for the enforcement of regulations and restrictions concerning the conservation of the deposits: although, if there had been some regular method insisted upon with regard to the conservation of the deposits and mines, the industry would have been in a much better state than it is to-day. Since those days, however, practically all the surface deposits have been exhausted, and it has now become necessary to treat mica mining on regular scientific principles, that is to say, the installation of machinery has become necessary, and generally speaking mines have to be worked on regular mining methods in order to conserve the mines and to obtain the best and most durable results.

The Indian Mines Act is, in effect only concerned with the safety of the labour working in the mines, but is not in any way concerned with the welfare of the mines themselves. Inspectors of mines under whose jurisdiction the mica belt falls are practically all men who have been trained in the collieries and therefore it is not unnatural for them to gauge mica mining by their experience of coal mining.

Coal is found in regular seams which can be tested, whereas mica exists in extraordinary veins and pockets, and cannot be tested by means of boring.

From the above it will be clearly seen that the mica industry requires treatment suitable to the industry, and cannot be coupled up with any other class of mining, such as coal.

There are no regulations or restrictions on the method of mining. Any one can do exactly what he likes in the way he works a mine. There are instances without number in which the deposits have been followed down to a certain depth in the most irregular way, and when the deposit has appeared to diminish in value the workings have been left and the pillars cut, and any further exploitation has become impossible through the former entrances. It is found desirable to open up such a mine again the only method is to drive a vertical shaft at a safe distance from the old workings, and then to drive a horizontal shaft or drive from the vertical shaft at a depth where safety will be secured from the old workings, or other similar methods.

This not only means a big capital outlay, but also a loss on that part of the deposit which has been left in the old workings, and also that part of the deposit which for the sake of safety has had to be left between the new and lower area and the bottom of the old workings. All this could have been saved if the restrictions had been such that it was not possible for any one to destroy the future prospects of the deposits or mines.

Police regulations.

The existing police regulations are such that those who wish to steal mica can do so with impunity. The reason of this is that the same quality and colour of mica can be found at two ends of the area, and also in the middle at one and the same time, and therefore the question of *identification* is practically impossible.

The mica has not only to be claimed by the rightful owner, but has also to be *identified* by him in order to convince the police authorities, and afterwards the court of justice, in order to secure punishment for the accused. This theft of mica has grown to alarming proportions, and is growing worse and worse day by day. The result of this is that those who have outlaid capital in the developments of their mines are not permitted to obtain the full benefit from their efforts in that they are not allowed to have all of their own mica.

Technical knowledge.

There are concerns who have the best intention of working their mines properly with a view to their conservation, but are unable to do so owing to the lack of proper technical knowledge.

Thirdly, suggested remedies for the above defects.—Regulations and restrictions should be placed upon the industry to enforce the working of mine deposits in a proper and miner-like fashion, and such regulations and restrictions should be thoroughly insisted upon.

Such regulations should make it impossible for any miner to work the deposit merely for his own interest to the depreciation of the Imperial asset.

It is suggested that Government should appoint a special inspector of mines who has had a thorough knowledge of metal mining—not coal mining. Such an official should, before he enters upon his duties, be attached to all the more important mining concerns, one by one, in order to thoroughly learn and appreciate all the true conditions under which the industry is at present being worked, so that he may afterwards know exactly the feelings and conditions of those concerns whose mines he will ultimately have to inspect on behalf of Government.

It is further urged that the Government should work in co-operation with this Association in regard to the appointment of any such official inspector of mines, and that after such mines inspector has taken up his duties, that he in turn should work in co-operation with this Association whereby he will derive the full benefit of the experience gained by the Association from all general points of view.

Referring to the second difficulty, theft of mica.—The practical solution to this difficulty will be the removal of the onus of proof from the shoulders of the rightful owner of the mica stolen to the shoulders of the person accused or suspected of stealing it. The existing police regulations for Howrah form a satisfactory basis for this:

The third difficulty, i.e., want of proper technical knowledge.—The suggested appointment by Government of a special inspector of mines might easily be the means of supplying technical knowledge to those persons and concerns who now lack this. Lectures should be given,

may, once a week or once a month, in order to instruct the managers of mines how to overcome their numerous difficulties, after of course, any such official has become thoroughly acquainted with all local conditions. In this way an official appointed by Government could perform the joint duties of the Government inspector of mines and technical instructor.

In reviewing the above, it is obvious that even if the present system of regulations both under the Mines Act and the Police regulations and the absence of proper technical instructions were not matters of such great importance in the early days of this industry, they are to-day matters which require immediate rectification after the most serious consideration. The whole of the industry has changed not only from a mining point of view, but as regards its importance amongst the key industries of the Empire, and therefore it should receive treatment which is absolutely suitable and it should not be coupled up with any other mining industry such as lime stone, manganese or coal, etc., but such regulations and restrictions should be applicable to the mica industry only.

There is no doubt that the introduction of proper regulations and restrictions will, to some extent, revolutionize the industry, but this is most necessary for the future welfare of the industry.

In the absence of such restrictions the ultimate fate of the industry will be sealed, and all the deposits will, for the most part, have to be abandoned although still containing large quantities of mica.

In order to help the mica industry, it is absolutely necessary and of the most immediate importance for Government to take such steps that will prevent the theft of mica, and thus allow those who are doing their best to work their mines properly to receive the whole of their output, and thus afford them a reasonable chance of success.

Although I have only mentioned three main defects, yet there are many other defects such as the want of proper road communications in the district, special regulations in regard to the Kodarma forest and facilities to those working in the Kodarma reserved forest, but these points can, no doubt, be discussed in Calcutta.

I am prepared to support the following statements in oral examination, and to give complete instances of the various defects mentioned.

ORAL EVIDENCE, 30TH NOVEMBER, 1916.

President.—Q. You are the Secretary of the Kodarma Mica Mining Association?—A. Yes.

Q. Can you tell us what the constitution of that Association is?—A. Most of the leading firms in mica in this district are represented usually by their Managers. The Chairman is the Deputy Commissioner of Hazaribagh *ex-officio*.

Q. Have you any qualifications for membership?—A. Members must be the proprietors of a mica mine or mines or their proxies.

Q. Do you elect the members?—A. The members are elected at a general meeting on a majority of votes, and I am directed to make all the necessary arrangements for their formal entry.

Q. Can you tell us how many there are?—A. There are eleven. They include mica miners in the zemindaris. The amount of mica land in the Government reserved forest is not really very large. It is large in itself, but not in proportion.

Q. Do you know anything about the Bihar and Orissa Mica Association?—I have heard of it, but the whole thing, I think, fizzled out.

Q. How long have you yourself been engaged in mica mining?—A. Six years.

Q. What mines are you controlling?—A. Personally I am not controlling any mines now. We have a mines department actually controlling the mines. I was superintendent of the mines department for some little time.

Q. You are under Messrs. Chrestien & Co., Ltd.?—A. Yes.

Q. Are most of your mica leases in Government land or zemindaris?—A. We own a good deal of area in both.

Q. Are the conditions for mica mining similar in both the areas, that is to say, in the form of lease?—A. No. They are not similar.

Q. Would not that stand in the way of any kind of regulations dealing with the question of mica thieving?—A. Not at all.

Q. Would it be possible for the Government to control mica mining in Ganwan and other zemindaris?—A. Yes.

Q. They could not interfere with the terms of the lease I suppose?—A. I do not think that it would make any difference. Any restrictions or conditions that Government might like to impose would, I think, be entirely outside the existing leases from ordinary zemindars.

Q. Would it be possible to impose restrictions consistent with the terms of the leases?—A. I should think so.

Q. Is it possible for a man to have a very small plot, or is he compelled to take up a plot of a certain size?—A. I am talking of both Government land and zemindari land.

Q. In the case of Government he can take up a plot of one square which usually amounts to about 40 acres, and in the case of an ordinary zemindari he can buy a hukumnamah for about Rs. 5 and make a hole and produce a considerable amount of mica.

Q. That is a means of covering mica thieving?—A. Yes. One of them.

Q. The way in which a man gets a small lease with facility?—A. Yes. It is quite easy for a man to arrange with a zemindar to pay him a nominal amount, such as Rs. 5, and then to raise mica worth Rs. 25,000 to Rs. 50,000 or something like that. Under the present conditions it is impossible to do anything to stop thieving, the difficulty being the question of identification.

Q. You cannot identify a sheet of mica in any way?—A. No. If you find a man selling and even if you catch him almost red-handed, he goes up to the thana and you are asked to identify the mica, which is absolutely impossible.

Q. The real onus is thrown on the accuser?—A. Yes.

Q. Many mica companies work by contract or through contractors?—A. Many do.

Q. They obtain leases and allow certain areas to be worked by contractors?—A. Yes.

Q. Does that system increase the facility for mica thieving, because the contractors themselves become receivers of stolen mica and hand over the thing to those from whom they have taken the contract?—A. One's own coolies are bigger thieves than any one. In a firm employing a large number of coolies each cooly has his little share. In our own case we lose about 50 per cent. of our output. The idea of having contractors really, as in my own case, is the only thing to do. In our own particular instance, in Ganwan, there are lots of people and if you do not employ them as contractors they simply steal mica from you and you have no control over them, and it is far better to have them as contractors under the present conditions. The only thing we can do is to take these people and employ them in our own property.

Q. You are driven in fact to recognise the practice of mica thieving?—A. Not that. We are not driven to recognise the practice, but we are driven to prevent a great deal more of it. In fact, we tried an experiment by not using these people as contractors in Ganwan and we found that the amount of stuff going out of Ganwan was considerably more than when we had them as contractors, and so we took them in as contractors. That is the only thing we can do and even then they rob us.

Q. I have heard it suggested that the difficulty may be removed if the Government appointed a limited number of agencies to receive mica for transport out of the district. Could a scheme of that kind be worked out by your Association?—A. It will lead to a good deal of complication. It is rather a complicated system.

Q. They would be the only people authorised to transmit mica from the district to the outside market, and their depôts would be in effect like custom houses at a port. You do not think that a scheme of that kind has been thought out by your Association?—A. We have not given it any serious consideration.

Q. I am asking you to think about this, because one does not want to adopt special legislation if the same good can be effected without legislation, which must cut across too many interests, because you have got zemindari land and Government land being worked together by the same concerns?—A. I can place it before the Association.*

Q. It would be the business of the authorised agent, before receiving mica to satisfy himself that it came from a mine?—A. Yes.

Q. And that would have a good moral effect even if it were not always effectual in checking thefts?—A. What would be the objection if the onus of proof is shifted?

Q. You will have to work that through the police, through their minor officials, and it may lead to abuse?—A. It will be very difficult to get at the figures of mica stolen. There are lots of mica receiving people.

Mr. C. E. Low.—Q. This proposal to shift the onus of proof on to the thief is an old question in Chota Nagpur? Have you had any discussions with the Local Government on the subject?—A. We offered the draft of a bill once on the occasion of Sir Charles Bayley's visit to Kodarma but it was not approved. Personally I should say it was a little too complicated.

Q. Why did they not approve of it? Did they express any opinion on the principle regarding the onus of proof?—A. No. It turned very largely on a system of licensing to trade.

Q. On local enquiry it was found that a large number of people engaged in mica were against the bill. It is very difficult to make effective suggestions of this kind made by the industry and not supported unanimously by the industry?—A. The difficulty will always be there. The people whose business is based on stolen mica do not ask any questions and any bill that is brought in is bound to meet with opposition.

Q. Did your bill depend on the shifting of the onus of proof?—A. I do not think it did entirely.

Q. Supposing you had special legislation shifting the onus of proof, to what area would you propose to apply it?—A. To the whole of the mica area in the district of Hazaribagh, Monghyr and Gaya.

Q. And also Nallore?—A. I cannot say.

Q. You realise that this shifting of the onus of proof is a very serious departure from the ordinary principles of criminal law? It is said to be justified in South Africa because of the enormous relative importance of gold and diamond industries there, to which the mica industries of India bear no proportion whatever?—A. That is true. But mica is a key industry now. I am now acting for the Government of India for the collection of certain qualities of mica. They are of enormous importance. It is small in production but valuable in price. Of course I cannot say that the actual production is at all comparable with gold and silver or diamonds, but at the same time in its way it is equally important. As the electrical industry increases, still more care will be required to safeguard the mica industry.

Q. At present the difficulty is that an individual mine is not very concentrated. I mean all the workers do not go out by one or more ways which you can control and where you can search people when they go out?—A. That can be done. It might have some effect, but very very small, because a great deal of mica is actually stolen at night and it is impossible to guard every mine like that.

Q. Supposing, in addition to the suggestion made by the President as regards the transport of mica from the mica area, there is a rule that no one will be allowed to mine without a license, will that have a preventive action?—A. I think it would. Suppose a man has license for a mine and he still receives mica stolen from other mines I do not see how you are going to check it.

Q. But this would only get at the man who is obviously holding a bogus mine simply to receive stolen mica?—A. What about people who have not got mines at all, but who are merely dealers?

Q. The mines on the Government land are held under the mining and prospecting rules. The mines in the zemindari are not held under prospecting or mining leases, but simply leases from the zemindar?—A. In the case of leases that we have, they are leases for the mining rights of mica from the zemindar.

Q. Suppose the Government took up the mining rights from the zemindar so as to prevent a man from having a bogus mine? What are you going to call a mine?—A. If you go as far as the limit laid down by the Mines Act, it is 20 feet.

Q. What about all those pit holes under the 20 feet?—A. From these you can get quite a large amount of mica sometimes—I mean honestly.

Q. You could not discriminate the notorious receiver?—A. It will be very difficult. You may know all the notorious receivers and have a very shrewd suspicion that they are indulging in this particular kind of trade and I think it is very difficult to furnish sufficient proof to secure a conviction. I think the President's idea is quite sound, and it ought to be backed up by the shifting of the onus of proof. That is the only real way of controlling the thing.

President.—Q. The only suggestion which appears to me so far to be practicable is narrowing the channels of outlet; we might have one or two local agents, who can ascertain from the local gossip which are the doubtful exporters of mica. That might have a good moral effect?—A. I fully admit that in ordinary circumstances it must be most unjustifiable to shift the onus of proof. The reason of the suggestion was because something like that was required, and it is not a new thing entirely.

Q. Some system of money deposit system would keep out a lot of undesirables?—A. Not from earning a living, but from earning what they have hitherto been getting.

Q. You think it is possible for the Association to consider the suggestion that there should be one or two licensed depôts, and that no mica should leave the district except through these depôts. Would that interfere with the freedom of the individual and would it interfere with the trade?—A. I do not think so. I will put it before the Association.*

Q. You also complain that there is no suitable inspector of mines to control the mining operations in the district?—A. Yes.

Q. The present arrangement is that one of the ordinary inspectors of mines visits the district now and then?—A. Yes. About once a year, or when there is an accident he comes up.

Q. Consequently he does not see much of the mica trade and mica methods as a whole?—A. No.

Q. Do you think that the industry is big enough to warrant the Government appointing a first class inspector to control mica only?—A. I should think so.

Q. What is the value of the mica exported from Hazaribagh district including Monghyr?—A. I cannot tell you at present. I can give you that if you wish afterwards.

Q. Most of your mica comes from the zemindari tracts?—A. About one-half. At present we are doing more work in the Government forest than in the zemindaris. For various reasons we are not developing the property in the latter.

Q. When you are dealing with questions in the Kodarma forest generally, you have to deal with the forest ranger? He controls the mica mining operations?—A. No, only as far as the cutting of timber for mining work and for the carriage of machinery through the forest are concerned.

Q. He will have nothing to do with inspecting your mines?—A. No.

Q. Who controls your returns for royalty? Who inspects your accounts with regard to the quantity of output?—A. We do not pay royalty.

Q. Don't you on the Government land?—A. We pay dead rent. Royalty was tried about 8 or 9 years ago and it was found to be a hopeless failure. After nine years of smooth running they want to try it again, which would be a mistake.

Mr. C. E. Low. Q. About the question of having an Inspector to instruct people in proper methods, there is some dispute as to what are proper methods?—A. The best way is simply to say, mining methods so far as they are applicable to mica. There are lots of people who are mining who simply mine for the present and not for the future.

Q. My point is this, would you not have difficulties if you do not let a mine owner take the responsibility for the methods in which he is carrying on his mining from the point of view of production?—A. Supposing in consequence of the advice given to him by the instructing Inspector he undergoes a big loss, is Government to be liable?—A. I do not think so. I do not see why Government should be liable. It is not Government fault.

President.—Q. Do you think that anything would be gained if we suggested to Government that an officer be placed on special duty for, say, one season, to examine the whole state of affairs in this area with regard to mining and discuss the matter with your Association and to report to Government, making proposals with regard to control of the industry in future? It would be difficult for us to form a clear appreciation of the local circumstances. It is obviously a variegated picture. There are some people who are quite willing to work honestly and in the best interests of the country, and there are others apparently with no regard to the future of the industry?—A. It would certainly be a good thing to have Government on their part send out a man to make a local enquiry.

Q. Has there been any such local enquiry made?—A. I have not heard of one. I take it the enquiry will be not only of the actual working and the method of working the mine, but the local conditions generally, because local conditions are a very important point. Road communications are bad; for instance, in the Kodarma forest, there are two roads and the Forest department allow Rs. 200 a year for the maintenance of these roads. The roads are under the Forest department.

Q. The Forest department is not expected ordinarily to make roads except for the purpose of carrying forest produce?—A. This road is not under the District Board but under the Forest department, and I think they get two or three times as much income from mica leases as they do from timber, and another thing is that the timber can never be worth much because the country is far too stony and rocky. I would not go so far as to say that the whole forest should be absolutely cut down straight away, but they should relax their present methods and support the mica industry much more, as it is their main source of support.

Hon'ble Sir F. H. Stewart.—Q. I gather your Association has not been able to devise any regulations or restrictions that they would recommend to be imposed on the industry?—A. We have merely agreed on the various points we have brought forward. In my particular case I have written the report as merely showing the existing conditions and giving a general outline of what might very well be introduced to put things right. That is the line I have taken. I do not know how far Government will be able to assist in the matter. Supposing we have a whole set of regulations and so forth, are Government going to take a real interest in it?

Q. About the inspector, you would have a man of very wide powers. Would you accept his decision?—A. You mean as far as the actual mining is concerned?

Q. Yes.—A. It is just a question of consultation. As long as we are conserving the mines he has an easy time. It will be in the case of the people who are not conserving the mines that he will have to insist upon certain methods of working after he is thoroughly acquainted with all local conditions. The mica industry is going through a change now. Mica was practically all on the surface and in the old days very little mining was done from a mining point of view. All these surface deposits have been practically worked out.

President.—Q. Somebody suggested that we ought to create villages in the reserved forest. Is that essential on behalf of the mining industry?—A. It will be a great benefit.

Q. Have the work people long distances to go to the mines?—A. I believe they have. Our mining engineer will be able to tell you more about this.

Hon'ble Pandit M. M. Malaviya.—Q. You say that the theft of mica has grown to alarming proportions. What is the extent to which it is stolen?—A. About 50 per cent. of our output.

Q. From the mica mines on Government land and private land?—A. Yes.

Q. On what basis do you say that it is about 50 per cent.?—A. There are various people who do business in mica but do not mine themselves, and we know pretty well what we have lost.

Q. Is there not any check upon the output of mica from any particular mine?—A. Under the present conditions there is no check.

Q. Don't you know roughly what amount of mica you have taken out of the mine?—A. We can roughly, when it is being taken out, when our coolies leave the mine and take mica to the mine godown.

Q. Is there no surveillance on the coolies when they go out of the area in which they are working?—*A.* It is absolutely impossible. You cannot do it. I heard of a case the other day. The Sub-Inspector caught a man but nobody came forward to claim the mica. That man had to be let off with his packet of mica. How can one know that the mica came from any particular mine or mines?

Q. You recommend the appointment of a special Inspector of Mines who should have received education in mining engineering?—*A.* Yes.

A. Is there any school at present in the country where mica mining is taught?—*A.* I do not know of one.

ADDITIONAL WRITTEN EVIDENCE.

(Submitted after oral examination.)

I am in receipt of your letter No. 3424 of the 18th June on the subject of the adoption of a limited number of agencies to receive mica for transport out of the district so as to remove the present practice of mica thieving.

As agreed I have placed this matter before the Association in the light of Sir Thomas Holland's suggestions but the opinion is that the existence of such Custom Clearing Houses would not be any check on the present practice of mica thieving. The reason being that such a check as these Custom Clearing Houses would effect is at a point which is beyond the actual stage at which the principal amount of thieving takes place.

For instance, supposing two persons called "A" and "B" were dealing in mica. "A" has regular working mines of his own from which he derives his output honestly. "B" is a man who has nominally a small mine but is able to keep up a fairly steady output by means of some arrangements with some of the coolies and sirdars in the service of "A." How would it be possible for the officers in charge of such Custom Clearing Houses to detect the fact that any of B's mica came from A's mine? It would be impossible to detect it.

It may be argued by those who are not thoroughly conversant with all the local conditions of mica mining that it is up to "A" to prevent the mica from his mine from going elsewhere, but this is not practicable owing to the fact that mica deposits are not confined to a limited number of mines such as could be provided with a reasonably reliable guard to prevent mica going astray, but they appear all over the country-side and most of the deposits are not in themselves large enough individually to make it practicable to maintain such a force of reliable guards and are moreover largely situated in the heart of dense jungle where tigers and leopards abound.

The main point is in the existence of the receivers of stolen mica and as long as they exist and create a market for stolen mica, mica will continue to be stolen.

From the above it will be seen that any check that could be exercised at the point where the mica leaves the district is too far along the line as the trouble does not occur at that point but at the point where the mica is taken from the ground.

At a second meeting which was held for the purpose of discussing this particular subject, I was instructed by the Association to procure a copy of the mining rules now in force in Mysore for gold and it has been generally agreed that the Mysore Mines Regulation, 1906, clauses 5, 6, 7, 8, 9, 10 (1), 10 (2), 10 (3), 11, 12, 13, 14, 15, 16, 17, 19 and 20 would possibly meet the needs of this present situation in mica.

I enclose a copy of the clauses and sections, etc., referred to, for your information.

It is not improbable that this matter will be discussed still further in the light of these Mysore rules and if any further decisions are arrived at, I shall be pleased to let you know, but at the same time, I do not anticipate much alteration in the views of the Association on this subject as the principle adopted in Mysore seems to be the only one which is likely to be of any practical benefit to mica miners in the suppression of mica theft.

MYSORE MINES REGULATION, 1906.

<i>Clauses applicable to Gold in Mysore</i>	<i>Clauses as amended applicable to Mica.</i>
<p>CLAUSE 5.</p> <p><i>Mining materials not to be purchased, conveyed or kept without written permission.</i>—No person shall purchase or take in barter or exchange any mining material belonging to a Mining Proprietor without the written permission of such Mining Proprietor or his Superintendent, nor shall any person, without such written permission, receive, convey, or, except in such places as may be specially authorized, keep, any such mining material otherwise than for use for mining purposes on behalf of such Mining Proprietor or his Superintendent.</p>	<p>No alteration.</p>

MYSORE MINES REGULATION, 1906—*contd.*

Clauses applicable to Gold in Mysore.	Clauses as amended applicable to Mica.
<p style="text-align: center;">CLAUSE 6.</p> <p><i>Penalty for unlawful possession of mining materials.</i>—Any person found to be in possession of any mining material without the written permission of a Mining Proprietor or Superintendent, and unable to prove that his possession of the same was obtained in a lawful manner, shall, on conviction before a Magistrate, be liable to the penalty provided in section 13.</p>	<p>No alteration.</p>
<p style="text-align: center;">CLAUSE 7.</p> <p><i>Licenses required for gold dealers and goldsmiths.</i>—It shall not be lawful for any person to buy or sell unwrought gold or to receive unwrought gold by way of barter or pledge without a gold dealer's license, nor to carry on the profession of a goldsmith without a goldsmith's license as hereinafter provided.</p> <p>Provided that it shall not be necessary for a Mining Proprietor to take out a goldsmith's license on account of the smelting, refining or other preparation of any gold obtained from his mine by any persons acting on his behalf.</p>	<p>It shall not be lawful for any person to buy or sell mica or to receive mica by way of barter or pledge without a mica dealer's license, nor to carry on the profession of mica without a mica dealer's license as hereinafter provided.</p> <p>Unnecessary.</p>
<p style="text-align: center;">CLAUSE 8.</p> <p>(1) <i>Power to grant a license.</i>—The licenses referred to in section 7 may be issued by a Magistrate of the First Class on payment of such fees as the Government may by rule prescribe in that behalf, and every license shall terminate on the 31st day of December of the year in which it is issued.</p> <p>(2) Every gold dealer's and every goldsmith's license and every application for a license, shall, respectively, be in such forms as may be prescribed by Government.</p>	<p>No alteration.</p> <p>Every mica dealer's license and every application for a license shall be in such forms as may be prescribed by Government.</p>
<p style="text-align: center;">CLAUSE 9.</p> <p><i>Power to cancel a license.</i>—No license shall be issued to any applicant unless the Magistrate is satisfied that he is a person of good character and reputation, and it shall be in the absolute discretion of the Magistrate to grant or withhold such license as he may think fit. Any license may be cancelled by a First Class Magistrate on the licensee being convicted of any offence—such conviction not being reversed on appeal or in revision— which in the opinion of the Magistrate renders him unfit to hold a license. Provided that any decision under this section by a Magistrate other than the District Magistrate shall be appealable to the District Magistrate, whose order shall be final.</p>	<p>No alteration.</p>
<p style="text-align: center;">CLAUSE 10.</p> <p>(1) <i>Books to be maintained.</i>—Every licensed gold dealer shall keep at his place of business a book (hereinafter called a gold dealer's register) in which the receipt or disposal of all unwrought gold shall be immediately entered in such form as may be prescribed by Government.</p> <p>(2) Every licensed goldsmith shall keep at his place of business a book (hereinafter called a goldsmith's register) in which the receipt or disposal of all gold, silver, gold or silver jewellery, unwrought gold or other gold stuff, received, treated, or disposed of by him shall be immediately entered in such form as may be prescribed by Government.</p> <p>(3) Every gold dealer's register and every goldsmith's register together with any article or items of gold referred to therein and in the possession of the licensee shall be open to inspection at any time by any police officer not below the rank of Chief Constable, or any police officer specially authorized in this behalf by the Superintendent of Police or by a First Class Magistrate; provided that the person making such inspection shall not divulge the result thereof to any person other than a police officer or Magistrate or by order of a court, under a penalty on conviction not exceeding one hundred rupees.</p>	<p>Every licensed mica dealer shall keep at his place of business a book (hereinafter called a mica dealer's register) in which the receipt or disposal of all mica shall be immediately entered in such form as may be prescribed by Government.</p> <p>Not applicable.</p> <p>Every mica dealer's register in the possession of the licensee shall be open to inspection at any time by any police officer not below the rank of Chief Constable, or any police officer specially authorized in this behalf by the Superintendent of Police or by a First Class Magistrate; provided that the person making such inspection shall not divulge the result thereof to any person other than a police officer or Magistrate or by order of a court, under a penalty on conviction not exceeding one hundred rupees.</p>

MYSORE MINES REGULATION, 1906—*contd.*

Clauses applicable to Gold in Mysore.	Clauses as amended applicable to Mica.
<p align="center">CLAUSE 11.</p> <p><i>Goldsmiths not to deal with gold, etc., until after three days' receipt.</i>—No licensed goldsmith shall smelt, work, use or deal with any of the articles directed to be entered in his register under section 10 until after the expiry of three clear days from the time when such article is received by him. Provided that this section shall not apply to the repairing of articles of jewellery by a goldsmith in any way which does not change or destroy the identity of such articles.</p>	Not applicable.
<p align="center">CLAUSE 12.</p> <p><i>Possession of unwrought gold unlawful except in certain cases.</i>—It shall not be lawful for any person to have in his possession any unwrought gold unless he holds a gold dealer's license or a goldsmith's license or unless he is a Mining Proprietor or duly accredited person acting on behalf of a Mining Proprietor.</p>	<p>It shall not be lawful for any person to have in his possession any mica unless he holds a mica dealer's license or unless he is a Mining Proprietor or duly accredited person on behalf of a Mining Proprietor.</p>
<p align="center">CLAUSE 13.</p> <p><i>Penalty for breach of section 5, 6, 7, 10, 11 or 12.</i>—Any person committing an offence under section 5, 6, 7, 10, 11 or 12 shall, except in the case mentioned in the proviso to sub-section (3) of section 10, be liable on conviction to fine not exceeding five hundred rupees, or imprisonment of either description for a term which may extend to one year, or both.</p>	No alteration.
<p align="center">CLAUSE 14.</p> <p><i>Substitution or addition of whipping in certain cases.</i>—It shall be in the discretion of the Magistrate, in the case of any person, not being a female or other person exempted under section 393 of the Code of Criminal Procedure, who shall be convicted of a second offence under section 5, 6, 7 or 12, to award whipping under the provisions of the Mysore Whipping Regulation V of 1903, either in substitution of, or in addition to, the penalty provided in section 13.</p>	No alteration.
<p align="center">CLAUSE 15.</p> <p><i>Power to search.</i>—Any police officer, not below the rank of an officer in charge of a police station, may search any person or any house, building or place for the discovery of any mining material, unwrought gold or other thing with, or in respect of, which an offence under this Regulation is reasonably suspected to have been committed.</p>	<p>Any police officer, not below the rank of an officer in charge of a police station, may search any person or any house, building or place for the discovery of any mining material, mica with, or in respect of, which an offence under this Regulation is reasonably suspected to have been committed.</p>
<p align="center">CLAUSE 16.</p> <p><i>Liability of tenant or occupier of premises in regard to unwrought gold or mining material seized therein.</i>—Any person being the tenant or occupier or reputed tenant or occupier of any premises, at the time when any unwrought gold or mining material reasonably suspected of being stolen or unlawfully obtained is found thereon and seized by any police officer, shall be deemed to have been in possession of such unwrought gold or mining material within the meaning of section 12 or 6, as the case may be, until he proves the contrary.</p>	<p>Any person being the tenant or occupier or reputed tenant or occupier of any premises, at the time when any mica or mining material reasonably suspected of being stolen or unlawfully obtained is found thereon and seized by any police officer, shall be deemed to have been in possession of such mica or mining material within the meaning of section 12 or 6, as the case may be, until he proves the contrary.</p>
<p align="center">CLAUSE 17.</p> <p><i>Liability of undesirable person to be ordered off any mine or cooly colony.</i>—The Superintendent of Police for the Kolar Gold Fields may, by order in writing, direct any person, whose residence within such area as may be notified by Government from time to time is considered undesirable, to quit the said area within twenty-four hours and such person shall not, after the lapse of the said time, remain at or re-enter the said area without the permission of the said Superintendent of Police.</p>	<p>The Superintendent of Police for the districts of Hazaribagh, Monghyr and Gaya and corresponding officials in Calcutta may, by order in writing, direct any person, whose residence within such area as may be notified by Government from time to time is considered undesirable, to quit the said area within twenty-four hours and such person shall not, after the lapse of the said time, remain at or re-enter the said area without the permission of the said Superintendent of Police and corresponding officials.</p>

MYSORE MINES REGULATION, 1906—*conold.*

<i>Clauses applicable to Gold in Mysore.</i>	<i>Clauses as amended applicable to Mica.</i>
<p>CLAUSE 19.</p> <p><i>Penalty for breaches of section 17.</i>—Any person committing any act prohibiting under section 17 shall be liable on conviction to fine not exceeding one hundred rupees or imprisonment of either, description for a term not exceeding three months or both.</p> <p>CLAUSE 20.</p> <p><i>Cognizability of offences by the Police.</i>—All offences under sections 5, 6, 7, 10, 11, 12, 16, 17 of this Regulation shall be cognizable by the police.</p>	<p>No alteration.</p> <p>No alteration.</p>

WITNESS No. 91.

Mr. E. Lane.

MR. E. LANE, *Mine Manager, the Chota Nagpur Mica Syndicate, Ltd., Kodarma, Hazaribagh District, Chota Nagpur.*

WRITTEN EVIDENCE.

Mining and
Prospecting Rules
(1918), Mining
Leases.

With reference to the clause in the new mining lease in the proposed model form of lease for mica in which a royalty of 5 per cent. *ad valorem* may be levied in lieu of a dead rental of Re. 1-8 per acre, I beg to state that the royalty system is quite unsuited to the mica industry and will simply lead to fraud. In fact it may be compared morally with the income tax and the personal tax in municipalities—because there is no possibility of checking the quantity or value of the lessee's output except at an impracticable expense on officials and great interference with the work of mining. It presents a great temptation to actual dishonesty and even to the most scrupulous lessees it presents practical difficulties in calculating values fairly between themselves and Government. To the extent that the dishonest evade payment it constitutes a trade preference in favour of the dishonest of a grossly unfair kind.

Forest Department.

Q. 105.—There is only one road leading through the Kodarma forest and it was made about 20 years ago. The other so-called roads through the forest are only rough tracks along which even the primitive sagar (village cart) can with difficulty travel. The main road is so ill-kept as to be practically useless for any wheeled traffic except bullock carts. The reason is that the Forest Department would not give enough money for the maintenance of the road. They have not made a new road in this forest as far as I am aware for over 20 years.

The present annual revenue accruing to the Forest Department from the mica mines is about Rs. 32,000. The total amount of money spent by them on the upkeep of the road and tracks in the forest is about Rs. 200 annually.

The want of proper communications throughout the forest is a very serious hindrance to the development of the industry. Roads are urgently wanted.

Mica thefts.

As the police seem unable to prevent these it is time the law relating to theft of mica was changed. At present a cooly may be caught carrying mica which he has stolen—in fact several instances have occurred in which the police have arrested coolies with stolen mica in their possession but as no one claimed the said mica, it being impossible to identify it, the culprits were released.

The law as it stands at present lays the onus of proof on the prosecution but in the case of mica it is, as I have stated above, impossible to identify mica.

What is wanted is that the Calcutta and Howrah law which insists that the onus of proof rests on the suspected person should be brought into force in the mining area.

ORAL EVIDENCE, 30TH NOVEMBER 1916.

President.—Q. You say that what is wanted is that the Calcutta and the Howrah law which insists that the onus of proof rests on the suspected person should be brought into force in the mining area. I do not quite understand the expression. I have not heard of the Calcutta and Howrah law. What is this?—A. There is a special police bye-law in force in Calcutta.

Q. The onus of proof is on the suspected person?—A. Yes, in Calcutta any person suspected of carrying stolen property may be stopped by the police. A Policeman told me this some time ago.

Q. In the case of gold mining and diamond mining the operations are limited to a small number of fairly large concerns and it is consequently easy to narrow the issue with regard

to the origin of either the gold or the diamonds. But in the case of mica mines I understand that there are so many small concerns that it is impossible to apply any law of the kind. The concerns are so small that anybody might be a mica thief in a small way?—A. Quite so.

Q. So that you cannot suggest any way by which this thieving can be prevented except by reversing what we regard as a very important principle of justice, that is, throwing the onus of proof on the suspected person. It will be a rather difficult thing to do?—A. I suppose so.

Q. Can you suggest any other way of avoiding this difficulty?—A. Every miner should have a license.

Q. License for what?—A. To prove he is entitled to carry the mica. Every workman should have a ticket with the name of his employer or company and his own number and the mine in which he is working on the ticket.

Q. What would prevent the man who is carrying a pass from handing it over to another friend who is not justified in carrying it?—A. The only way is to make the Sirdar of a gang of workmen responsible for his men's tickets and he should be made to deposit a substantial security.

Q. Would it be possible to limit the number of men who are authorised to carry mica in the open areas from the mine?—A. It would not be possible.

Q. Would it be possible to prevent mica being carried at night?—A. It would be difficult as the Kodarma forest has so many outlets.

Q. What I mean is would it inconvenience the honest industry if we prohibit the carrying of mica at night?—A. Yes, because in the hot weather the mines are often worked at night.

Q. You do not think this is practicable?—A. No; it is not practicable for the reason given above.

Q. Practically this thieving is done at night?—A. In the day too. But most of it takes place at night.

Q. The difficulty is to control it at night and you say that it would be inconvenient to have a Government regulation preventing the carrying of mica at night?—A. Yes, because of the reason already given.

Q. We want rules of such a kind that they will reduce the amount of thieving and at the same time not seriously interfere with the work of honest mining. What hours can you suggest?—A. Fixing of hours will make no difference. If a man wants to steal he will make opportunities. The remedy for the evil lies in giving heavier sentences for mica theft; at present the sentences given are ridiculously light.

Q. Can't you re-arrange the day so that you could get your coolies in by day-light?—A. We are dependent on a class of labourers who are cultivators and they attend to their fields in the mornings and go to the mines afterwards. So that the work has to be carried on till late in the afternoon.

Q. Cannot you have certain number of coolies who are registered and who could be provided with passes?—A. That ought to be done.

Q. I am asking you these questions because if you are making a complaint against mica thieving you must undertake to put up with a certain amount of inconvenience, that is to say, a certain amount of disturbance of your present habits if you are going to facilitate anything like Government regulations?—A. Quite so.

Q. What I want to obtain is something like practical suggestions. We have really none so far. We have seen a draft Act sent up to the Bihar and Orissa Government, but on local enquiries being made they found that a large number of mica mines are against the Act rather than in favour of it. In those circumstances it is very difficult for us to Act?—A. The Government should hold a conference with the leading mica firms and draw up legislation which is broadly suitable and reasonable and then insist on all the firms and lessees carrying it out.

Q. Do you think there are any mines which would not loyally carry out such regulations?—A. I cannot say that.

Q. Could we control the issue of the passes to men who carry mica at night? It would obviously be in the hands of the mining men themselves. Can they be trusted?—A. I believe people in the Kodarma mining area can be trusted but I know nothing about the zemindaries.

Q. That is where the difficulty comes in. Would it not be simpler to have a uniform order preventing the carrying of mica at night?—A. The legislation should apply to the entire mica field and industry without exceptions.

Q. It has been suggested that mica thieving can be largely stopped if we had a regulation of this kind, namely, the establishment of one or two receiving depôts in the district and an order that no mica was to leave the district except through these depôts?—A. Yes, this would be an excellent system if the official-in-charge of the receiving depôt was a trustworthy and capable man.

Q. A great deal of mica does not pay royalty at all coming out of zamindaries. Would it interfere with the trade as a whole if Government passed a regulation that no mica was to leave the district except through certain registered depôts?—A. It would not interfere with the trade and private persons owning properties should be reasonable and loyal enough to submit to the same legislation as their fellow-workers in Government fields.

Q. Are you a member of the Kodarma Mining Association?—A. Yes.

Q. Can your Association discuss that question and produce something like a practical scheme?—A. I shall place it before the Association.

Q. I have asked Mr. Cockburn* the same thing but I want to know from you whether there is any *prima facie* difficulty in the way. Is it worth while your considering it?—A. I think it is.

Mr. A. Chatterton.—Q. I cannot understand what is the difficulty. You have a mine working over a scattered and a considerable area and are not your coolies mining under supervision?—A. Yes, they are mining under the supervision of sirdars who were coolies themselves before they were promoted and are more or less in league with their coolies. This is the only supervision that it pays us to employ except in the case of a few of the larger mines.

Q. When they stop work they bring their mica in headloads to the godown?—A. Yes.

Q. And those godown are at a considerable distance?—A. Sometimes as far as seven miles.

Q. Do they get any bonus on results?—A. No. They do not.

Q. Most of the theft occurs between the mine and the godown?—A. Yes, but in many cases the mica is taken out of the mine at night by gangs of thieves who overawe the guards in charge.

Q. Is the mica weighed at all before it leaves the mine?—A. It is not weighed at the mine at all.

Q. How do you know that the mica is stolen or not?—A. By the disappearance of the crystals that were left showing in the mica reef at the close of the previous day's work.

Q. Is it practicable to work the mine in the dark?—A. No, not in the darkness but the thieves have lights.

Q. Do you not have subsidiary godowns near the mine?—A. In a few cases, but as a rule the godowns is some distance away from the forest for fear of forest fires often caused by the coolies cooking their food.

Q. Would it not be possible to have an iron safe which is not very bulky?—A. We could do that but we have got such a number of small mines that it would be very expensive to do this. Moreover the mica is stolen before it is taken to the godowns.

Q. You could use one godown for a radius of a mile round?—A. One godown has to receive the mica not from one mine only but from a group often several miles apart.

Mr. C. E. Low.—Q. Mr. Cockburn made a suggestion that Government mining engineers should be employed not only to carry out the present functions of the Mines Inspectors but also to compel and advise mine owners to work on sound lines. Do you consider that would be a good policy?—A. I do. I think it would be a very good policy if we had some professional men to give lectures once a week or once a fortnight to the managers and assistant managers of the various concerns.

Q. I was not alluding to that sort of instruction. I was alluding to the idea of mining engineers coming round and enforcing the carrying out of operations in a particular way?—A. I think it would be a very good idea to be able to get advice from them. One wants advice at times.

Q. Should it be advice or order?—A. Advice.

Q. You would not like, for instance, a Government mining engineer coming round and saying that this is not the right way of working the mines?—A. I would rather get his advice than be under his orders.

Q. Do you think it would be a good thing to have the scope of these inspectors' duties extended in the matter of greater interference?—A. We do not want any interference. But we want advice, a man whom we can consult when we have a difficult piece of work on hand.

Q. Do you think that the ordinary consulting engineers would object to that sort of entry by Government into the field of advising?—A. They may object from the point of view of their private interests, but I don't see why they should dictate to Government in matters where the public interest is at stake.

Q. Would you have the Government mining engineer advising in individual cases or would you confine him to lecturing and general demonstration purposes?—A. Let him do both.

Mr. A. Chatterton.—Q. Is the mining done very extravagantly?—A. It has been done very extravagantly in the past. But we are getting more careful. We are having scientific mining now.

Q. Would it not be possible and justifiable if Government appointed an inspector to inspect the workings of the mines and to see that no wasteful methods were adopted?—A. We have an Inspector of Mines already. He comes and inspects the mines.

* *Vide* Additional Written Evidence of Mr. Cockburn, Witness No. 90, printed after his oral evidence.

Q. How often?—A. Sometimes two or three times in a year.

Q. He inspects the bigger mines?—A. He comes up and enquires into accidents whenever they occur and in the cold weather he comes on tour.

Q. Would it not be possible to introduce a better system of mining so as to secure a larger production and less waste? The methods adopted by the Indian miner are often wasteful and uneconomic. Would it be desirable if the owner of a license who is working in bad way, and with wastage were put to restrictions and made to work it in better ways?—A. That ought to be done.

President.—Q. You refer to the royalty system of 5 per cent. and the levy of a dead rental of Re. 1-8-0 per acre. Do you think that the new system is as good as the old one?—A. The new system of royalty is not satisfactory. It gives us much trouble. They give us countless forms to fill in and Government wants the returns of sales every six months which we cannot give as the mica is often not sold in London for a year or longer.

Q. I think you are talking of the old system under which you paid royalty at 5 per cent. on the local value?—Q. Yes.

Q. And now you pay Re. 1-8-0 an acre and no royalty. Surely this is the simpler system?—A. Yes, that is the method we want. In the new form of lease they want to do away with the dead rental and impose royalty.

Q. Is it correct that you now pay Rs. 1-8-0 an acre and is it not correct that some years ago you used to pay 5 per cent.?—A. Yes.

Q. Is not the system of dead rental satisfactory?—A. Yes.

Q. Why do you think the Government want to alter this?—A. Because they want more revenue from the mines they have sent a letter to the Association discussing about introducing the royalty system.

Q. When did they write?—A. In October 1916.

Q. Have the members of your Association complained of the system of charging Re. 1-8-0 an acre?—A. No.

Q. Have you any idea as to why Government are contemplating this change?—A. Because Government consider that they might obtain a higher revenue under the royalty.

Q. Why not raise the rent to Rs. 2 then?—A. I have proposed to raise it to Re. 1-12-0 to the Commissioner of the Division.

Q. Your Association would like to have an increase of the dead rental rather than a reversion to the system of royalty?—A. Yes. Because the royalty system entails incessant and vexatious examination of accounts which are generally carried out by subordinate officials.

Q. The Government have not indicated their intention to revert to the royalty system?—A. Yes. Government have indicated their intention of reverting to the royalty system if they are satisfied that it is necessary.

Q. Government may be enquiring into the working of the present system. Have they told you that it is their intention?—A. They say that unless we can prove that Government is not losing money by the transaction they shall revert to the royalty system.

Q. That is a different matter and your way of proving it is by offering the enhanced rate of Re. 1-12-0?—A. I believe Government officials find it difficult to obtain true returns from the majority of the mica firms and from private lessees.

Q. I do not think you need worry about it. The Government is obviously trying to find out whether after a certain number of years during which this system has been on trial they are losing money. That is a very fair enquiry?—A. Yes.

Q. If the Government finds that they are losing money you would no doubt be prepared to come up to the old standard of revenue?—A. Yes. But we want to avoid annoyance and interference. Minor officials come now and again and inspect the books.

Q. Do you think that the acreage system is working satisfactorily?—A. Yes.

Q. You are willing to submit to a readjustment of rates so that the Government may not lose. If the mica mining goes down the Government will suffer like you?—A. Yes.

WITNESS 92.

MR. HERBERT J. SPARKS, Consulting Engineer, F. F. Chrestien & Co., Ltd., Mica Mines, Mr. H. J. Sparks, Domchanch, Bihar.

WRITTEN EVIDENCE.

The questions set forth for the guidance of witnesses are only applicable to the mica mining industry in one or two instances. Where such questions are directly touched upon in this statement they are indicated by marginal references.

The war has rather suddenly revealed the importance of the mica industry, not only to particular localities of India but to the whole manufacturing world and the British Empire in particular, since mica is a prime necessity in the manufacture of electrical

paratus of nearly every kind while the deposits that at present supply the world's demand for the most part, within the confines of the British Empire and this country above all. It is these facts that have induced, as I understand, an inclination in the home authorities to regard mica mining and the subsidiary industry, the manufacture of micanite as "key industries" calling for special treatment.

While India is favoured by fortune in having at least two fields of considerable size and richness, in the Hazaribagh District of Bihar and Orissa and the Nellore District of Madras, it must be confessed that the value of these fields and the importance of their conservation have barely yet been appreciated so that a great waste of mineral wealth has already occurred. This waste can be directly attributed to the lack of system and method that characterised the mining business for so many years—and is still, I am afraid, its distinguishing hall mark—and the apathy of Government in allowing such a state of affairs to continue unchecked. Many a vein of yet potential value at depth, worked to the limit of profit with human material only, lies gutted and derelict with pillars cut and roof fallen in. To re-open such mines is a work demanding skill, capital, and time.

If superstition, prejudice, and rule of thumb are allowed to continue their destructive methods, then to my mind, it is only a question of time, and a limited time, before the mica deposits of Hazaribagh and Nellore will be entirely ruined (except for such portion of them as may be held by concerns who pursue methodical mining tactics) with the inevitable result that the leading position at present enjoyed by India would pass to other countries, and possibly outside the Empire. On the other hand, judicious control by Government in the future development of our mica-bearing fields should go far towards maintaining and improving India's position in the world's markets for an indefinite time.

No doubt there were economic excuses for the slipshod hand-to-mouth methods of mining adopted in the earlier days, but the cogency of those excuses, such as it was, is now passing away as surface deposits, with their supplies of cheap mica, become gradually exhausted and the need of deep mining becomes more and more insistent to find the mica called for by the market.

However favourable market conditions may be, and on such a subject it is impossible to prophesy, the transition from methods of reckless waste to methods exactly contrary is bound to be a period of difficulty.

Government can do much to tide the industry through this period, by judicious control and assistance. Having said the industry calls for control and assistance I now divide my statement into two parts and in the first I will endeavour to indicate how a measure of Government control can be made to prevent the premature destruction of deposits, while in the second I will try and show how Government can assist the enlightened and responsible miner.

Remarks applicable to the Hazaribagh District generally.

Part I—Control.

1. *Mining Rules.*—These should be drafted on lines more applicable to mica mining than the present regulations and these rules should aim at the prevention of destructive mining methods and not solely at safeguarding the workman, though the latter is, of course, of great importance. The rules should be drafted in consultation with experienced miners having knowledge of local conditions. The rules should be made applicable to all mica mines and not only to such as are held under Government leases.

2. *Inspector of Mica Mines.*—Under the present scheme of inspection genuine control is almost nil. The mines are visited about once a year and as the inspector has seldom much time at his disposal his inspection is apt to be unduly confined to the larger concerns whose operations, really, least require inspection. The men chosen as Inspectors seem to be entirely colliery-trained engineers who necessarily lack the capacity to appreciate the requirements of reef mining. The man appointed as inspector of mica mines should be a qualified mining engineer, with sufficient experience in *vein* mining to allow of his giving advice useful to a mica miner. To secure this the man should be attached for a twelve month to some mica concern so that he could appreciate to some extent the special needs and the point of view of the inspected through the varying seasons of the Indian year. This inspector should be provided with the powers necessary to see that the rules applicable to mica mines were honoured in the observance as well as the breach.

3. *Plans of Mines.*—A rule at present exists calling on all mine-owners to keep accurate plans but owing to the backward condition of the industry it has not been enforced. In my opinion it is a rule that should be insisted on in mines of any appreciable size and possibilities, as reliable plans of the mine workings are of the greatest value in re-opening abandoned mines as well as of collective scientific value in conveying information as to the behaviour of the veins. Both a plan and a section showing correctly the area and depth of the workings should be kept to a standard scale and copies should be filed with the inspector whenever a mine is abandoned.

Part II—Assistance.

At the best of times mica mining has been, and will continue to be, a hazardous enterprise. If to the ordinary risks is to be added the burden of the restrictions outlined above,

it will be necessary to afford assistance to the industry such as will encourage responsible parties to invest the capital and energy required to develop the industry on approved lines.

This assistance can take many forms :—the prolonged enjoyment afforded by long leases : supply of labour, skilled and unskilled : suppression of mica stealing : closer administration and improved communications : alteration of rules applying to Government forests and land-tenure : simplification of the terms of Government leases.

1. *Administration*.—Q. 110. Considerable assistance could be rendered to the industry in the District of Hazaribagh by bringing the mica fields into closer touch with its administrative and judicial machinery. Hazaribagh town, the District headquarters, is distant some fifty miles from Kodarma, while the sub-divisional town of Giridih is the same distance from the neighbouring field of Gawan. All cases have to go into these two towns for hearing, which, given the known penchant for delay and postponement in all Indian legal matters, is a cause of so great a waste of time and money as to amount to something like a denial of justice to miners in Kodarma and Gawan.

2. *Communications*.—Such feeder communications as there are in the mica area consist of roads. Of roads the lack is severely felt especially of a properly maintained District Board road to give secure and direct communication between the mines lying in what is known as the Kodarma field and those lying in what is known as the Gawan field. Such road communication as there is between these two fields is unnecessarily roundabout. In the matters, therefore, of administration and communications, I would suggest the desirability of treating the mica mining area as a magisterial centre, with headquarters at Kodarma, and the urgency, in any case, of knitting up the area with the necessary roads.

3. *Mica Stealing*.—This is the running sore of the mica industry and one that calls for prompt surgery if the business of *reputable* mica mining is not to expire altogether.

Illicit mica buying flourishes on a surprisingly large scale, mica being an article eminently saleable, of small bulk to conceal and practically unidentifiable.

The law of identification of stolen goods as it now stands and is applied is the palladium of mica stealing : persons having many times been caught red handed with mica to which they could have no possible right but, because the miner could not swear positively that the mica was his, prosecution has resulted in acquittal.

There are two parties to this illicit traffic ; the actual thief, who is generally a cooly, and the receiver, who is generally a mudi. The temptation to the cooly, is the fact that he can earn many times his daily wage by stealing mica and passing it to one or other of the receivers who pervade the whole district and ask no questions. The temptation to the receiver is the hope of gain coupled with the immunity afforded by the law of identification, an immunity enhanced if he is on the right side of the nearest policeman.

The only cure of this harassing and dangerous plague would appear to be the shifting of the *onus probandi* of the derivation of suspicious mica from complainant to defendant. Further, trading in mica should be permitted only under license from Government : this would probably reduce the obvious excess that now exists in the number of traders compared with actual miners.

4. *Skilled Labour*.—Q. 57. Skilled labour, as such is generally known in mining, does not exist in the Indian mica fields. The matter of some beginning of technical instruction is one I would urge on the notice of Government. As the mines are scattered over such a wide area it is difficult to suggest any means by which instruction in methods of mining can be conveyed to the overseers and mistries, etc., but possibly a scheme of simple lectures at various central points by the Inspector or other competent individual and the use of pamphlets and sketches would indicate a beginning. Technical education as it is applied in India appears to me to aim too high and to be of far too towering a nature for the foundation on which it is built. As mining is essentially a trade to be learnt only by practical experience, a form of apprenticeship would be a desirable avenue of instruction provided that any number of sufficiently educated youths could be found with enough force of character to face the existing conditions and to continue through the probationary stage. There would be undoubtedly ample scope for even partially trained men while a status could be given them by the institution of a simple examination for certificates as mica mine overseers.

5. *Unskilled Labour*.—This labour is drawn from the local inhabitants who are all petty cultivators with only a partial stake in the mining. The scanty and fitful attendance of this labour already constitutes a severe handicap. It does not seem possible to remove this handicap by a mere rise in the rates of pay, which tends rather to aggravate the malady, the cooly class being content, apparently, with a mere hand-to-mouth existence. The labour is inefficient and jealously conservative of old and wrong methods. I believe that emigration has been responsible for a diminution of such labour supply as there is, and I would urge, that emigration, and especially indentured emigration, should be discouraged.

Suggestions applicable to the Government Forest of Kodarma.

(a) *Roads*.—In the area of the Kodarma Forest it may be said no roads exist. There is one track from Kodarma to Debour, 10 miles long, which becomes almost impassable to wheeled traffic during the rains. There is another similar track roughly at right angles to this. Of feeder roads there are absolutely none. I understand that a sum of about Rs. 200

per annum is all that is allowed by the Forest Department, under whose control these tracks are placed for their upkeep.

(b) *Forest Preservation.*—Q. 105. Of the mines in the District of Hazaribagh of which Government is the landlord all, or nearly all, lie within the confines of the reserved Forest of Kodarma. This jungle tract covers what there is reason to believe is an exceedingly valuable mica belt. The undergrowth and rank grass of the forest must, presumably, still conceal a number of possible prospects.

I cannot claim any particular knowledge of forestry but the fact that the area consists largely of mica schist and pegmatite outcropping with a very thin covering of soil (where any exists) would seem to suggest that really big or valuable timber can never be grown. There are, however, a good number of sal trees of suitable size for mine props, and other timber essential to the miner; and, under Forest regulations, it is now impossible to obtain these as and when required. Other regulations prevent the centralisation of mine labour on the mines, a matter of increasing importance.

Nellore District.—The body of my statement is applicable to the Nellore District. The mica occurrences in this district differ considerably in their nature from those of Hazaribagh. In place of a rugged jungle surface with many exposed outcrops there is a flat plain very largely covered with a layer of laterite and more recent alluvium. A consequence of this formation is that prospecting has not been so widespread and that successful exploitation has been restricted to a comparatively small number of big mines. This is, in my opinion, the principal reason why mica stealing is not so much in evidence though the comparative immunity of the miner may also be due to the comparative honesty of the labouring element. Since, however, the penchant for theft now noticeable in the Hazaribagh field was not an indigenous growth but was introduced by traders, I consider that it would be advisable to make such regulations as may be beneficial in fighting the evil of general application as safeguarding the future from sporadic tendencies.

Communication. The roads in the Nellore District call for urgent attention. The major portion of the mining area is enclosed in a triangle of which three local fund roads form the sides. Two of these roads are intersected by rivers which are an obstacle to traffic at all times and periodically impassable in the monsoon season. The interior of the triangle has no publicly maintained roads of any sort. A good road is badly needed and could easily be provided to connect one corner of the triangle at Podalakur with the centre of the base near Sydapuram, a distance of about eleven miles, of which three to the Criminal Settlement at Kalichedu are already made. I understand that the necessary bridges were designed and sanctioned but the building was postponed indefinitely. I would urge that construction should be immediately proceeded with.

Forest.—There is an entire absence of all timber suitable for mine props in the Forest reserves within reach of the mining district. There is however a good deal of reserve consisting of stunted scrub and cactus which yields a certain amount of fire wood averaging perhaps from 3 to 5 tons per acre. Coupes are sold annually by auction but are generally bought by contractors for supplying the Madras market. These contractors form a ring and will not bid against each other but force up the price against the miner. As the district is at a great distance from any coalfield the question of fuel is a serious one and I would suggest that coupes within five miles of any mine be reserved for miners at a small royalty per ton of fuel yielded per coupe.

Regulations.—The need for special rules for mica mines is felt as much in Nellore as elsewhere; if anything, owing to the lack of timber, destructive methods have gone to even greater lengths than in the Hazaribagh District. The system of tenure is different in that royalties are paid instead of rent and the scale of royalties contains some anomalies which need correcting. The system is not one which commends itself to the miner as it involves considerably more decentralisation and the maintenance of otherwise unnecessary staff.

ORAL EVIDENCE, 30TH NOVEMBER, 1916.

President.—Q. What experience have you had of mica mining before coming to India?—A. None. I was on gold-mining before.

Q. What is your professional training?—A. I received my training in the Camborne School of Mines. I am an Associate of the Institution of Mining Metallurgy.

Q. And you have the Camborne diploma?—A. Yes, of the first class.

Q. Where were you gold-mining?—A. In Southern Rhodesia.

Q. Are you now controlling, as Chief Mining Engineer, the mines belonging to Chrestien & Co.?—A. Yes.

Q. You have had three years experience of this?—A. Yes.

Q. You suggest that the Mining Rules should be drafted on lines more applicable to mica mining. By "mining rules" do you mean the rules for the granting of licenses and leases, or are you referring to something else?—A. The actual rules which govern the working of the mines under the Mines Act.

Q. You want some kind of rules by which the mines inspectors could insist, not only on working the mines with due regard to their safety, but also with reference to the proper exploitation of their natural resources?—A. Yes.

Q. Do you think that rules of that kind would be practicable and could be worked?—
A. Yes.

Q. Are there many occasions on which an inspector would find it very difficult to say to a mine owner, "You are not working this mine in a way that will conserve the natural resources of the ground"? It would be easy for him to say that, but would it be easy for him to say that with due regard to the miner's object to get sufficient profit?—A. That is another matter.

Q. That is the whole matter, because the miner works for the purpose of making profit?—A. Quite so, but such inspectors as I suggest could put a stop to much of the unnecessary waste going on. Under the present regulations they do make recommendations which are generally ignored, they have no powers to enforce them.

Q. But won't a general improvement come about as you get a better class of manager?—A. For our own sakes we are quite contented to go on as we are. It is a recommendation from the Imperial point of view for preserving the asset which does exist in the mica views.

Q. The principle so far observed is that Government do not interfere with the methods a man adopts in mining with regard to the mineral resources, because it is so very difficult to define what is practicable in regard to the miner's chief aim. Everybody however recognises the fact that if you have a good mine manager, he will work on most economical lines. I understand that at present there are a large number of small concerns in the mica mining district, and these concerns are so small that they cannot afford to employ fully qualified mine managers, and that probably is the root of the whole trouble?—A. Yes, I think it is largely so.

Q. Is there any way by which the smaller concerns can be forced into amalgamation with the larger concerns, and forced equitably?—A. I think such a state of things will come about in time of its own accord, that these small concerns will have spoiled their mines in a very short time. They will have to give them up and only the larger concerns can tackle them.

Q. That will work out automatically after mining reaches a certain depth?—A. It is not a very economical way of working it.

Q. If you kill off the small man you kill off the small prospector. Mica occurs in a large number of small occurrences, and you will have a large number of men thrown out of employment?—A. I do not agree that killing off the small miner means killing off the prospector. No men would be thrown out of employment. We allow prospectors to go and work our squares under slight supervision to a certain depth. There it gets beyond his abilities and we take it over ourselves.

Q. You say that the Mining and Prospecting Rules "should be drafted in consultation with experienced miners, having knowledge of local conditions. The rules should be made applicable to all mines and not only to such as are held under Government leases"?—A. I do not refer to the granting of leases; that was a reference to the Mines Act.

Q. Then you have no grumble against the rules for the granting of Mining and Prospecting Licences?—A. Personally we have none.

Q. What criticisms have you to make with regard to the present rules being worked under the Mines Act of 1901?—A. As a matter of fact they do not affect us very greatly at present, because they are not very strictly enforced. There are a great many rules allowed to be a dead-letter, but if they were enforced, they would in some cases bear hard on the miner and do not apply to mica mining as they do to other forms of mining.

Q. Are you in favour of the Government insisting on the keeping of accurate plans, and that this rule should be enforced?—A. Mines of any considerable size should keep plans. The main thing is to have records kept, so that if it is necessary in future to re-open an old mine, one knows where one is.

Q. When you say that "the men chosen as inspectors seem to be entirely colliery-trained engineers who necessarily lack the capacity to appreciate the requirements of reef mining and the man appointed as Inspector of Mica Mines should be a qualified mining engineer", do you think that the industry is sufficiently important to justify Government keeping special inspector for the mica mining area of Bihar?—A. I certainly think the industry requires nursing in that direction. The man should be an adviser as well as an inspector.

Q. In regard to mica thieving, the suggestions that have been made so far are of a kind that you know of, being borrowed from South Africa and relating to the thefts of gold and diamonds; but aren't the conditions so different that there might be considerable hardship in departing from recognised British law by throwing the burden of proof on to the man who has been accused?—A. I certainly think there would not be any hardship if you had traders trading under a license. If all the mica that is purchased is purchased under a challan, there should be no difficulty. We are perfectly willing to come under such a rule.

Q. That is all very fine in the case of large miners, but the larger number of small miners are difficult to deal with. Take the case of a man who has a mica mine out in the forest, and the mica is sent a distance of 3 to 6 miles to a godown. What is to prevent a cooly dropping a sheet of mica on the way and picking it up the next day?—A. Nothing whatever. That is what we want to stop. Do away with the receiver, since we cannot get the thief.

Q. Is it practicable to establish in the district two or three receiving depôts which would be in effect Customs Houses, making it illegal for any mica to leave the district except through those channels?—A. I think it would be very effective.

Q. Are you a member of the Kodarma Association?—A. I am not, but the firm, whom I represent, is.

Q. This question has been referred by us to the Mica Mining Association at Kodarma, with the view of their discussing it and putting up some scheme that would work. Will you consider the matter and discuss it with your Association? That is one suggestion put before us as a means of avoiding legislation, which, obviously, would be a difficult thing to introduce. You recognise the difficulty of reversing our ordinary canons of law, except for a very violent disease. Are there any other ways in which it could be done; would it be possible to limit the number of men who are allowed to carry mica under any circumstances by granting a pass to a certain cooly or a certain person to carry mica?—A. That point has already been discussed by the Association, and they thought it would be a cumbrous machine.

Q. Do you think it would be practicable to stop all carriage of mica at night?—A. I don't think so. The distances are rather great from the mines to the central factories and godowns, and the coolies don't arrive at the mines until 10 or 11 o'clock in the day, owing to the fact that they come from various parts of the jungle, so that they don't generally leave work until dark, when they carry the mica home.

Q. No system of organisation could be adopted by which mica could be stored locally, so that transport would only take place in daylight?—A. Yes, I think it would be feasible, if one had very strong rooms put up in each mine.

Q. Do you think that if the transport of mica at night can be stopped absolutely, or if it could be controlled in any way, that would reduce effectively the amount of mica stolen?—A. I would qualify the word "effectively"; it would reduce it no doubt. Not only in transport is the mica stolen, but right at the working face, from the mouth of the mine, and even from your very godown. It is not so much the thief we are aiming at, but the receiver.

Q. So that some system of control depôts would be the most suitable?—A. I think that is probably the best suggestion.

Q. Do you know the Nellore district?—A. Yes.

Q. Are you responsible for any operations there?—A. Yes, we have two or three mines.

Q. There is less mica thieving there?—A. There is certainly less thieving; there are practically no traders there.

Q. Because the concerns are larger?—A. Yes, they are more centralised.

Q. Have you not suggested the introduction of villages in the forest reserve at Kodarma?—A. We have been discussing it ourselves, as to whether we could make settlements near the mines.

Q. The price of timber for mining purposes would go up?—A. We get very little from the Kodarma forests; our own mining timber is drawn from outside.

Q. You think that the reserve is of less value to Government as a forest than from the point of view of mining mica?—A. It certainly interferes with it a lot.

Mr. C. E. Low.—Q. Is the continued existence of the forest there necessary to the industry?—A. No.

Q. I mean for other reasons than the provision of mining timber?—A. No, we shall be glad to get the timber if the forest is cut down, as it is very difficult to get any timber from the forest and we have to send right down to Kodarma.

Q. Therefore it would not seriously injure the industry if the forest disappeared?—A. No, it would do us a great deal of good.

Q. Do you know if it is necessary at all to any of the surrounding villages?—A. They get a certain amount of grazing out of it, and are allowed to cut bamboos out of it. You won't find villages situated close to any mines.

Q. Turning to the question of transport, you complain of the condition of the forest roads?—Yes.

Q. Is your transport a light railway proposition or a road proposition?—A. A road proposition.

Q. How far are you from the nearest railway?—A. Kodarma town is 7 miles, i.e., the edge of the jungle stretches from there. Kodarma forest is only a small proportion of the mica area.

Q. But the quantity of stuff you move to and from any particular area is not large enough to warrant a light railway in that country?—A. The stuff we move from the mines would not be, but we are getting in material constantly. We are at present importing a good deal of coal and one thing or another.

Q. You quite recognise that it is not the function of the Forest Department to make roads for anything except for the extraction of their own produce, nor are the Forest Department particularly skilled road-making engineers. You would presumably prefer the road to be made by the ordinary organisation for doing so?—A. Yes, either the Public Works Department or the Local Board.

Q. Would the industry be prepared to make any special contribution to such a road?—A. I think so. I think we should be prepared; in fact we have done a good deal to roads ourselves at times.

Hon'ble Pandit M. M. Malaviya.—Q. Your say that "the man appointed as inspector of mica mines should be a qualified mining engineer, with sufficient experience in *vein* mining to allow of his giving advice useful to a mica miner." At present, so far as you are aware, none of the inspectors so appointed has had any special training in mines?—A. They are all mining engineers but *colliery* mining engineers, which is an entirely separate branch.

Q. You want qualified mining engineers who can deal with mica?—A. A mining engineer is generally understood to apply to metalliferous mining. Mica mining is *vein* mining, i.e., similar to metal mining.

Q. Among the men who are employed in your mines, are there many who have received any technical instruction?—A. No, none.

Q. You received your education in some School of Mining?—A. Yes, the Camborne.

Q. There is no school in this country as far as you know?—A. I think not.

Q. Do you think that the establishment of such a school would supply you with men qualified to take up the work of inspecting areas?—A. I don't think the establishment of a School of Mines would be quite feasible. I think they teach a certain amount of mining engineering in Silpur, and some form of instruction on the coal fields, but I don't think that the people of the country are quite ready for a School of Mines. You want to start with something elementary.

Q. Supposing you had a student who had received his education in a School of Mining, do you think that there would be employment found for him in the mines?—A. Undoubtedly; we are most anxious to get men with some slight technical knowledge even.

Q. You say that you would like the mica mining area treated as a magisterial centre?—A. Yes, we now have to take our cases to Hazaribagh town which is 50 miles from Kodarma.

Q. You want the sub-divisional officer to remove his headquarters there?—A. Yes, or another similar official stationed at Kodarma.

Q. Do you think there would be a sufficient number of cases to justify the establishment of such headquarters; are there a sufficient number of cases?—A. I cannot tell you.

Q. Are there many cases which have to be sent from Kodarma?—A. I cannot say whether the number is large but it would certainly be a good deal larger if cases were dealt with at Kodarma as prosecutions are now extremely troublesome.

Q. Since when have you noticed this difficulty of labour not being obtained?—A. In my time there has always been a shortage of labour, but in the last year or two I think the numbers have diminished. There are not so many mines actually working now as there were a couple of years ago, but we have rather more difficulty in obtaining labour now than we had then.

Q. What reasons have you to think that emigration has been responsible for it; are many people taken from the area around you for emigration?—A. Yes, I think it is a place to which recruiting people come very largely. I know that 500 or so were taken to Tavoy about twelve months ago.

Q. Are they also taken to other parts of the world?—A. They disappear; I cannot say where they go to. There is a good deal of snatching going on from one concern to another.

Q. Is this recruiting for emigration going on all the year round?—A. No, I don't think so, not very much at present.

Hon'ble Sir F. H. Stewart.—Q. Would you give executive powers as well to the inspector of mines?—A. I should give him both.

Q. So that if he found a mine being worked on very bad principles he could say to the mine owner, "You must remedy this at once or I shall stop your works"?—A. Yes.

Q. Would not that lead to a great deal of friction?—A. You require a man who has a good deal of discretion. I don't think it is unworkable.

Q. He would have to be a free agent and should be the ultimate authority, and there should be no appeal beyond him?—A. I do not think there would often be any question of appeal, at present what Government are doing in effect is to say to the square holders "you must work a certain proportion of your squares, we don't care how you go about it, you can ruin the deposits as long as you don't kill any one." My experience in Rhodesia was that there officials had separate districts. They had inspectors with considerable powers and also an engineer in an advisory capacity to pay periodical visits to anyone wanting him on payment of a nominal fee, a very useful man indeed.

WITNESS NO. 93.

MR. E. S. TARTON, A.M.I.M.E., Chief Engineer, Kumardhubi Engineering Works, Limited, Mr. E. S. Tarton, and Collieries controlled by Messrs. Bird & Co.

WRITTEN EVIDENCE.

*Q. 45.—To improve the labourer's efficiency and skill, first of all give attention to his training of labour, surroundings by seeing that healthy and suitable housing accommodation is provided; (2) by

explaining how epidemics are caused; (8) by inducing men to spend more on suitable clothes and less on intoxicating drink. The labourers must be trained to become ambitious and the education that is offered must tend to cover these points. Certain proportions of the higher educated classes should be persuaded to leave law and medicine for a more practical life.

I have noticed in the engineering works with which I am connected, that very seldom do you obtain any sense from either the young or old before they have spent at least 18 months or two years in the shops. This is accounted for by the individuals not having received any elementary education. We have an elementary school for the work people, but it is very badly attended. My opinion is that the remedy lies in some form of compulsory education suitable for the industry of the particular district.

I find the higher the rate of pay the less attendances the workmen make, and until we are in a position to educate the workmen to a higher standard of living, an increase of wages will not improve the standard of Indian manufacturers or will India be able to produce an article equal to that manufactured in the West.

Training of supervision.

Q. 51.—For Europeans born in this country, education should be made compulsory from the age of 7. If the children are of poor parentage, the cost of their education should be borne by Government up to the age of 15. After this age the boy should be consulted and with the aid of his master his future career arranged for. If it is decided he enters the engineering profession he should serve five years' strict apprenticeship as the boys do at home. The firm by whom he is engaged should allow him time to take full advantage of any technical school there is in the district.

This particular district is not provided with a technical school, but I do think it is sufficiently developed to have its own college for the technical training of the engineering and mining student.

There are evening classes for mining students held in the district. As far as I am aware, they are not well attended but should be continued until such time better facilities are arranged.

The mechanical side of this particular branch of engineering is almost entirely neglected, and with the advent of the latest type of machinery something should be immediately done to provide the necessary technical training.

To help forward these classes special demonstration should be opened in local workshops until such time as technical schools are opened where instructions by British instructors could be given.

Study of foreign methods.

Q. 77.—I think Government should assist engineers of this country to study the latest practices in engineering in the West. At the present time a man on six months' leave has only time to take a glancing view of what is going on in the well equipped factories and shops in Europe, whereas, if Government drew up schedules of what could be seen and studied, an engineer may apply for three months' study leave every three or four years to study some particular branch of engineering which would apply to his particular department in India.

Railways.

Qs. 97 & 99.—There are many collieries in the Jherria and Raniganj coal fields, where properties are badly cut up by sidings. The coal underlying these sidings must be maintained for the purpose of supporting the approach and approaches to wharfs that are loading, perhaps on an average, 100 tons of coal per day. Not only does this coal lie untouched, but it often interferes with the lay-out of the underground workings, and other coal is lost and the cost of production in the particular area increased by haulages not laid out to the best advantage.

This wastage can be overcome by loading at a central point, i.e., coal from each pit may be delivered to a central loading point by aerial ropeway.

This system of transport not only grants the collieries full use of their properties for extraction of coal, but it provides part of a scheme for using the minimum of railway rolling stocks and liberates a large percentage of the surface labour for the production of coal.

I will try and explain how the railway can be assisted and how labour is liberated for production purposes.

For demonstration purpose I am taking one of a number of collieries raising 600 tons of steam coal per 24 hours—the quantity is raised from four pits :—

(1) The coal would be carried from the pits by an aerial ropeway to a large bunker, 1,200 tons capacity (I have taken this size bunker because the carrying capacity is sufficient for a rake of waggons). To expedite loading the bunker is fitted with suitable (shutes) for loading any type of waggon. The time taken for loading would be from 15 to 20 minutes.

To handle 600 tons of coal under present methods it is necessary to split up 30 waggons, or the quantity required for 600 tons, into four sidings, which alone takes more time than 60 waggons would to load if loaded from a bunker.

(2) It takes four persons a day to load one waggon or 120 to deal with 30 waggons. By aerial ropeway, 5 men would be in attendance at the loading end, 3 men at each pit for loading the ropeway buckets, making a total of 17 men. To this I will allow a further margin of 10 men.

The summary of this suggestion is—

(a) No coal is locked up for supporting sidings to pits.

(b) Time taken for loading 30 waggons or 600 tons is reduced from 20 to 2½—3 hours.

(c) The waggons are centralised, which allows the pilot to immediately make up his train.

(d) 77·5 per cent. of the surface loading labour is released for coal cutting in the mines.

At the oral examination, if I have the honour to be called, I shall be pleased to produce plans in order to make clear any doubtful point.

ORAL EVIDENCE, 30TH NOVEMBER, 1916.

President.—*Q.* Will you please give us an idea of the length and kind of experience which you have had in coalfields?—*A.* I have had ten years experience in the Indian coalfields. My experience is limited to Ranigunj and Jherria coalfields.

Q. And you have had an opportunity of taking a special interest in engineering questions?—*A.* Yes, I am the Chief Engineer for the collieries controlled by Messrs. Bird & Co. and Kumardhudi Engineering Works. We employ approximately two thousand men in the workshop and our output of coal is $\frac{1}{15}$ th of the total output of the Indian coalfields.

Q. Are the Engineering Works engaged chiefly on repairs?—*A.* We are constructional engineers, also engine builders. At present we are engaged on building electrical winders and haulages. The electrical parts come from home and the mechanical parts are made in our workshop. We buy steel from Messrs. Tatas.

Q. Have you been depending on Tata's steel for a long time?—*A.* No, for the past two years only. We are now entirely dependent upon Tatas for R. S. Joists. Large bars still come out from home, also steel cut gears, there are no such gears made in this country.

Q. There are some parts that you cannot make even if you are provided with steel and iron?—*A.* Not as regards steam engines. We cannot make internal combustion engines.

Q. Are you also interested in the Pottery Works associated with the Engineering Works?—*A.* I am Chief Engineer for the Pottery Works. I have no experience in silica and refractory other material. We manufacture silica, chromite, magnesite and fireclay bricks. As far as I am aware the material gives satisfaction.

Q. Is there a fairly big outturn of those classes of bricks?—*A.* The output is not great, but we are doubling the plant. Machinery for increasing the manufacture of silica bricks is on its way out from home.

Q. Have you in contemplation some system in which you would train young apprentices in connection with your work?—*A.* Yes.

Q. Is that scheme put into operation?—*A.* Are you now referring to the coolie labour?

Q. The training of young apprentices?—*A.* At the Engineering Works we are building a home for 16 boys. Eight of these will receive a mechanical engineer's training, the balance of students will be trained at the collieries as mining engineers and sent to the Engineering Works to gain experience in mechanical gears applied to mining.

Q. What is the length of the course?—*A.* Five years.

Q. Four years at the mines and one year at the Engineering Works?—*A.* Those who intend to become mechanical engineers will spend the whole of the time at the Engineering Works.

Q. Where do they get theoretical training?—*A.* Lectures will be given at the Engineering Works and at the collieries. At present there are evening classes for mining students held in the Jherria and Ranigunj coalfields.

Q. There are four or five centres for evening classes for mining?—*A.* Yes, Jherria, Dishergarh and Sijua. I am not quite sure about Ranigunj.

Q. You know of these evening classes?—*A.* Yes.

Q. And you think they have been satisfactory in the past?—*A.* I do not think they are well attended.

Q. They were attended at the beginning fairly well?—*A.* The students always fall away towards the end of the course.

Q. We shall presumably get the figures with regard to the attendance during the last ten years. Do you think they have done good work on the coalfields?—*A.* Yes, and I think they should be extended.

Q. Would you prefer the young men trained in that way, or would you prefer to send them to Sibpur or some such college?—*A.* I very much favour a college in the coalfield.

Q. Would you send the men for full day training?—*A.* My idea is boys should be taken on as apprentices and allowed time for technical study.

Q. What time, a week or month?—*A.* I suggest that half a day be spent at the mine for six days of the week and four half days at the technical college.

Q. How do you get over the difficulty of distance?—*A.* If a college is built either in Dhanbaid or Asansol it will be convenient for them to get there by train.

Q. How long will you take, for instance, to go from Ranigunj to Dhanbaid?—*A.* A train leaving Ranigunj at 12-30 would arrive at Dhanbaid about 2-30. A train leaving again in the evening at about 7 would be back again at about 9 o'clock.

Q. That is going to be pretty heavy tax on the students?—A. I do not think there are many students living at Ranigunj.

Q. When your mines extend into Goalpura, how will the students arrange?—A. They will have to come in for two or three days at a time.

Q. Why do you not begin with the system that you know will last longer and arrange for these men to go to the mines either for a certain number of days in the week or a certain number of weeks in the month, or a certain number of months in the year?—A. I do not see any reason against it, but I should have thought had the students been sufficiently energetic they would find ways and means of attending.

Q. No matter how energetic a man is, he is not going to sacrifice four hours a day in the train and call that time well spent?—A. After all, Dhanbaid is only a few miles from the Jherria coalfield. This is where most of the students come from.

Q. What is your opinion on the question there should be a certain number of half days?—A. A certain number of days would possibly make it much more convenient for the students.

Q. It is not merely a question of convenience. Do you think that the educational effect would be just as good as if the man spent one or two days or a week in the college and the rest of the time in the mine?—A. I think quite as good.

Q. Have you any objection on the score of principle to extending the principle further and allowing the men to spend six months at the school and six months at the colliery?—A. I see no reason why they should not, but I think it will be better for the student to receive practical and technical training together by attending college for half the week and the remainder at the mine.

Q. When do you hope to get the whole scheme into operation?—A. In a few months.

Q. You are going to provide them with a home to live?—A. Yes.

Q. And there should be some one to look after the home?—A. We have already started one home in the coalfield and there are four boys attending with a matron in charge.

Q. What class of boys?—A. Boys recommended from schools in Calcutta, Europeans, Eurasians or Indians. Boys will be taken on the recommendation of the Head master.

Q. Does caste prejudice interfere in any way?—A. We shall try and arrange for boys of one denomination to be put together.

Q. You have had a good deal of experience in constructing ropeways?—A. A fair experience.

Q. To what extent could you construct ropeways? Can you give us an idea of mileage?—A. Ropeways are built in section, single rope system 4 to 5 miles between stations. Double system $1\frac{1}{2}$ to 2 miles for rail cable tension and 4 to 5 miles hauling rope.

Q. Are there large spans?—A. We have a span of 1,500 feet. There are single cable spans of 4,500 feet. Double cable 7,200 feet.

Q. How is the cost of a span compared with constructing a siding in the coalfield?—A. In the case of Saltore, we bored the river and found sand to a depth of 132 feet. No company would undertake to bridge a river of 1,500 feet span and lay a railway track for 70–80,000 tons of coal per annum. By erecting this ropeway we overcome natural barriers which would have made any other method of transport impossible from a commercial point of view. Another instance is where we erected a ropeway, $2\frac{1}{2}$ miles in length, at a cost of Rs. 10,000 more than the estimate for siding. In doing this we did not lock up any coal and saved three annas per ton on coal passed over this $2\frac{1}{2}$ miles section after allowing one anna per ton for aerial transport.

Q. What difficulties are there about carrying out your ropeways? What about local rights and surface rights? Are you interfered in any way?—A. In the case last referred to, we had trouble with the people who held the surface rights, they asked ridiculous rates for the small plots we wished to take up for trestle foundations. We were able to remove the alignment to another property.

Q. The mobility of the rope gives you some advantage?—A. Yes, and the ground required for the erection of a ropeway is very small.

Q. What about crossing a public thoroughfare?—A. We have to bridge underneath the rope.

Q. Any difficulty about getting their sanction?—A. We are compelled to put up a protection bridge.

Q. In the first instance are you allowed to put in a wire ropeway without the sanction of the District Board?—A. We have had no trouble so far.

Q. In that way you get coal on to the railway at a convenient point?—A. The practice we have adopted for removing coal from the mine to the railway is by arranging the brickwork of the heapstead to form part of the bunker from which the ropeway buckets are fed. By this method waggons are mechanically loaded.

Q. So far, this work is entirely your own private arrangement?—A. Yes, but we are constructing three ropeways for other concerns.

Q. And is it your idea that this system should become general and some system of co-operation or systematic arrangement should be made by which everybody can take part?—

A. It is worth consideration. At one of our collieries we have 2½ million tons of coal locked up under railway sidings. In this particular case the railway passes over the property with five spurs to feed other collieries, the loss, due to these sidings, is very considerable.

Q. Is there any opportunity of economic sand filling?—*A.* I think that will and must come.

Mr. C. E. Low.—Q. What is the difference between the carrying power of a ropeway and of a siding?—*A.* An aerial ropeway should be designed to deal with the maximum quantity of material to be transported through a limited time and the capacity can be anything up to 300 tons per hour. The capacity of a siding if a single line depends on its length and the grades and the type of locomotive used, but in practice it is usually the loading arrangements which do not permit sidings being used to their maximum carrying capacity.

Q. I am not talking about the general economy of the use of waggons. Take your Saltore ropeway.—*A.* Saltore line is designed to carry 350 tons in 10 hours, this quantity removes the output of this particular mine, but this amount can be doubled by working the ropeway 20 hours if necessary. In some cases ropeways are designed to carry 300 tons of coal per hour.

Q. The design of your ropeway installation admits of great flexibility?—*A.* Yes. We design a ropeway to carry a certain tonnage.

Q. Owing to the number of sidings there has been a great difficulty in the matter of the locking up of coal?—*A.* Yes. Ropeways would minimise this.

Q. Does the carriage of coal by ropeways entail any greater damage to coal than the handling by sidings?—*A.* No. I consider very much less.

Q. Do you contemplate any definite arrangement about the co-operative working of ropeways by collieries?—*A.* No, not for loading coal. Yes, in the case of conveying sand from the Damuda river for sand packing for a group of collieries in the Sijua division.

President.—Q. How are you going to turn this into practical working on a large scale? Do you want us to make proposals, or are you prepared to co-operate yourselves?—*A.* I will make a proposal showing how railways and coal companies can be assisted. For instance, in the case of rolling stock, the saving of permanent track, a reduction in surface labour, and, last but not least, extracting coal which at the present time is locked up in the shape of million of tons supporting the necessary colliery sidings. If by collieries having one central loading depôt, instead of five or six which is the usual case, coal can be taken by ropeway and loaded direct into waggons according to the quantities raised at that particular colliery, it matters not whether the colliery is raising a few hundred or a few thousand tons per day, the quantities can be dealt with at the depôt in a few hours. This concentration of loading cancels the hours spent by the pilot engine running about the colliery yard placing a few waggons in this and that siding; it permits of the engine coming in with an empty rake and drawing out the loaded one in the space of a very short time. In my written evidence I gave the time taken for loading waggons and the time saved. It is therefore necessary for the railway and coal company to co-operate.

Q. How are you going to co-operate? Do you want any legislation or pressure?—*A.* I think if the railway companies insist on loading at a central point and graded their siding to deal with the increased traffic, colliery people would look round for the best method of placing the coal at this particular point. Several of our collieries have adopted this system and found it most successful. At the present time we are constructing three lines for other companies, allowing for loading at one depôt.

Mr. C. E. Low.—Q. Supposing there is a Board of Arbitration to decide as to what is to be done in case of coal locked up at the sidings, do you think that such a Board could exercise any useful or fair pressure in the direction of inducing people to put up ropeways?—*A.* Such a Board should be given powers to liberate the coal either by sand stowing or ropeways.

President.—Q. Your idea is that the pressure should come from the railway company?—*A.* Yes.

Q. Your firm is interested in this financially?—*A.* We put in the Saltore ropeway and found it a great success, therefore at points where we found loading difficulties and large quantities of coal likely to be locked up by sidings we installed ropeways, several other people have realised this fact.

Q. More than that, you are the actual constructing company?—*A.* There are other companies building ropeways. It is open competition.

Q. You have nothing in the way of monopoly?—*A.* No. All steel castings come from home which places home manufacturers on equal terms.

Q. Is there anything connected with ropeways that cannot be made in this country?—*A.* Steel castings.

Q. What about the rope itself?—*A.* Yes.

Q. Do you know enough of rope manufacture to give us an idea whether steel ropes can be made in this country?—*A.* No.

Q. You are pushing this idea now without any intention of securing any monopoly of the business?—*A.* We have no intention of trying to create a monopoly. Ropeways can easily be built. We could not, in any case, create any monopoly.

Q. And then two or three systems might co-operate quite easily?—A. Yes. Some people build in the mono-cable system and some in the bi-cable. Both can be easily applied.

Hon'ble Pandit M. M. Malaviya.—Q. The Pottery Works are in the same property?—A. Yes.

Q. What is the number of persons you employ at the Engineering Works?—A. Two thousand.

Q. In the Pottery Works?—A. Four to five hundred. The Pottery Works have been in existence for nearly six years and the Engineering Works for about six years.

Q. You have felt the need of having trained engineers in your Works?—A. Yes.

Q. You propose to start your apprentice class, mainly because there is no such technical college as you propose should be established?—A. Yes.

Q. But suppose a school of mines is established at Dhanbaid would you even then start your classes?—A. I should certainly go on because I do not think the mining college would be sufficiently advanced for several years to be able to sufficiently train mechanical and electrical engineers.

Q. What is the financial aspect of this proposal? Will you charge a fee?—A. No.

Q. Do you think that the men working in your Works will be able to spare the time necessary for imparting technical instructions?—A. The idea is that our staff will lecture in the evenings.

Q. It will be additional work, a work of love?—A. Additional work.

Q. In your experience of these several thousands of men that you employ, you have found the elementary education a great lack or hindrance to efficiency?—A. Yes. You bring a boy into the workshop and put him to work with a fitter or lathe man. It is more or less two years before he can read any measurements. He cannot write his name or take any written instructions in the vernacular.

Q. You have found that the absence of ambition in these labourers is also a great hindrance to their progress?—A. Yes.

Q. The remedy you propose is general compulsory education?—A. Education for the industry of the particular district.

Q. I understand you to say that you want elementary education first and then education suitable to the industry of the particular district added on to it?—A. My object is to first give them an elementary grounding, as they rise to a higher standard, bring in the work that one hopes will be useful hereafter.

Q. That is you will start them with general primary education and then add special subjects in which they may be trained?—A. Yes.

Q. You propose that for Europeans born in this country there should be compulsory education from the age of 7 to 15 and you would be in favour of similar education for Indians?—A. Yes. I think the lack of education is a great hindrance to industrial efficiency.

Q. You say "with the advent of the latest type of machinery something should be immediately done to provide the necessary technical training," and you apprehend that in the future after the war, the competition in trade and commerce will be keener, and more and more improved machinery will be employed?—A. What I feel at the moment is this. We are now accepting home theories. Plant brought out to this country from home is the very latest, the men available are not sufficiently highly trained to handle it to any degree of safety.

Q. And this plant is likely to be of a more and more improved type in the future?—A. Yes.

Q. And in order that you should have sufficient labour to handle this machinery, you want that technical schools and technical colleges should be established?—A. Yes.

Q. To afford the necessary practical training?—A. Yes.

Q. You think the absence of such technical instructions will be as great a hindrance as the absence of capital in promoting industry?—A. Yes.

Hon'ble Sir F. H. Stewart.—Q. You think your proposal about establishing ropeways instead of sidings in certain existing and otherwise equipped collieries would pay?—A. Yes.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Who are the large purchasers of the silica bricks that you produce?—A. Tatas.

Q. Do you think you will be able to supply them with all their requirements?—A. I think so in a few years.

Hon'ble Sir R. N. Mookerjee.—Q. Have you a complete scheme for this ropeway as to what will be the cost and what income it will bring?—A. It is necessary to consider each scheme upon its merits. The quantity of material carried, the class of country the ropeway passes through are the chief governing factors.

Q. Then you propose to charge different rates to different collieries?—A. Certainly. It does not follow that the cost of putting a ropeway to carry 100 tons for one colliery will run out at the same rate as another line carrying the same quantity over a different contour.

Q. Is there anybody who can put that capital to do so?—A. No.

Q. If you charge different rates for the ropeway, will the people come to the ropeways leaving the sidings?—*A.* Your idea is that one company should run the whole of the ropeways in that particular coalfield?

Q. Because each individual company may not have capital to make its own ropeway as they have got sidings?—*A.* I do not think one company would undertake to deal with the whole output of Jherria and the Ranigunj coalfields. If a colliery is of reasonable size and can afford to sink pits it should be in a position to put up capital for the transport of coal.

Q. Most of the collieries are working with limited capital, you must not depend on the present temporary boom?—*A.* I do not think you can look at it from that point of view.

Q. My point is, are you sanguine that if you bring out this scheme of ropeway people will come forward to it and join the ropeway and give up their sidings?—*A.* I certainly think people who have sidings in their colliery locking up large quantities of coal will take them out and put in ropeways to deliver coal into waggons, if the amount of coal locked up shows a profit if extracted.

President.—Q. You can get a map of the coalfields showing the present sidings?—*A.* Yes.

Q. Is it possible for you, within any reasonable period, to draw up a sort of scheme showing how ropeways may be put in to replace the whole or most of these sidings, marking out your points of assembling certain groups of collieries? If you draw up a scheme of that kind, a certain number of these propositions will mature in the next five or ten years and gradually the whole field will be assembled by means of a system of ropeways to a certain point. If you had the information in the form of a map together with estimate and cost, it would be seen by people and perhaps you would form a syndicate composed of the leading colliery people in the district and this syndicate would be willing to finance the construction of ropeways as fast as the people of the district wished to go into it. Is it possible for you to do so? Is that not the best way?—*A.* We have no intention at present of putting forward such a scheme. It certainly pays us to centralize loading, it is therefore pretty certain other people will look into the question. It is quite possible to draw up a map of the sidings and show ropeways where lines at present are laid. Where a colliery has one siding dealing with the coal, that would not be improved by the installation of a ropeway, the efficiency comes in where there are a number of spurs radiating from the siding splitting up the property.

Q. Supposing you produce all this information at your own expense and trouble and form a syndicate, would that syndicate want to establish a right of pre-emption?—*A.* I am putting it forward in the public interests.

Q. What I want to know is, can you suggest any practical way in which it can be made of general use?—*A.* I think it could be done. We are considering ways and means of bringing sand from the Damuda river to the collieries for sand packing. Only short local alignments are necessary to deal with the coal question.

Q. The syndicate would want public rights?—*A.* Yes.

Q. And therefore exclusive rights?—*A.* I won't say exclusive rights.

Hon'ble Sir R. N. Mookerjee.—Q. You are very successful in your own colliery ropeway. But was not your colliery specially situated inasmuch as you have no other way to win your coal?—*A.* Are you referring to Saltore? A railway is impossible.

Q. Whether profitable or not you cannot win your coal without the ropeway?—*A.* This ropeway is erected on difficult ground and it is a costly line from the manufacturer's point of view. Even in this case we place the coal into waggons at less than one anna per ton per mile.

Q. Following the President's question, if you form a syndicate, you will know that there are coalfields where the siding is a straight line and they will not possibly join you?—*A.* I do not think they would.

Q. You cannot include every coalfield in a certain area.—*A.* May I show the plan of a ropeway?

Q. If you have to put in a ropeway in a certain area, and you cannot get every colliery to join your ropeway you lose the trade from that portion?—*A.* I am afraid you have not quite gathered what I mean. We cannot put in one line to deal with the whole of the coal. Collieries must run their own section bringing the coal to one central position instead of loading at a number of wharfs in their property.

Q. Have you got sufficient experience to tell us that a ropeway would be as efficient and as substantial as a siding?—*A.* Each colliery ropeway and siding must be considered on its own merits.

Q. There is more chance of obstruction in ropeway than in siding?—*A.* There is very little than can go wrong with a ropeway.

Q. It is no doubt a good idea to run a school where lecturing will be honorary work. But is it a feasible scheme?—*A.* What I intend to do is to train our own men. It is not intended for the public. The staff of the respective departments will lecture to the boys on the subjects they have been specially trained in. I wish you to understand that this is for our own, but I consider it necessary for apprentices throughout the whole field to be trained accordingly. I hope to see a college in Dhanbaid or Asansol.

Q. Up to what horse power engine can you construct in your shop with materials supplied locally?—*A.* We can construct engines up to 75 horse power.

Q. You have nothing to depend on imported materials?—A. No.

Dr. E. Hopkinson.—Q. You say that all steel castings have to be imported?—A. Perhaps I am not correct in saying all, very few steel castings are made in this country, such as those required for cut gears and ropeway work.

Q. Do you employ coal cutters?—A. We have employed them, we did not find them altogether a success. The machines were all right but the labourers wanted the same money for loading coal as they did previously for cutting and loading.

Q. Are you aware of any ropeways in operation in India?—A. Besides our own, the Bengal Iron and Steel Co. have a ropeway carrying iron ore, there are two at work in Burma, one is about 9 miles long.

Q. How many independent collieries might be involved in any particular general scheme of ropeways?—A. It is difficult to say, possibly 20.

Q. And you consider it impossible to get a combination of these 20 companies?—A. I do not say that. We erected our first ropeway about five years ago. Since then we have put in three for ourselves, another one is in course of erection in Burma, one for carrying passengers and merchandise in the hills is under consideration, the length of this is about 7 miles. Three others are in the course of construction.

Q. In the last paragraph of your evidence you say Government should assist engineers of this country to study the latest practices in engineering in the West. What have you in mind?—A. What I have in mind is this; an engineer working in this country for three or four years is out of touch with the latest tools and designs in use at home; when on leave a great deal of time is lost in getting into touch with the people who have the latest information, and they may not be willing to show what you want to see. If Government drew up a schedule of the latest practices adopted in the West and assisted men from this country to see these, the information would be of the greatest value to this country.

Q. Do you think that it is a matter for Government assistance?—A. I certainly think it is for the Government to assist the industry.

President.—Q. How is this to be practicable?—A. They could issue particulars of certain manufacturers pointing out how and where the information might be obtained especially on the continent and in the United States of America.

Q. Would not the appropriate technical associations do this for their own professions?—A. I don't think so.

Q. Dr. E. Hopkinson.—You suggest that Government should publish a schedule of what is to be seen in Europe and that they should then assist engineers in paying a visit?—A. We in India hope to be able to compete in any market, but there are no tool makers out here, for everything in this direction we must go West. We out here are entirely out of touch with what is going on at home, we cannot possibly keep up-to-date without applying for leave to study that particular branch of engineering at home.

Q. What you suggest is that the Government should prepare catalogues of these things?—A. I would not go so far as that, but Government might make it one of their duties to keep in touch with large up-to-date factories and assist engineers on leave to take full advantage of any new work during the short period they are in Europe, especially in the design and manufacture of tools.

Q. But the maker of the tool is generally a different person from the user?—A. This is so.

President.—Q. What we do in practice is this. You take the technical journals regularly and when you come across points that are of interest to you in your work you make a note of them and draw up your own little programme. When you go home, you may spend three or six months, and if on the top of that you think that you want an extra six months it is your affair. I do not see how the Government can draw up any kind of schedule. It is impracticable?—A. I do not think it is so. India should be able to compete with the West with manufactures.

Q. That is a fine idea, but is it possible for the Government to draw up a schedule of tools, which you should go and see?—A. You find that there are a great number of special tools.

Q. But you have got your own technical journals?—A. Journals are often published in the shape of advertisements. We require the actual practical efficiency. I do not want to throw out a good idea, but I cannot feel now that it is practicable for the Government to do that.

Dr. E. Hopkinson.—Q. What does your technical staff consist of?—A. In our colliery we have a technical man as manager, then two or three assistants who are mostly Europeans and Eurasians, and then the Indian technical staff with the Bengali as surveyor. Most of the surveyors are Indians. The winding engineers are all natives.

Q. Practically the mining engineers and the two assistants are Englishmen and the rest are Indians?—A. Yes.

Q. You suggest that there should be compulsory education suitable for the industries of the particular district. What have you in mind?—A. I should like to educate the youth of the country to be in a position when he leaves school for the workshop or mine to take an intelligent interest in the work that lies ahead of him.

Q. You mean compulsory primary education?—A. The native in many cases is under-fed, this is very often due to lack of education. You often find if a native has four annas in his pocket he won't go to work until it is spent. We have given men clothing and other assistance, they sell the goods and remain away from work until they have spent the last pie. This is detrimental to health and only education can adjust such matters.

Q. What do you mean by saying education suitable for the industry?—A. I now refer to the workshop. We find a great number of men and boys are absolutely useless for the first two years of their training because they cannot read or write.

Q. You have in mind some different form of education?—A. What I should like to do with the people in our compound is to teach them to read and write, afterwards as they improve the elementary principles on which their life's work will be based.

Q. To teach them to read and write and at the same time technical training?—A. Yes.

President.—Q. Would you have manual training in the primary schools or would you have primary schools for simple education and then separate industrial schools to teach the boys the rudiments of industry, because in primary schools you cannot get the right class of men to give training in manual work?—A. On the lines of an industrial school.

Mr. A. Chatterton.—Q. I gather from your note on education that it is necessary for proprietors of engineering works and collieries to make their own private arrangements for the education of their workmen. The existing facilities for education are not sufficient?—A. I do not consider education for the menial classes has received the support it should have had.

Q. In carrying out your idea would you confine it to primary education in a school and afterwards provide industrial education in the workshop?—A. I would prefer the industrial education.

Q. That will be before you put them in the workshop?—A. Most of the boys are useless when they first enter the workshop.

Q. The ideal that you are working up to in making education compulsory is that your workmen should have a certain amount of education before they come to your workshop?—A. Yes.

WITNESS No. 94.

MR. J. PRESTON, *Chemical Engineer of Messrs. Simon-Carves, Ltd., Manufacturers of bye-product ovens, tar distilling plants, etc., Manchester.* Mr. J. Preston.

WRITTEN EVIDENCE.

With the exception of the East Indian Railway at Giridih and the Bengal Iron & Steel Co. at Kulti, practically the whole of the Indian output of metallurgical coke has for many years been manufactured by the most wasteful methods possible. The open country oven which is in general use is even more wasteful than the old British beehive oven which is now considered to be obsolete.

A further advance has been made in the coking and bye-product recovery industry by two large new installations being put to work, one at Sakchi Works and the other at the Lodna Collieries.

With large iron producers, who have large expert staffs, it is a natural sequence for them to adopt scientific methods of coking, thereby reducing the cost of their final product to a minimum. This is not so with the collieries; their chief product is coal, in most cases any coke which is produced is looked upon as an insignificant subsidiary product which requires little consideration.

Many colliery owners and managers would appear to have an antipathy against scientific distillation and coking of their coal. I think the reason for this is that the true facts of destructive distillation and the recovery of bye-products have never been put before them except by such people as myself who are personally interested in pushing the industry.

The loss by coking of coal in the Jheriah field is a serious one which will increase year by year. I beg to put before you a conservative estimate of the loss occasioned by the use of the open ovens.

During 1915 there were about 225,000 tons of hard coke produced. For this quantity approximately 450,000 tons of coal were used. Had this quantity of coal been coked in a scientific manner 337,000 tons of coke would have been produced; there was a loss of 112,000 tons of coke. Taking the low estimate of recoverable products at 1 per cent. of ammonium sulphate, 2½ per cent. coal tar and 2 gallons per ton benzol, the total loss was as follows:—

112,000 tons of coke nett profit	Rs. 3-0 per ton	Rs. 3,36,000
4,500 tons ammonia	" " " 150-0	" " " 6,75,000
11,250 tons coal tar	" " " 50-0	" " " 5,62,500
900,000 gallons of benzol	" " " 0-8 per gallon	" " " 4,50,000

Total . Rs. 20,23,500

There were also during 1915 about 75,000 tons of soft coke made in the Jherriah field. On this also there would be similar losses. The total loss to the country is enormous, as you can quite realize from these figures. Although there are no figures available showing total productions of soft and hard coke in all fields, it is well known that some hard coke and the bulk of the soft coke is produced in other fields than Jherriah.

In my opinion the time is not ripe for any legislative steps to be taken in India to stop this waste, as by so doing great hardships would be inflicted on many colliery companies. I think the Government should start an active propaganda to point out the advantages to colliery owners of coking their coal in a rational manner.

The Government could assist the industry by instructing the State Railways to specify that all the coke that they purchase must be manufactured in bye-product recovery ovens. This would not be feasible just at present as competitive tenders for this coke would not be obtainable, there being only one plant manufacturing such coke for the open market.

One of the great drawbacks to the general introduction of bye-product recovery coke ovens, is the numerous small coal concerns who manufacture very small quantities of coke but whose aggregate production is large.

I do not consider that it would be a commercial proposition to instal plants of capacities under 30,000 tons of coal per annum. I would strongly advise that wherever possible plants of no less than 50,000 tons per annum should be installed. Such plants are much too large for many collieries, therefore the most economical way would be to instal plants in central positions common to a number of small collieries.

The following are the processes which could be adopted for treatment of various classes of Indian coal :—

- (a) *High temperature distillation*.—Manufacturing metallurgical coke, coal tar, ammonia and benzol.
- (b) *Low temperature distillation*.—Manufacturing soft coke or smokeless fuel, fuel oils and ammonia.
- (c) *Complete gasification of the coal*.—For recovery of the available nitrogen as ammonia.
- (d) *Combination of processes (a) and (c)*.—First submitting the coal to process (a) and then completely gasifying the resultant hard coke by process (c).
- (e) *Combination of processes (b) and (c)*.—First submitting the coal to process (b) and then completely gasifying the resultant soft coke by process (c).

Process (a)—The Jherriah, Giridih, some of the Barakar seams and Dishargarh coals are suitable for process (a). In the case of Dishargarh the coal would require compressing before coking to obtain a good hard coke suitable for metallurgical purposes. From tests made the bye-product yields from the Dishargarh seam exceed any other in India.

It is of extreme importance that only first class coals with minimum of ash should be used in the manufacture of metallurgical coke. There are many second class coals which make a hard coke of excellent appearance, but such coke, owing to the high ash content, cannot do other than hinder the development of the hard coke industry of the country.

Process (b)—There is a considerable market for soft coke or smokeless fuel in India and this market, in my opinion, is capable of great expansion as wood fuel becomes more scarce. I find that buyers and users of this fuel do not consider it important that it should possess a low ash content. They require it to be smokeless, easily ignited and above all to be cheap.

Most of the Indian second class coals are suitable for use in process (b).

Process (c)—This process would only be suitable for non-coking coals. It would be uneconomical in itself for treatment of any coal which is either saleable or suitable for processes (a) or (b).

There are many seams of coal which are not worked because of their high ash content; yet they could be as cheaply worked as those which are constantly being worked under all market conditions and, if completely gasified and the available nitrogen recovered as ammonia, be a considerable source of revenue to the country.

Processes (d) & (e)—These processes are suitable for unsaleable coking coals. The choice of the process which would suit any particular case would depend upon local conditions and the nature of tar or oils required.

All the colliery owners know the demand for hard and soft coke; many of them recognize that the demand must increase as more industries are established in India. They have little faith in the bye-products market of which they know so little.

There is a world-wide market for sulphate of ammonia at remunerative prices. The world's increasing production cannot keep pace with the demand. On this point, I beg to refer you to the statistics given in the last ten years' Reports of the Chief Inspector under the Alkali Act (Great Britain).

You will find, if the figures of market values over the same period were available that, in no instance, has the price dropped as the production has increased.

India is now using a small quantity of this salt as a manure. In my opinion, every effort should be made to encourage its further use, until the full production is utilized in India. It appears to me to be a waste of the Empire's resources, for India to export such a

valuable nitrogenous manure as sulphate of ammonia and at the same time to import nitrate of soda and other nitrogenous manures. The further use of sulphate of ammonia in India, would not financially benefit the producer as the whole production is sold on the basis of British prices.

The whole output of Indian coal tar is at present being sold in the crude state for painting, etc. It is quite patent to everybody that this demand will be limited, and that as the production increases, it will become necessary to find other outlets for the tar. The natural outlet would be the establishment of the coal tar distillation industry. This industry would be a very valuable one for the country, as it would make available many useful commodities, such as, creosote oil, for treating railway sleepers; carbolic acid the basis of the well known high explosive picric acid; benzene, the source from which aniline is prepared (and it is from aniline that most of the coal tar colours are derived); naphthalene, which is now largely used in India as a disinfectant and is also a source of other coal tar colours.

To give you a general idea of the usefulness of coal tar distillation, I may say, it has been estimated that from the tar produced from one ton of good coal there can be obtained—half a pound of magenta, which will dye 375 square yards of material; one and a half pound of carbolic acid, six and a quarter pounds a naphthalene, half a pound of anthracene (the starting point from which the beautiful series of alizarin colours are derived), besides a host of minor products used as medicines, as developers in photography, sugar substitutes, etc. Of colouring matters alone over three hundred owe their source to coal tar.

There is one bye-product which is not at present recovered at existing bye-product plants in India, i.e., benzol. Many people considered and some are yet of the opinion, that the recovery of benzol would be impossible in India, owing to climatic conditions. I have had considerable experience in the working of bye-product recovery plants in India; and after a careful study of the question, I have come to the conclusion that, provided the plant was designed on proper lines to suit the climate, the recovery of benzol would be quite efficient.

If benzol were recovered it could be used for motor fuel or utilized with more advantage for the manufacture of aniline, high explosives, and solvents for rubber and varnishes.

If process (c) was adopted, there would be available a large quantity of gas of a value of about 150 B. T. U. per cubic foot. This gas is very suitable for use in gas engines, which would cheaply generate electric power. The electric power could be used in electro-chemical or electro-metallurgical industries, or for general power purposes.

I have frequently been asked if it would be a commercial proposition to coke large quantities of second class Jherriah coal, simply to recover the tar ammonia and benzol and dump the coke which would be produced in such large quantities that a market could not be found for it. If such a plant were large enough it would be a success financially, but, from the economical point of view, it would be as sinful as the present deplorable waste of valuable bye-products in the Jherriah coalfield.

My experience shows that much has been done to improve the labourers' and mistries' Training of efficiency in constructional work by the importation of foremen from Britain who are labour and themselves first class craftsmen. It is rather difficult to select suitable men for this supervision. work, the men required are those who when they arrive in India will take up the tools and actually show the mistry how the work should be done. I find that the Indian mistry is not so conservative as is generally supposed. He has a great admiration for a man who is a better craftsman than himself and will adapt himself to improved methods.

I have seen carried out in this country a large amount of setting of refractory material by mistries who became quite as capable as British workmen and their finished work quite as good. I attribute these good results entirely to the skill and patience of the foreman and to the mistries' willingness to learn. The mistries so trained are now an asset to the country and to the particular industry under review.

I have found it rather a difficult problem to train the Indian labour to work a bye-product recovery plant efficiently without a large amount of supervision. The average labourer is quite willing to learn but he is hindered considerably by lack of elementary education and inability to grasp the most elementary principles of the industry.

The moderately educated Indian would be most useful in this industry if he would soil his hands by a little manual labour instead of his whole ambition being to obtain a "nice clean" clerkship.

I am of the opinion that for the bye-product and chemical industries generally, a number of Indians should be selected for training in various works. The training should not consist simply of assisting the existing supervising staff, the men should be employed in the actual working of the various processes, thereby gaining not only a knowledge of the actual working but also an inside knowledge of the labour, what it is capable of doing and what it is reasonable to expect of it.

ORAL EVIDENCE, 1ST DECEMBER 1916.

President.—Q. How long have you been in India?—A. About six years.

Q. Have you been engaged in chemical work all the time?—A. Yes.

Q. The question of increasing the number of bye-product recovery plants is largely one of the capital outlay that will be required in view of the fact that you can only organise work of

this kind on a large scale. I suppose that is the real difficulty?—A. There is no difficulty in finding the capital for it. The difficulty is to find the people in India who have confidence in the business.

Q. In what way will capital be found for a small concern?—A. You cannot have a small concern because it would be uneconomical in itself. The smallest plant I should recommend is one to deal with 30,000 tons of coal per year.

Q. You say that in 1915, 225,000 tons of hard coke were produced and you estimate the products that were wasted owing to failure to introduce the bye-product recovery plant, and then you go on to say that during 1915, 75,000 tons of soft coke were made in the Jherriah field and you say that there would be similar losses? I suppose you mean proportionately smaller losses?—A. Yes.

Q. Most of your note is quite obvious to any one who has taken an interest in the questions that you deal with. You say that Government should start an active propaganda to point out the advantages to colliery owners of coking their coal in a rational manner. What is it necessary to do in addition to what has been done? The history of the case is that in 1904 the Geological Survey published the proposal made at Giridih by Mr. Ward, who is the pioneer of bye-product coke in India, and since then the matter has been mentioned at various times before the Mining and Geological Institute. The Mining and Geological Institute practically includes, I understand, every colliery manager in the country so that in that way the subject is prominently brought to the notice of the colliery managers. What more can Government do?—A. The Government can take up the matter and put it before the colliery people from a disinterested point of view. We cannot expect them to take advice entirely from men who are interested in building the plant. If the Government or some one of these societies will put the matter forcibly it would be beneficial to the country.

Q. It has been stated openly and publicly that there is waste and it has been shown by actual demonstration at Giridih. I do not see in what way one can do more. The managers are well aware of the wastage and they have the opportunity of bringing it to the notice of the owners with regard to their own particular propositions. Can you suggest anything more definite and more efficient?—A. The colliery managers are well aware of the waste and I know many who have from time to time put the matter before their managing agents, who almost invariably treat the matter in a similar way to what the British Colliery Powers and Ironmasters did in England 20 years ago. May be the real trouble is that the managing agents are more interested in current dividends than in the results they would receive from the proper conservation of the coal. In my opinion the time is not far distant when the Government must recognize that people who waste the country's resources must be prevented by law.

Q. Am I correct in supposing that a few years before the war people at home neglected to put up benzol recovery plants simply because the price of benzol had gone down greatly. Except the ones that had already been in existence very few new benzol recovery plants were put up?—A. I do not think it was the case. There was a certain prejudice among a certain number of people who said that benzol was not a paying proposition. The benzol proposition has always been a paying one in England. Messrs. Simon-Carves, Ltd., have installed benzol plants along with every bye-product recovery plant they have built since 1888.

Q. You think it would be a paying proposition in India?—A. I think it would be in India.

Q. Have you put up one here?—A. There is not one in India yet.

Q. Your firm is ready, I understand, to put up plant for the sake of part of the bye-products. Are you in a position to gauge the conditions in this country and to adopt a system similar to that adopted at home?—A. We have made various suggestions and proposals to people out here, but they have considered it to be such a good thing that they have found all the money themselves.

Q. There would still be a good many who would probably prefer to give up the profits for the sake of avoiding the risk of the capital outlay?—A. We do not find it in recent years. Generally speaking, when coal owners seriously investigate the matter they would purchase the plants outright and thus reserve for themselves the whole of the profits.

Q. Have you found any special difficulties regarding the climate in carrying on the work in this country?—A. We have found difficulties. These have now been overcome by modifying the plant to suit the climate and simplifying wherever possible to suit Indian labour.

Q. Can you tell us what the precise difficulties were?—A. Mostly from the point of view of the difficulty of the complete extraction of the tar from the gases owing to the high temperature of the atmosphere and cooling water, also the loss of ammonia by evaporation from the crude liquor during storage before distillation. These troubles have been entirely overcome by recovering the tar by mechanical means without previously cooling the gases and by passing the hot tar freed gas directly into sulphuric acid for the recovery and manufacture of sulphate of ammonia.

Q. Would there be any serious loss of benzol on account of its low distilling point?—A. It would be necessary in India to instal refrigerating plant in connection with the recovery of benzol. This would add a cost of 1 anna per gallon to manufacturing charges.

Mr. C. E. Low.—Q. Do you think it would be an incentive if Government started the making of Trinitro tolnol?—A. Certainly it would.

Q. What amount of tolnol is yielded by ordinary coal?—*A.* Out of a thousand tons of coal we get approximately two thousand gallons of benzol, about 14 per cent. of this would be tolnol.

Q. Would you suggest that the producers should make T. N. T. or that Government should do it?—*A.* It would certainly be better for Government to do it. An expert staff would be necessary for the manufacture of T. N. T. The collieries and ironworks would have quite enough to do if they recovered the bye-products and left it to the experts to work them up into T. N. T.

Q. What is this soft coke used for and who uses it?—*A.* It is fairly extensively used all over India.

Q. For domestic use?—*A.* Yes. The natives burn it all over the country wherever they have not got cow dung or wood.

Q. How far does it go?—*A.* The business is entirely in the Indian merchants' hands and they are the only people who could give this information.

Q. Is any Indian coal tar at present exported?—*A.* No.

Q. Have you made any experiments in low temperature distillation?—*A.* To some extent. Our experiments were cut short owing to the war as shortage of staff took place, but the results we obtained were very promising.

Q. You think that the coals are suitable?—*A.* The coal is suitable and cheap.

Q. Have you tried the different kinds of coal with a view to find which is the most suitable?—*A.* We have tested most of the coals in the laboratory and practically all the Jherriah coals.

Q. And also the Ranigunj coals?—*A.* The slack coal must be taken out of these coal for low temperature distillation.

Q. Do you find the Ranigunj coal useful for these experiments in low temperature distillation?—*A.* The Barakar series are better and give very exceptional results. In that series we get a yield of nearly 40 pounds of ammonia per ton.

Q. Have you placed your results at the disposal of the Director of Geological Survey?—*A.* All our tests have been done for private individuals.

Q. When it has passed the stage of interfering with private interests would you be free to do it?—*A.* Messrs. Simon-Carves, Ltd., Manchester, would be pleased to put our results of tests of Indian coals at the disposal of the Director of Geological Survey.

Q. Assuming that the Director approves of your results that would help you in the propagation?—*A.* Quite so. Yes.

Q. Merely for want of information many of these things are inactive?—*A.* Yes.

Hon'ble Pandit M. M. Malaviya.—*Q.* You say that the average labourer is quite willing to learn but that he is hindered considerably by lack of elementary education. Do you think that if he had a little more primary education supplemented by industrial education that would be better for him and for you?—*A.* Yes. He would be more useful.

Q. So that in your opinion the money spent on primary and industrial education will be a direct encouragement to the industry?—*A.* I think so.

Hon'ble Sir R. N. Mookerjee.—*Q.* You represent your home company?—*A.* Yes.

Q. May I ask you the name of the firm?—*A.* Simon-Carves, Ltd., 20, Mount Street, Manchester.

Q. You say that you could put the plant for the coal industry if the sale of the products could be guaranteed?—*A.* This only refers to benzol and tolnol, as far as the other products are concerned there is already a certain market in India.

Q. If the security was good what will be the condition?—*A.* This is a matter which could only be decided by the Director of the firm I represent.

Q. What quantity would you ask the Government to take?—*A.* The whole output of a plant. I understand this matter has already been put before Government who rejected the proposal.

Q. Government might find it expedient to change this attitude. Could you write a confidential note to the President?—*A.* I shall do that.

President.—*Q.* The question is one of importance in this way, that there are some people who would lay out the capital for bye-product plant on condition that the bye-products were purchased for a certain number of years so that risks may be avoided. I know that in the earlier days you were not prepared to undertake terms of this kind as you knew nothing about the market for the bye-products. Now after this experience of ten years you are able to move along these new lines?—*A.* We are in a position to do that. We know the Indian market for bye-products with the exception of benzol.

Q. You might make a general statement to the effect that a certain portion is to be taken for a certain number of years so that the concern may have an assured future?—*A.* I have already mentioned that, with the exception of benzol, the sale of the various bye-products presents no difficulty.

Q. It would do quite well if you could give us a statement* confidentially as to the quantity you would expect Government to purchase in order to justify your putting up an

* Not received at the time of going to Press.

installation plant and also the extent to which your firm would be prepared to supply recovery plant?—A. I could do that quite well.

Dr. E. Hopkinson.—Q. You say that you are able to eliminate tar from gas. May I take that as a categorical statement?—A. We are doing it successfully in India.

Q. Without reduction of temperature?—A. Yes.

Q. Can you make the gas so free from tar as to be suitable for use in gas engines?—A. Yes, however it would not be practicable to use hot tar free gas in gas engines owing to the fact that in practice the gas after being freed from tar is at a temperature and dew point of about 60° C. and is therefore fully saturated with water. It can be understood that it would not be economical to allow all this water to pass along with the gas to the engines. It is necessary to cool the gas down to atmospheric temperature to eliminate the excess water. I am also a great advocate of further purification of gas for gas engines by roughly purifying with iron oxide.

Q. That is a new proportion?—A. We have used it for the last six or seven years.

Q. You get rid of the tar by cooling?—A. We get rid of the tar entirely by mechanical means.

Q. I see from your calculation that you take the ammonia at 22 pounds per ton? Why is it so low?—A. I have made it low so as to give a safe calculation. Some of the Indian coals give very low yields.

Q. Is that a fairly safe calculation?—A. Yes.

Q. Do you think that the difficulty of obtaining sulphuric acid acts as a bar to the adoption of your plant?—A. I do not think so at all. We are able to arrange for acid supply to any plant installed by us.

Q. So far as your experience goes there has been no difficulty?—A. No.

Mr. A. Chatterton.—Q. Have any attempts been made to popularise the use of soft cokes for domestic purposes by providing proper apparatus for burning them in?—A. Not as far as I know.

Q. Has any proposal been made to get these soft cokes briquetted?—A. There is a scarcity of pitch in India.

Q. Is it essential that you should use pitch. Would not the tar do?—A. You must have pitch, tar is unsuitable. The minimum amount of pitch required is about 5 per cent. with special coke and for ordinary work about 7 per cent., hence the cost price of briquettes would be far above the market rate for first class coke.

Q. Is the market for these bye-products entirely outside India?—A. The tar is sold in India. Part of the ammonia is exported. The use of sulphate of ammonia in India is increasing every year.

Q. Do you know whether it would be better to use benzol mixed with alcohol?—A. That is a debatable question. It would, in my opinion, be more economical to mix it with alcohol.

Q. Do you know whether if benzol was mixed with alcohol, the alcohol would be sufficiently denaturalised for practical purposes?—A. I think so. I would not drink it afterwards.

WITNESS No. 95.

Mr. B. Starks
Field.

Mr. B. STARKS FIELD, Manager, Pandakonali Coal Co., Ltd., Loyabad, Banajora Post Office, Manbhum.

WRITTEN EVIDENCE.

Coal mining.

My experience relates especially to the practical part of coal mining in the Jherria coalfield, and the following are some of the directions in which I consider improvement and further development of the industry ought to be sought after.

Regulation and
control of labour.

Unless something is done in this direction great improvements in the efficiency and output of the collieries cannot be expected.

As the pits get deeper, the workings more complicated, and the use of machinery extended, it becomes more and more important that the working of the mines be carried out systematically.

At present there is much valuable plant installed at many collieries capable of dealing with much greater outputs than are at present being produced. Under present circumstances this machinery is generally standing idle for a large portion of its time, neither giving the investor the proper profit on his outlay, nor contributing its fair share to the produce of the country.

This is not due to the fact that an increased output could not be disposed of, but to the irregular habits of the miner. The miner goes to work or leaves practically at whatever time he feels inclined during the day or night. The result of this is, that the winding apparatus has to be at his disposal when he desires, often seriously interfering with the work of raising coal; the underground system of haulage is disorganised, and the result is a general loss of efficiency all round.

It is a common practice in certain districts of the coalfields for a miner and his wife to work 24 hour shifts, and of course as no miner can work 24 hours on a stretch, much of this time is wasted underground in sleeping and idling, with the consequent loss of efficiency. This practice from many points is most undesirable, not the least of which is the disadvantage to health which must accrue from spending so many hours at a time underground.

It may be said that these conditions could be easily remedied by the management, but when it is considered that many collieries are grouped closely together in more or less congested areas, and that none ever have an adequate supply of labour, any pressure in the direction indicated would mean that the labour would promptly walk off to a neighbouring colliery where no restrictions were being imposed.

I feel sure that if a system of regular shifts could be made compulsory by law, it would be greatly to the benefit of the industry.

I would divide the day into two shifts, i.e., the day shift and the night shift, and that miners be allowed to descend on the day shift before 6 A.M. or after 8 A.M., and except in cases of sickness or accident no miner to be allowed up before 4 P.M. and that all day shift labour be out by 6 P.M. The same hours to take effect in the night shift. In Britain miner's shifts are regulated by law.

Beyond the interest taken in the labourers by individual managers and assistants, I am not aware of any effort that has been made to improve the labourer's efficiency and skill in the mines. As a matter of fact I cannot suggest any means by which this could be done effectively, as the skill of the miner can only come from his strong arm and his individual experience at the coal face.

With regard to the training of other workmen employed underground, such as timbermen, line khalassies, etc., the only way to improve their efficiency is by giving them practical instruction in the mine, and by placing them along with superior and better skilled men.

For those who aspire at higher posts, such as subordinate officials, great good could be done by a system of night schools, to which the workmen could attend without interfering with their daily duties.

In England the best subordinate officials are generally selected from the steadiest and best workmen and my experience in this country is that men who have been practical working miners make better overmen and sirdars than men of better education who generally start work at the mines as munshis.

Properly arranged night schools would specially benefit this type of man and improve his efficiency.

With regard to the training of apprentices who are designed for the supervising staff and for managers, it is a matter of great importance that the young men should have a sound elementary education, before beginning their apprenticeship, and that they should regularly attend technological classes during the period of practical training in the mines.

Much good work has been done by the local technical evening classes in the coalfields, but the lecturers have always been hampered by a lack of elementary knowledge among most of the students. To get over this difficulty, further classes could be held on other nights covering the elementary ground required by the students to enable them to take full advantage of the technical classes.

I am of the opinion that the mining course given at Sibpur College would be of much more value if it were coupled with practical experience at the collieries. Mining being a profession that can only be learnt in the mine, I consider that all mining schools ought to be adjacent to the collieries.

My experience of the Sibpur College boy who has completed his mining course away from the collieries is that he thinks he has learnt his profession (although he may not have seen a colliery except at the annual camp held in the coalfields at which he may have attended twice or at most thrice) and only now needs to put in the necessary practical work the law requires for him to sit for his colliery manager's examination and to get his certificate, which he thinks will be his cheque book for life.

If the mining school were established at Dhanbaid or Asansol, the mining student would have the opportunity of combining his daily tuition with practical demonstrations at the various collieries, and also (what is most important in my opinion) give him some practical idea of the duties and responsibilities that will devolve on him in his future career.

As a mining college it could also form a technological institute for colliery apprentices and subordinate officials for whom special lectures could be given.

With regard to this subject, at present it is not necessary for engineers in charge of prime-movers to be certificated in this province, and unless an engineer can produce a Board of Trade certificate, or one of the certificates granted in other provinces, there is no guarantee of his knowledge or ability to take charge of machinery.

Many incompetent men, calling themselves engineers, are constantly seeking employment, their ignorance often only being discovered after damage has been done to machinery placed under their charge.

I consider it would be a good thing to have a standard mechanical engineer's examination held throughout British India once a year at the same date and time, for men who are usually in general charge and responsible for the running and repairing of machinery.

Training of labour
and supervision.

Apprentices and
mining students.

Mechanical
engineers.

Although the machinery employed in the various industries of necessity must vary considerably, in design the principles are technically the same. As much of the machinery now employed is electrical this examination could cover the necessary ground; or a second examination could be held for electrical engineers who have first obtained their mechanical engineer's certificates.

Khalassies.

Men, such as engine drivers, boiler-minders, and pump-men, I think should pass suitable tests before being placed in direct charge of prime-movers. This would undoubtedly raise the standard, tend to efficiency, and save much damage that is frequently done to machinery and plant, owing to neglect and ignorance.

Workable coal locked up.

With regard to the supplies of raw material the use of which is restricted by preventible causes, I feel that the great amount of valuable coal that is locked up under ordinary colliery sidings comes under this head.

At present the usual custom before the railway company serves a colliery is, that it acquires under the Land Acquisition Mines Act the necessary land for a siding *plus* a considerable strip on each side which is considered necessary for support.

The railway company then immediately imposes restrictions on the working of the coal existing below the acquired land. Therefore a colliery to be served with a siding must relinquish the right to work a large proportion of its available coal. This coal so locked up, is undoubtedly a very serious loss to the colliery company, and of course to the country.

If collieries were served by their own private sidings, and gave a guarantee, or in some cases a deposit to the railway company to cover all probable damage to any rolling stock due to any subsidence, then the collieries could work the coal under their sidings as they found best, and in cases of total extraction they could create suitable diversions to serve them during the period of subsidence, and if found advisable after the subsidence had settled could again bank up the original line, and relay the rails.

If these methods could be adopted they would immediately liberate for the market a large amount of coal now locked up.

Why the railway company should acquire a strip of land generally overlying a considerable part of the best workable seams of every colliery it serves, and then imposes absurd mining restrictions upon all the coal underlying those sidings, I, from the point of view of one whose duty it is to mine and bring to the surface in a marketable condition a maximum amount of mineral from the area under my jurisdiction, cannot understand.

Every ton of coal so locked up, is a loss to the country and to the world at large, because in cases where a colliery extracts the coal on each side of the acquired land, the coal left for the support of the railway siding would be locked up and lost for ever, as it would not pay to sink pits only to recover this coal once the area was goafed.

Economical working of the available resources of first class coal.

There is no doubt but that our present methods of mining coal are wasteful, and in so far as is known many of our best coals, which are rapidly being exhausted, cannot be replaced by seams of the same quality; therefore every possible endeavour ought to be made by Government to reduce this waste to a minimum.

The total extraction of thick seams by the "bord and pillar" method, which is generally in vogue, is practically impossible; besides, much good coal has been and is being lost by making the original pillars too small, thus making it impossible to subsequently extract them.

Of course, this method of working gives a quick return, and also means a cheap cost per ton for a colliery during the earlier part of its life, but whatever gain is made in this direction is much more than lost by the increased cost of working at some future date.

I would suggest Government appoint mining experts and others to consider the best and most economical methods of working for the benefit of the country, and report on it.

The lines I would suggest would be the consideration of the replacing of the coal extracted by means of other material brought from the surface.

What is known as hydraulic packing has been carried on successfully in European countries, and having regard to the fact that the Damuda river, from which a vast amount of sand is available, flows within a few miles of most of the collieries, there is no doubt that this store of material could be conveniently used for the purpose of packing.

There are certainly difficulties in the way of this suggestion, all of which could, I believe, be surmounted, and if hydraulic stowing could be adopted, it would give us the following advantages:—

- (1) all questions of support to the surface would be a thing of the past;
- (2) the present dangerous system of extraction of the pillars would no longer exist;
- (3) underground and job fires would be unknown;
- (4) practically the whole of the remaining portions of our first class coals would be won and utilised.

These advantages would more than outweigh any primary consideration of quick return and abnormally cheap working.

How Government could assist future development.

The Government might greatly increase the knowledge of the conditions of the seams in the coalfields by a regular system of borings to the dip, as by this means the existence of valuable coals may be proved, which, if discovered, would undoubtedly attract capital in the future, and also enable a better estimate of the mineral resources of the country to be made.

Governments of European countries have undertaken this sort of work with beneficial results.

The knowledge gained by the Geological Survey of India has proved a great boon to the mining profession, but in so far as the present coalfields are concerned, I feel that much more valuable information could be gained by deep borings in the known coalfields.

There is no doubt that at present our methods of utilising coal are exceedingly wasteful, and in the light of our present knowledge I am of the opinion that no coal at all ought to be consumed for heating purposes as coal, but ought to be entirely converted into the various commercial products that can be obtained from it, and for which there is a worldwide market, the residue coke and waste gases being utilised for steam raising and other heating and power purposes. Utilisation of coal.

There are of course many difficulties in the way of this ideal, and it is undoubtedly far off yet, but this is certainly the direction in which to look for economy and industrial development in the coal trade.

Coke is made fairly extensively in the Jherria coalfield in open ovens, and in many cases coal is partly carbonised in open heaps and converted into what is known as soft coke. This is without a doubt a sinful waste of the country's resources, a remedy for which is happily appearing on the horizon of the future.

Bye-product coking plants are beginning to spring up in the coalfields, and will most probably be the forerunners of others, as the products extracted rapidly create lucrative markets.

The great obstacle to the development of the bye-product industry is the initial expense of the plant which is much too great for most colliery companies to undertake.

This difficulty could be got over by the smaller colliery companies, many of which are controlled by the same agency, combining to form bye-product coking companies, which would take over and deal with practically their entire output of slack.

This industry could be greatly assisted by the granting of special carrying facilities for the slack and coal from a group of collieries to the central bye-product plant.

As the industry develops a large quantity of cheap coke would be thrown on the market which would make it worth while for steam users to consider seriously the question of coke fired boilers.

ORAL EVIDENCE, 1ST DECEMBER 1916.

Q. President.—How long have you been out here?—*A.* Ten years in the Jherria field with the exception of about three months at Saltore in the Ranigunj district.

Q. You have seen something of the working of the evening classes for young apprentices?—*A.* Yes, I was a lecturer for three years.

Q. We were told yesterday that these classes had gone down in attendance since Mr. Griffiths' time. Could you give us any idea as to why they are dropping off in attendance?—*A.* I don't know what the attendance is at present, but in 1912-13 I used to have about 20 students.

Q. They were trained up to the first class certificate?—*A.* It is practically impossible to do that with the class of men we get. The greatest difficulty we had was that a student had not a sufficient elementary knowledge to understand the lectures, and a considerable amount of time had to be spent on instruction that ought not to have been necessary.

Q. Would you propose to get over that difficulty by establishing an elementary night school on the coalfields?—*A.* I would suggest that, not quite for the same class of man but for the subordinate officials.

Q. So you want three or four different types of schools?—*A.* The first I want would have to be evening schools, similar to what we have at home, where we could teach mining, and also on other nights have lectures on mathematics, machine construction, and other subjects that would assist mining students.

Q. With distances that are very great, would it not be a more effective form of instruction to have, instead of evening classes, a few days of work put aside or a certain number of months in the year?—*A.* On the Jherria coalfields distances are not so very great. There are a number of large collieries round Sijua, where there are good roads. Most of the students have cycles. In the Jherria Division you have another group of collieries and in no case has a boy to travel a very great distance. It would be a matter of two or three miles at the most.

Q. You think the difficulty would be got over by multiplying these schools, so as to set them up in most convenient centres, or a larger number of convenient centres?—*A.* Yes.

Q. How are you going to finance these many schools; do you want Government to pay for them?—*A.* Yes.

Q. Government does not get any money out of your coal trade?—*A.* The coal trade certainly ought to assist.

Q. What about the royalty owners, do you propose to squeeze them too?—*A.* Yes, certainly.

Q. How is it going to be done: with the Permanent Settlement of Bengal?—*A.* That is a detail which will have to be settled.

Q. It is very easy to propose that Government should pay for all these things, but Government is not getting any revenue out of your coal?—A. The country is certainly getting a good deal out of the coal trade.

Q. If Government has to pay for these things, it has to get somebody else to pay and that somebody is the unfortunate raiyat, so that you would make the raiyat pay for setting up competition for labour?—A. I am certain that most of the large firms of standing would be very willing to contribute to it if approached, because they would do it in their own interests.

Mr. C. E. Low.—Q. Are you aware of what the conditions are in Bengal and Bihar and Orissa? Are men not allowed to be in charge of steam boilers who do not possess, at any rate, a third class certificate?—A. Men are allowed to be in charge of boilers in the Bengal coal-fields without a certificate.

Q. Up to what size boilers?—A. Any size, there is no restriction as far as I am aware. The only restriction is that the boiler has to be examined once a year by the Boiler Inspector. The boiler man has no certificate.

Q. No boiler is allowed to be worked unless there is somebody who is supposed to be in charge of it possessing, at any rate, a third class certificate. That is the law which I understand is in force in most parts of India. Is there nobody about the place that has got this certificate?—A. It is not in practice in the collieries, and I have never heard of it before.

Q. How would the coal mining interests regard your proposal of compulsory shifts; would they be in substantial agreement on the subject or would there be much difference of opinion?—A. I think they would practically all agree.

Q. You consider that the present mines inspecting staff would be capable of seeing that it was enforced, or would they require to be increased to do so?—A. I hardly think there is sufficient inspecting staff to see to it.

Q. I suppose you would manage as they do at home, not by factory legislation, but by legislation under the Coal Mining Act?—A. Yes.

Q. That would prevent you from having two sets of Inspectors for looking after the same things in the same mine?—A. Yes, it would do that.

Q. Do you propose to have standard mechanical engineers' examinations throughout British India once a year at the same time and date? You may take it from me that in most provinces in India, at any rate, a man is not allowed to be in charge of steam boilers unless he has a certificate for which he must have had a certain amount of practical experience and have passed an examination held by the Board in each province. Was that recommendation of yours made in ignorance of the fact that I now tell you, that many provinces, at any rate, do have an examination?—A. I was aware that there were examinations in some provinces, but not in Bihar and Orissa.

Q. Would your recommendation apply also to other things than steam boilers; would it apply to oil engines, for instance?—A. Certainly, but I propose here to have two sets of certificates. I should have another suitable test purely for pump-men and other men in charge of machinery. The first certificate would be for colliery or mill engineers, who are very distinct from engine drivers.

Q. You have no experience of any inconvenience caused by the fact of certificates given in one province, under the present rules, not being accepted in an other province?—A. I have had no experience of that.

Q. Do you consider that the amount of coal locked up on sidings could be diminished by the use of ropeways?—A. Yes, to a certain extent, but there would always have to be sidings. We have collieries where there are four or five sidings, and have to load one or two wagons at each siding. I think it would be a good suggestion to concentrate loading at one siding and save the coal locked up under the others. The railway company acquire land before putting a siding down and they will not relinquish it, as they want the land for their own purposes to carry the line through to some colliery outside. I know of such cases. There is one very small colliery in Jherria where there are 3 million tons locked up on account of restricted working, and another 2 millions in my own colliery, making a total of 5 millions, and another 3 millions in a third colliery, making 8 millions in three collieries practically adjacent to each other.

Q. You suggest the colliery giving security to the railway company against damage by subsidence to rolling stock; you would also make them give security against killing a driver or a guard?—A. Yes, we would have to do that. Even at present the railway company hold responsible for any derailment on a siding, and there have been quite a number of cases where the collieries have had to pay for damage to rolling stock, so the liability in regard to guarantee would not be increased in any way.

Q. There are other ways of doing it than that perhaps?—A. (No answer.)

Hon'ble Pandit M. M. Malaviya.—Q. With reference to your answer regarding cost of night schools, have English labourers, before they go to work in factories, received an elementary education at the cost of the State?—A. They have all received an elementary education at first at the cost of the State but no technical instruction.

Q. You are aware that there is free and compulsory education provided in England for every boy and girl, at the cost of the State, and you think, therefore, that in India also every boy and girl should receive elementary education at the cost of the State?—A. I do.

Hon'ble Sir F. H. Stewart.—Q. Your proposal of the division of the day into two shifts, would that upset the labour?—A. It might at first, but my object is to get labour working with some sort of system. At present there is no system at all. They come and go when they like; they are very casual and very independent.

Q. Has it been tried anywhere?—A. No; I don't think so. I don't think it can be done by voluntary effort. None of the collieries has sufficient labour and go hunting for labour, and unless the colliery managers and labourers are loyal to each other, it cannot be done.

Q. Do you settle your labour on your own land?—A. Yes, we have a certain proportion settled on our own lands. We do what we can in that direction. But there are many collieries who have nothing to do with the surface rights, and ordinary raiyats live on the colliery property.

Q. With the result that labour is gradually getting more settled?—A. To a certain extent. There are, however, many difficulties in the way. Most of these lands are owned and cultivated by villagers who live on colliery property, but do not work in the mines. That is one difficulty.

Q. If you can settle your labourers on your own land, they would be much less likely to go over to a neighbouring colliery?—A. Yes, we have quite a lot, but nothing sufficient for our requirements.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. How many hours do these labourers work?—A. The miners who go down the pits come about 6, 7 and 8 o'clock; in fact they come all day long. I don't think the miner works actually 3 hours a day at the face. He goes down the pit, sits at the bottom of the shaft, has a smoke, talks, and goes to sleep, gets up and works when he likes and comes out of the pit up to 8 o'clock at night.

Q. What is their income generally per month?—A. We generally pay 6 annas a tub and a miner fills one or two tubs a day, he and his wife and family. There is no reason why a man should not fill three tubs.

Q. I suppose he gets more than he can spend, and therefore he wants leisure?—A. Yes, that is one of the reasons. He does not require to work very hard. None of them work the full week, three or four days are quite enough for them.

Q.—How does he spend his earnings?—They spend a lot of time out of the mine; probably they go back to the village for a fortnight or three weeks or a month.

Q. Are they cultivators too at the same time?—A. Practically all of them are.

Dr. E. Hopkinson.—Q. Will you refer to the para. about mechanical engineers in your written statement? The first part relates to the working of steam boilers and prime movers. Then you go on to suggest that there should be a standard mechanical engineer's examination for all kinds of engineers, whether they are engaged upon steam boilers, prime movers or as mill engineers?—A. Where they are placed in general charge of machinery, but I don't mean in direct charge, such as engine drivers.

Q. And you suggest a standard mechanical engineer's examination throughout India. Do you mean an examination by Government which would carry the grant of a certificate or diploma to those who pass it?—A. Yes, similar to a ship captain's certificate or a colliery manager's, showing that he is capable of taking up such duties.

Q. Some of those certificates go much further; they mean that a man is not to engage in such duties unless he holds a certificate. You don't mean that?—A. Yes, I do.

Q. You mean that a man may not be employed as an engineer until he holds a certificate; do you think that is feasible?—A. A man at present is not allowed to be engaged as colliery manager until he has gone through a training and got a certificate.

Q. Do you think that could be extended to all engineering work?—A. I think it ought to be. I think it would certainly raise the standard.

Q. You mention a particular instance, viz., electrical engineering work?—A. In the collieries the electrical machinery is increasing every day, and it is quite a common practice that the man in charge of the boilers and steam engines also looks after the electrical plant as well.

Q. You think that anyone in charge of electrical machinery ought to be licensed by the Government?—A. Certainly, I do.

President.—Q. In your written evidence you advocate that Government should appoint "mining experts and others to consider the best and most economical methods of working for the benefit of the country, and report on it." Why don't you put matters of that kind before the Mining and Geological Institute? If a small committee be appointed to go into it, would that not meet your case? You don't want Government to interfere with industries where there are a large number of qualified men carrying on the work?—A. That would meet the case.

Q. It is no use our tampering with things for which there is machinery already provided in this country. The Mining and Geological Institute is doing good work, and we want to see that machine turned to account. The same remarks apply to the question of hydraulic packing. The Institute will follow that up in the same way, and the information will get to the right man.—A. (No answer.)

WITNESS No. 96.

MR. GULABRAI, Agent, Benares Bank, Limited, Bhagalpur.

WRITTEN EVIDENCE.

Capital.

Whatever may have been the condition of capital in India some years back, I do not believe in the theory of the habit of hoarding to any great extent in India at present. Capital is no doubt shy, but not because people do not want to take any risk involved in investment in newly starting industries. I am able to say with confidence that people are becoming alive to the advantages, individual and national, which will accrue by the employment of their savings and surplus money in industrial enterprises whose prospects have been established by a thorough and careful examination by experts. The four circumstances that undisputably make the capital shy are :—

- (a) Want of business morality giving rise to bogus concerns intended to cheat the public from their very inception. Such was the case with some banks which resulted in collapse and thus had the effect of retarding the tendency towards greater confidence which was slowly growing.
- (b) Want of experienced entrepreneurs.
- (c) The ignorance of the investors as to the nature and conditions of the business in which they are sinking their capital.
- (d) Almost passive economic attitude of the British Government with respect to the industrial development of the country.

The people are prepared even to ignore circumstance (c) when drawback (b) is removed but condition (d) is the all important consideration.

Capital generally comes from the middle class who are generally educated. The idle and the ignorant rich generally do not contribute. The reason is not far to seek. The unenterprising character of the rich is only too well known to need special mention. They don't want to trouble themselves with anything beyond what conduces to their material comfort and enjoyment. Yet this is the class of persons from which the capital in major part should be derived.

To induce the middle classes to invest their savings in industrial enterprises to a greater degree, we have only to make the circumstances more inviting. We must try to remove the three drawbacks (b, c, d) mentioned above which specially deter the middle class. The circumstance (a) is of course beyond our control, which depends as it does, upon circumstances beyond effective human control. Time will alone remove that defect as it has done in all industrial countries.

The want of capable entrepreneurs will continue to be felt for some years to come. In this matter the whole blame should not be thrown on the shoulders of Government. The people for a long time did not look upon technical education with favour, partly because of their considering it an undignified profession, partly because of the want of prospects in that line and partly because of the absence of facilities for acquiring that knowledge. But even when they have begun to recognise the importance of this branch of study, they persist in sending the fools of the family for that branch of education. Parents ignore the fact that to make a successful entrepreneur, as much intelligence, knowledge and resourcefulness are necessary as in the acquirement of any branch of knowledge. Then comes in the impatience at having to begin at the lowest rung of the ladder, of our youngmen who after undergoing a course of special education in foreign countries are anxious to embark on industrial careers. This attitude of our young ambitious students is not praiseworthy. They must know that they must establish their reputation for efficiency, resourcefulness, determination and persistence, before they can expect to be placed in responsible posts and before large concerns can be entrusted to their management.

The Government also has to share the blame. It is primarily the function of the State to create such an atmosphere of industrial education as to make good entrepreneurs. In this the Government has done very little, almost nothing. To make successful conductors of industries, we want firstly a diffused knowledge of science, secondly technical schools to increase the skill of our craftsmen to facilitate the work of the entrepreneurs in training the labour, thirdly demonstration factories to bring this knowledge home to the people in a practical and instructive manner; and lastly a widely diffused knowledge of the science of economics to enable our young people to study the forces of demand. In short the Government should make science the "handmaid of industries." Till a scheme for the diffusion of scientific education matures, Government ought to provide a large number of scholarships to enable the best students to acquire scientific and technical knowledge in foreign countries like Japan, America, England, etc. Government also should provide facilities for our young men returning from foreign places after acquiring knowledge, to enable them to have a practical training to make them fit for starting new industries. In fact we want our Government to bestow paternal care upon her almost neglected children.

To remove the obstacle (c) mentioned above, Government should arrange to inform the public through vernacular papers, about the character and prospects of the industry about to be started. Government should also invest its own capital in some proportion to assure the

public of the safety of the enterprise. The advantages of this will be nullified unless Government makes the contribution of at least half the capital by Indians a binding condition. Otherwise the evils arising from investment of foreign capital will continue to remain.

Above all we want Government to relax the rigidity of their almost passive economic attitude towards industrial development of the country. They should conduct a scientific survey of the resources of the country with the help of Indian and European business men; by placing that information of the survey before the people in an instructive manner; by ensuring a demand for the goods produced by giving to the products of indigenous industry their own custom, almost unconditionally, by providing better transport facilities to indigenous products in the form of special commercial rates to enable the undertakers to stand the competition of foreign goods and even by deviating from the strict free trade policy.

To induce the lazy rich to come out with their money we may safely presume that ordinary influence will be of no avail. So Government help is necessary. This help can be rendered, if the Government so desires, firstly by a judicious distribution of honours amongst the persons engaged in commerce and industry in recognition of the services rendered by them in regenerating the industries of India, their mother country, and by the paternal inducement and pressure of the executive officers and their sympathetic encouragement.

Capital can come from the class of the Mahajans and the moneylenders as well. But so long as it is possible to lend money to agriculturists at heavy rates of interest on the security of crops and oftentimes land, few of these Banias will be attracted by the comparatively moderate dividends which modern enterprises in the face of keen competition can offer. These people will be compelled to divert their capital to industries, as the perfection of the co-operative credit movement is bound in course of time to lower the rate of interest all over the country.

The wealth of the villages which is now so largely and wastefully employed in useless festivities, grand funeral ceremonies and litigation, can also be diverted to industrial enterprise in cottage industries, by giving the masses free and compulsory primary education which is sure to exercise an elevating influence upon them.

Industries on a large scale should receive either money grants-in-aid or bounties and subsidies. Premiums can be graded at will in such a manner as to protect those producers that most need protection and not the others. This system does not purport to be anything else than what it really is, namely a "sacrifice imposed upon the nation for reasons of public utility." The public knows that it is paying for this protection and knows exactly what it pays. The special advantage of this system is that the prices will not go high. But there is one serious danger arising from such a system which we should take particular care to remove. The authorities in charge of the disbursement of premiums, should not only be highly experienced in the intricacies of business, but also known for integrity and impartiality to avoid the possibility of the danger of favoritism coming into play, causing serious damage to some industries and giving unfair advantage to others.

I am not in favour of guaranteed dividends for a limited period. The same evils which appeared in the guaranteed railway system may be expected to re-appear. The promoters of industry will be relieved of all the responsibility and incentive to economy save that supplied by the prospect of an eventual share of surplus profits, in excess of the guaranteed interest. No doubt controlling officers will be appointed and a system of audit will be introduced, but there are the dangers of the officers turning out inexperienced and audit being defective. These two defects presented themselves under the guaranteed railway system. The guarantee system is bound moreover to invite foreign capital, only to exploit our country the more.

Loans may be granted in the case of circulating capital but not in the case of fixed capital. As far as possible we must avoid long period loans. I prefer Government's investing some proportion of capital in the industries as loans to the companies with or without interest.

The system of supply of machinery on the hire purchase system should not be resorted to. This will only give advantage to the individual manufacturer at the cost of the public money. It is only human nature not to take care of the things belonging to others when taken on hire and to make the most of them. However, this may be resorted to in the case of cottage industries through co-operative societies of artisans. These industries can be revived and improved to suit the public taste by providing them with up-to-date machinery and implements and loans at first without interest and afterwards with reasonable interest.

It is only proper and just for a Government calling itself paternal to ensure the sales of a commodity when the industry is in the infant stage. It is only gradually that a factory can produce a particular commodity to suit the taste of the public. It is therefore necessary that provision should be made for the consumption of its articles produced in the beginning. This system appears to be the best of all systems. This is the system least liable to remove the necessary everlasting incentive to arrive at efficiency, for there will always be present the danger of the custom being snatched away, if no attempt is made to improve the outturn and to produce it cheaply. The failure of the swadeshi movement in India is well known. The promoters of the newly started industries relied too much upon the spirit of sacrifice and patriotism which the swadeshi movement gave rise to, and believed it to be permanent with a result that the industries suddenly collapsed. It was not surprising news to those who were cognizant of the fact of poverty and the lack of the spirit of nationality in India and knew for certain that this sacrifice on the part of the public was only temporary.

Government control is necessary in paying guaranteed dividends for a limited period, in the supply of machinery on the hire purchase system and in providing a part of the share capital.

Pioneer factories.

The scheme of pioneering industries should not be resorted to by Government. I consider this as beyond the functions of the State, for it will increase the work of the already overburdened Government and result in inefficiency owing to the diffused attention that the Government will pay. Moreover such a system is undesirable because it is bound to undermine the initiative of the people.

Financing agencies.

Financing of industries by the existing joint-stock banks does not at first look practicable. There is enough of capital with the joint-stock banks to help industries, but they cannot take upon themselves that element of risk which the present system of banking involves in lending for long periods. The joint-stock banks can lend capital for short periods only, i.e., the banks can lend to overcome difficulties arising from a deficiency of circulating capital. Under certain arrangements the banks can lend for fixed capital as well. If Government can guarantee to help banks in times of distress, to the extent to which they have invested in industries, I do not see any reason why the banks should object to lend from the reserve fund. The bankers should be only too glad to lend, for their reserves which otherwise remain idle will yield an income. This system has its limits. It can be utilised only for industries which are already established and are capable of expansion, but cannot expand for want of capital, or for industries the prospects of the success of which are almost certain.

A better method of financing industries is to start new industrial banks on the lines on which similar banks exist in Japan and Germany. The capital of such banks may be raised either by one of two methods suggested below or by a combination of both methods in one. The first method is to issue shares like the present joint-stock banks. To make these banks free from periodical crises, in times of panic, it is necessary that deposits should not be accepted.

This method perhaps will not secure investment of requisite capital because of the remote prospects of profits which it will hold out to the investors.

The second method is to provide capital by raising public loans on lines similar to those on which other public loans are raised by the Government. The joint-stock banks will only be too glad to contribute their quota. It is possible that the appeal of the Government may not bring forth the amount needed. But this repulse should not discourage the Government, for in that case the Government can avail itself of an external issue of capital.

With this arrangement capital can be provided at the cheapest rate without the dangers arising from periodical crises. As soon as a particular industry begins to pay, the promoters of that industry may be called upon to issue shares to the extent of the loans which they received from the industrial bank and sell to the Indian public mainly. The amount so realised may be utilised by the Government either in discharge of the public debt or in fostering new industries.

We must be very particular to see that such a system does not eventually become reduced to the system of investment of foreign capital in India.

The third method is to raise capital for the industrial bank, partly by issue of shares and partly by raising a public loan like the Industrial Bank of Japan.

The success of this bank will entirely depend upon the agency employed to conduct the business of the bank. The directors of these banks must be men of business experience and nobody else. The banks should be equipped with an up-to-date information department and a highly technical staff who can critically examine the industrial possibilities of working the concern on sound lines.

Producers' co-operative societies.

Producers' co-operative societies should be encouraged to develop cottage industries in which little capital is needed and where efficiency depends largely on the application and care of the individual workmen, like basket making, shirt making, embroidery, carpentry, manufacturing of cot tapes, durries, napkins, towels, handkerchiefs, carpet and blanket industries, rope manufacturing, etc. This will provide work specially for women who cannot go out of their homes, partly because of the purdah and caste systems which forbid them from entering factory life, and partly because they are the householders and cannot leave their houses. Such societies should not be merely lending societies. Co-operative purchase and co-operative sale of goods should also be the functions of such societies. In fact these societies in the beginning should provide all the requisites for a particular industry. The aim of these societies should be the gradual disappearance of the employer by transferring all the stock of an enterprise to the labourers themselves, and the introduction of new methods to improve the quality and increase the output of the goods, and supply of easy credit. Care should be taken to avoid the tendency to re-establish the very institutions which they seek to eliminate, by refusing to admit new members and engaging hired workmen, thus turning the societies into joint-stock companies.

Here I might mention that the bafta industry at Nathnagar in Bhagalpur District is in need of co-operative producers' societies. The condition of the labourers can be improved by excluding the Mahajan who generally provides them with all the requisites of the industry on condition that the goods so produced will be sold to them oftentimes at lower than market rates. It is a known fact that these Mahajans exploit the labourer's necessity and

his want of forethought, weakness, and ignorance. The industry admits of improvement and is capable of extension by introduction of new methods in the handlooms.

ORAL EVIDENCE, 1ST DECEMBER 1916.

Mr. C. E. Low.—*Q.* How long have you been an employé of the Benares Bank?—*A.* Eight years. Two years I was in Muzaffarpur and six years in Bhagalpur.

Q. What previous training had you in banking before you were employed by the Benares Bank?—*A.* I was doing commercial agent's business in Bombay for about six years, that is, export and import business of my own.

Q. Had you any educational or commercial training?—*A.* I have passed the Public Service examination which we had some ten years ago in Sind. The Government has discontinued that examination.

Q. On what do you advance money in Bhagalpur?—*A.* Bills of exchange, and loans on guilt-edged securities and other marketable securities.

Q. You advance loans on produce?—*A.* We have not got that system. People can get money on personal credit, but they do not keep the produce with us.

Q. Suppose a man has 1,000 maunds of rice which he wants to send to Calcutta, do you finance that?—*A.* They bring the railway receipt to us and we advance money on the security of the railway receipt and forward the receipt to the agency here.

Q. Have you any factory in Bhagalpur?—*A.* No.

Q. No sugar mills, or jute presses?—*A.* Handlooms in tusser.

Q. You obtain your funds mostly from deposits or share capital?—*A.* From deposits.

Q. You do not lend much money on landed property?—*A.* Very seldom. We used to do it, but since the 1913 crisis we have stopped.

Q. But you can advance up to the extent of your share capital?—*A.* That depends upon circumstances and time.

Q. Hon'ble Sir F. H. Stewart.—I do not understand your proposal of financing industries. Do you mean that Government should start an industrial bank?—*A.* Yes. It should be like the joint stock companies and shares should be issued.

Q. It is to be a private enterprise without Government aid?—*A.* No.

Q. You say a second method is to provide capital by raising public loans on lines similar to those on which other public loans are raised by the Government. You say that the Government should say that they are going to finance such and such an industry and raise the loan for that specific purpose?—*A.* If we are not able to get shares taken up in the market, in that case Government should raise a public loan.

Q. Hon'ble Sir Fazulbhoj Currimbhoy.—Who are the promoters of your Bank?—*A.* The Benares people.

Q. And you are the agent there?—*A.* Yes.

Q. Do you get remuneration or agency commission?—*A.* Remuneration.

Q. And your experience in banking has been only for eight years?—*A.* Yes, in this bank.

Q. Before that you had no banking experience?—*A.* No.

Q. And it is only like a shroff's business, lending money on properties?—*A.* There is actual banking to help business.

Q. Industries?—*A.* Up till now we have not been able to do help to industries, because there has been no call on us for there are no industries in Bhagalpur. We only lend to merchants.

Q. You take hundis?—*A.* Yes.

Q. Do you think that people will subscribe to an industrial bank? What is your experience as banking agent?—*A.* If we get good experts and people are made to understand the object of it I am sure.

Q. Experts in what?—*A.* In banking business.

Q. And they must come to the industries without knowing whether the industries are good or bad and without having any knowledge of technical or other things?—*A.* We have got in Karachi the Hon'ble Mr. Webb who has started a railway. The people were quite ignorant of the line of business he was going to start, but because the people had confidence in the person they subscribed capital.

Hon'ble Sir R. N. Mookerjee.—*Q.* You say, "I am not in favour of guaranteed dividends for a limited period. The same evils which appeared in the guaranteed railway system may be expected to re-appear." What are the evils of guaranteed railway system?—*A.* It is only a known fact that we have no guaranteed railways who pay dividends as much as other railways pay.

Q. That is your experience?—*A.* I have heard. I do not know of any guaranteed railway paying 7½ per cent. as many private concerns do.

Q. The guaranteed railway pays 8 per cent.?—*A.* Of what standing? The more time a concern takes the better the result.

Dr. F. Hopkinson.—*Q.* You say, "A better method of financing industries is to start new industrial banks on the lines on which similar banks exist in Japan and Germany." Can you tell us very briefly what those lines are in Germany?—*A.* The major portion of the share capital is subscribed by Government.

Q. You know that?—*A.* I have read it. One does not expect to go and inquire about these things there.

WITNESS No. 97.

Mr. A. M. Arathoon.

MR. A. M. ARATHOON, *Shellac Manufacturer, Jhalda, Manbhum District.*

WRITTEN EVIDENCE.

Lac industry.

My experience of Indian industries is confined to the lac industry and my experience or opinion may be useful in this connection only.

The lac industry generally, from the cultivation of lac trees to the manufacture of shellac, is carried on by primitive methods and Government could greatly help the industry if the industry is investigated with a view to the increase and improvement of the cultivation and propagation of lac insects and the collection of lac incrustation on scientific lines. The methods now used are extremely careless and imperfect and often wasteful and a special study should be made with a view to the improvement of the method as with the present method there is considerable wastage of material and labour.

It would further be for the interest of this country generally and of the lac industry particularly if the export of the crude or unmanufactured lac to foreign countries in the form of raw or seed lac were prohibited or restricted.

The only financial help which Government could give the industry with advantage is to aid cultivators of lac in times of distress or when there is locally scarcity of lac insects for inoculation of trees to obtain lac insects from elsewhere by advancing them small loans on nominal interest.

The lac industry could greatly be improved if the researches were made by Government and scientific aid provided, *e.g.*, a good deal of useless labour and wastings could be avoided by the introduction of scientific methods for crushing, washing, extracting more shellac from the raw stuff than is done at present and this can only be effected by expert scientific methods; in my opinion the lac industry is the only important industry which is least studied. There is room for considerable improvement both in quantity and quality and the doing away of the present laborious methods.

The lac dye industry should be revived and this could easily be done by using certain chemical process and foreign dyes could easily be ousted from the market. More facilities should be given for the transit of shellac on Indian railways; the present slow transit is often the cause of deterioration of shellac, specially in the hot weather.

ORAL EVIDENCE, 1ST DECEMBER 1916.

President.—*Q.* You have been engaged in the shellac manufacture for a long time?—*A.* Yes, I have been about 23 years in shellac.

Q. Have you had any previous technical training for that work?—*A.* No, just a practical knowledge.

Q. You say that "The lac industry generally, from the cultivation of lac trees to the manufacture of shellac, is carried on by primitive methods and Government could greatly help the industry if the industry is investigated with a view to the increase and improvement of the cultivation and propagation of lac insects, and the collection of lac incrustation on scientific lines." Have you read the report written by Mr. Misra of the Agricultural Research Institute at Pusa?—*A.* No, I have read Watt's book.

Q. This is very ancient. The last report by Mr. Misra was in 1913, since supplemented by another note. Why have you not got into touch with people who are actually doing this work?—*A.* I have not had occasion. I did write to Pusa for some information, but it was not very much.

Q. You have not seen bulletin 23?—*A.* No, I have not.

Q. Surely if you keep up-to-date with your work you must recognise the existence of literature of this sort. You have advocated what is already being done by Government. You did not ask them at Pusa if they had published anything on the subject?—*A.* No, I did not.

Q. Write for bulletin 23 and get into touch with Mr. C. S. Misra, and you will find him very willing to help you?—*A.* Thank you.

Mr. C. E. Low.—*Q.* Have you had any idea of growing lac? You wanted to grow lac on some trees you had. What kind of trees?—*A.* All sorts, Kurum and Palas. These were trees I grew myself in my own compound.

Q. A miscellaneous lot of trees growing in your own compound on which you proposed to grow lac, as an experimental or commercial proposition?—A. It was experimental, but it would be commercial if successful.

Q. You can take it from me that it is not a commercial proposition to grow lac on a small number of different varieties of trees; it would be better to keep to one kind of tree and grow one kind of lac?—A. It grows in the same way on all trees. Palas and Kusum are different. There are two kinds of lac.

Q. Merely for growing lac I would suggest that you might have got hold of an ordinary cooly from the lac district, who would have shown you how to do it at once, and after doing that you might have found the information which Pusa could have given you much more valuable than if you had had no practical experience at all. You purchase lac from up-country merchants?—A. Yes.

Q. From what parts of India?—A. In the district.

Q. What process do you manufacture lac by? Do you use alcohol?—A. I don't.

Q. You mean you heat the lac and squeeze it out?—A. Yes.

Q. Then you sell to Calcutta?—A. Yes, the whole thing is sold to shippers.

WITNESS No. 98.

MR. J. M. CASEY, *Planter and Managing Proprietor, Nildongri Sisal Hemp Estate, Sambalpur.*

Mr. J. M. Casey.

WRITTEN EVIDENCE.

Notes with regard to sisal hemp industry in Bihar and Orissa.

The sisal hemp industry is an old established one in Yucatan, Mexico. Attempts have been made to grow it successfully in India, principally in Assam, but with little result for numerous reasons, chiefly climatic.

This estate was started by me in 1904, with plants procured from Sylhet. The first few Nildongri sisal years, progress was very slow indeed, owing, firstly, to the want of experience; secondly, to the plants not being acclimatized to this part of the country (the death-rate being as much as 40 per cent. during the first few years), and lastly, to the lack of funds.

But, as my experience of the plant, and its treatment increased, and I started planting on a larger scale, and with my own acclimatized suckers, the result has been vastly different.

I have now 545 acres under sisal, much of which, though, is not yet in bearing. My crop for the past season, 1915-1916, amounted to 1,000 maunds, and was sold locally at fair prices.

At the beginning of last season, a sample of hemp from this estate was sent to Messrs. Ide & Christie of London for report and valuation. They classed it as first class sisal, commenting favourably on its colour, strength and preparation, and valuing it at £39-40 per ton, which was the rate prevailing at the time for first class sisal hemp.

From the hemp statistics up to 1914, the latest in my possession, the world's shipments of sisal hemp rose from 611,939 bales in 1903 to 982,000 bales in 1914. German East Africa alone shows a rise from 4,828 tons in 1909 to 19,814 tons in 1913.

I am of opinion that this industry could be greatly extended in these parts, as my experience of the past twelve years has proved that the climate, soil, and the lie of the land generally, are all favourable to the cultivation of sisal.

Q. 41.—The land tenure in this district is not encouraging enough to entice capitalists and others to invest their moneys in industrial undertakings; for according to the regulations of this district, owners of village lands have not the right to dispose of such, and it is risky negotiating for even a lease of such lands, as it is most difficult to find out what actual rights the owners hold. There is not much land held directly by Government, and the bulk of it is under Government Forest, and from my experience Government land is not easy to obtain. Land policy.

Q. 42.—I would suggest that Government should give concessions of land on the following terms to encourage the establishment of new industries, which have in them a likelihood of success:—

(1) A lease of not less than 80 years, with the option of a renewal of the lease.

(2) That the land be leased free of rent for the first four years. Rent thereafter to be charged at the rate paid for land of similar quality in adjoining villages.

(3) Should the land thus conceded contain forest of any value, such forest be disposed of to the lessee at a nominal valuation.

(4) That the lessee be given the right of transfer of his rights and interests in the property.

(5) In the case of land taken up for cultivation of Sisal from zemindaries and villages, Government should acknowledge and guarantee the lessee's rights in such lands. Government assistance.

- Q. 5.—I consider it would encourage and considerably help new industries, such as the one in question, if Government were to supply machinery and plant on the hire-purchase system, as the machinery and plant required for a sisal hemp plantation are expensive items.
- It would certainly be very helpful if Government would guarantee the purchase of crops on a fair valuation, until such industries were well established.
- Roads. Q. 97.—With regard to transport facilities in this district, the roads are few, and most of these are but village tracts. I would recommend that the existing roads be put into proper repair and that new roads be opened to facilitate industrial development, and in the opening out of the country generally.
- Railway freights. Q. 98.—In reference to railway freights, my experience is that railways are not too much inclined to foster new industries by grants of special concessions, and I would suggest that railway companies be induced to grant special rates for the carriage of produce and material of new industries, as is generally done in other countries.
- Jail competition. Q. 109.—There is a lot of inferior fibre, commonly known as aloes fibre, manufactured in Indian jails, from other varieties of the agave, and this is bought up in small lots by petty traders, then bulked and sold under the head of Indian sisal, which naturally does the sisal industry no good, the result being, that the real Indian sisal placed in the home market, is considered inferior to that produced in other countries.
- Official organisation. Q. 60.—I am of opinion that there should be a Director of Industries and that he should be a sound business man.

ORAL EVIDENCE. 1ST DECEMBER 1916.

Mr. C. E. Low.—Q. How did you get possession of this area in the Sambalpur District?
—A. Through Government, from the Forest Department. It was originally forest reserve. I got it on a 30 years' lease.

Q. On what terms?—A. The ordinary terms payable for village lands in the adjoining villages.

Q. Did you get it rent-free for any period?—A. For four years.

Q. What decorticating plant do you use?—A. American. This has a capacity of 3,500 leaves per hour.

Q. What power do you use?—A. 12 H. P.

Q. What percentage do your leaves give?—A. At the present moment it is not a very fair test, because we are really dealing with a good bulk of leaves not fully grown. Last season we got 30 lbs. of fibre per thousand leaves, that is with the ordinary leaf we manufacture every day; for picked leaves, 56 lbs. per thousand leaves.

Q. Have your plants come into full bearing as yet?—A. Some of the earlier areas are all in bearing, but the area being small the outturn is small as compared to what it should be.

Q. Is your full area under sisal at present?—A. No, I have still got about 150 acres to plant.

Q. Did you have any difficulty with working the decorticator at first?—A. No, I started off first with two raspadors of the kind which they use in Yucatan, and last season I got in an American machine which is automatic.

Q. You don't have to handle the leaves?—A. You just slip the leaves in, these are gripped between two chains and carried forward, and the fibre is delivered on an endless chain.

Q. What is the name of it?—A. By the Prieto Machine Co. They are the largest manufacturers for Yucatan.

Q. You never tried any of the German machine? By Krupp of Magdeburg?—A. I have not tried it but know something about it, styled the New Corona.

Q. Did you see them in the Allahabad Exhibition?—A. No, there were two in Sylhet.

Q. Can you see your way now to satisfactory profit out of your area?—A. Yes.

Q. You state, "it is most difficult to find out what actual rights the owners hold." Why do you say that?—A. Our district is a peculiar district. It belongs to Bihar and Orissa and yet is not worked in the same way as other districts of Bihar and Orissa. It was taken over from the Central Provinces, and the rules and regulations in the district are those that are now used in the Central Provinces.

Q. Are you not aware that village patwaris maintain a record-of-rights, which is kept up-to-date, or use to be in the Central Provinces?—A. No.

Q. You have never inspected the village papers?—A. No, I have not seen any village papers.

Q. Perhaps you are speaking without the book?—A. I have tried for village land, and have been advised not to touch it by legal people.

Q. That is because of the difficulty of acquiring the right, not the difficulty of ascertaining the right?—A. I don't know what it is, but there are so many shareholders.

Q. The proprietary right can always be ascertained on application to the officer of the tahsil, and any charges on this can always be ascertained on application to the Registration Office. Tenancy rights can be seen by inspection of the village papers?—A. Then again the

objection to village land is that it is generally all rice land, and rice land is not suitable for our cultivation. We want high land. I have some photos here. It is more *dongri* land that we want.

Q. Did you find any difficulty in marketing your fibre?—A. Not at home; but out here they don't seem to quite understand it.

Q. You did not think of communicating either with the Commercial Branch of the Board of Trade in England, or the Director of Commercial Intelligence here?—A. No.

Q. You did not try to get some firm at home to authorize some firm of shippers to deal with you?—A. The firm here sent to their recognised brokers at home.

Q. Did you discover whether there was any high proportion of lime in the soil?—A. I have not had it analysed, but I should say there was a very great proportion of lime.

Q. You speak of the terms on which you think Government should give land concessions for new industries. Your fourth suggestion is that "the lessee be given the right of transfer of his rights and interests in the property." You don't speak about any of the obligations which should attach to it. A man could get his land, according to your proposal for 4 years, and then sell it without doing anything on it, except grazing cows on it, for instance?—A. Government would put their own stipulations in such a case, and thus protect themselves.

Q. Did you require any outside help in the matter of financing and starting this industry?—A. Yes, latterly.

Q. Did you find difficulty in getting it?—A. Yes.

Q. Did you try any bank?—A. No, I never tried banks.

Q. There is no local bank at Sambalpur?—A. There are a few local Marwaris.

Q. I mean ordinary banks?—A. No, I don't think they do that business.

Q. You speak of this fibre being extracted in Indian jails? Is any of that exported?—A. It goes down to Bombay and is sold as Bombay aloe fibre. I heard it was also sold in Calcutta as Indian sisal.

Hon'ble Pandit M. M. Malaviya.—Q. What is the difficulty in obtaining land; is it that other crops are more useful?—A. They don't seem to be willing to part with their land. I cannot arrive at a proper reason.

Q. But they are cultivating the lands?—A. No, there are many villages with more land out of cultivation than under cultivation.

Q. Is there a large area of waste land?—A. Yes, but that sort of waste land would not be suitable for our cultivation.

Q. Then land suitable for your cultivation is not lying fallow?—A. The bulk of suitable land is under Government forest.

Q. Apart from Government forest, there is no other land suitable for your cultivation which is lying fallow?—A. There may be in zamindaries and other parts of the district which I have not visited.

Q. So far as you are aware, there is not much land lying fallow suitable for your purpose?—A. No. Another thing is, out of much of that suitable land, Government has, within the last three or four years, reserved some thirty thousand acres and put it into the forest.

Q. That is perhaps because the Government consider that it would be more valuable than leasing it to you?—A. I never asked for it. I say, in the case of extending the industry, those would be suitable places of course.

Q. Then your suggestion comes to this, that instead of putting in so much land under reserved forest, the Government should lease out some portions?—A. Yes, to form a nucleus.

Q. Would that not be determined by the consideration whether it would be more profitable for Government to reserve it for forest than to lease it to you?—A. From a commercial point of view I don't think the Sambalpur forests are very valuable; the timber raised on these forests is not very valuable.

Mr. C. E. Low.—Q. Would it be more correct to say that on the land you want, there is scrub jungle, etc., of no value?—A. We don't want level land; it is rocky hills that we look out for most; well-drained soil.

Hon'ble Sir F. H. Stewart.—Q. Would most of your hemp be for export?—A. Yes, the bulk of it.

Q. And your principal competitors would have been German East Africa and Mexico?—A. Yes, but the bulk of the outturn of Yucatan remains in New York and does not leave America.

Q. Then you think that you could compete fairly satisfactorily?—A. Very satisfactorily, because our other conditions are favourable; for instance, labour and other conditions.

Q. You have had no experience of trying to grow sisal hemp in other parts of India?—A. No, but I have been to Sylhet and seen the plantations up there.

Q. They are not successful?—A. No, they get all sorts of blight, and are not satisfactory. I think there is too much moisture there. It is a plant that requires a dry, arid country.

Q. This inferior fibre, is that grown now to the detriment of your better article?—A. I could not say that.

Q. There are people at home who know all about this fibre, and are accustomed to dealing with it?—A. Yes, in London.

Q. Calcutta would be the normal port for you to ship through?—A. Yes, we are about 300 miles from Calcutta.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. What climatic conditions are needed for this industry?—A. A very dry, arid climate.

Mr. C. E. Low.—Q. Not in the rains?—A. We had 62 or 64 inches this year, but so long as you have it on these dungries and steep lands it is safe, as you have well-drained soil.—A. The conditions in Yucatan are much akin to what we have in the Central Provinces.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Do you think this is the only part of India where it can be grown?—A. No, I would not say it is the only part, but the Central Provinces generally is suitable.

Sir D. J. Tata.—Q. Where did you first gain your knowledge or experience of this industry?—A. Mostly from books. I had a little experience in Sylhet for a fortnight, and talked with people who had been in this industry, but it was mostly practical experience which I had developed myself.

Q. What induced you to go in for this particular business?—A. I had been reading about this industry for two or three years.

Q. You have no knowledge of Yucatan, except from books?—A. No, but it struck me that this particular district corresponded to the Yucatan conditions.

Q. With regard to fibre, you acquired all your knowledge from books?—A. Yes, and practical knowledge.

Q. Have you made a thorough study of the question and read up everything possible on the subject?—A. Yes, I have been at it for 12 years.

Q. Is there any literature extant?—A. There is the Kew bulletin which gives lots of information about it, and there are pamphlets issued by the Manila Government. They grow it in Hawaii.

Q. That is with regard to cultivation, but with regard to the manipulation of the fibre?—A. It is in the same work; the Kew bulletin gives a lot of information about it.

Q. You have had no opportunity of consulting an expert on the subject?—A. No, there is none in India.

Q. But out of India?—A. I was thinking of visiting other plantations out of India, and comparing notes with the plantations there.

Q. With reference to machinery, you selected this particular one because it was well spoken of; you did not try to see other machinery?—A. I had seen Todds, and two or three other machines working, but found there were little hitches here and there. I thought I would like this one, especially as I had a small engine and boiler. The conditions more or less suited me with this machine, as my area was small.

Q. My object in asking you was to know whether you had made a particular study of the machine?—A. No, but I had been studying this question for 12 years.

Mr. C. E. Low.—Q. Had you any experience as a mechanical engineer?—A. I served my time as a civil engineer.

Mr. A. Chatterton.—Q. Can you tell us how much per acre it would cost to bring a Sisal hemp plantation into bearing; what would be the amount of capital required?—A. Including machinery and everything, Rs. 225 per acre.

Q. In how many years would your plants begin to yield?—A. They generally yield in 4 years. My unacclimatised plants did not, but with my acclimatised plants I did it in four years.

Q. After the plant has grown up, and you begin cutting the leaves, as far as your experience goes, have you had any difficulty with premature poling?—A. No, we have got plants that are down 15 years, but they were big plants 3 or 4 years old when put down which I got from the Botanical Garden, Sibpur. They have not poled yet.

Q. Have you been cutting the leaves?—A. Yes, regularly.

Q. Have you found that cutting the leaves tends to induce premature poling?—A. I cannot say; my experience is not long enough.

Q. Of the earlier plants which you have now been cutting, what percentage have poled?—A. I have planted out seven lakhs of plants at different periods within the 12 years, and this year the number of poles is 1,850 out of seven lacs.

Q. You say you got about 30 lbs. of fibre?—A. Yes, from leaves big and small combined, but if I select the leaves I get 56 lbs. to the thousand leaves.

Q. Have you any special arrangement for transporting leaves?—A. By carts.

Q. How far apart do you plant them?—A. I started with 40 by 5; now I have narrowed it to 8 by 4. I get about 1,400 plants to the acre.

Q. Do the plants in Sambalpur stool freely?—A. Yes, after the second or third year. Besides planting out this area (I originally started the plantation with 55,000 plants), I have disposed of about 8 lakhs outside and planted out 7 lakhs of my own from these 55,000 in 12 years, all from suckers. I have a few bulbils, but I cut the poles out as soon as they appear, so as to get a full crop of leaves for that year.

Q. How many leaves did you calculate to get from each plant?—A. About 30 leaves per plant per year. We ought to go on for about six to eight years.

Q. What arrangements do you make for replacing the old plants?—A. Interlining 5 years after the original ones have been put out. In the centre of the 8 feet space I run in another time.

Q. What do you do with all the pulp from the machine?—A. I use it as manure and return it to the soil where the soil has a tendency to be poor.

Q. You have no experience of working with Todd's machine?—A. No, but a good machine is the one made by Robey of Lincoln, which is supposed to be the machine.

Q. What do you consider is the minimum area, or the most suitable area for this industry?—A. 500 acres.

Q. How much of that would you plant out?—A. The whole area; then you would want a few hundred acres for fuel, and for your labour force, etc.

Q. And for extracting the fibre do you want a large quantity of water?—A. Not very large; I turn out about ten maunds of fibre per day, and I don't think I use more than about 8,000 gallons of water which is supplied by a tank.

Q. You suggest in your note that it "would certainly be very helpful if Government would guarantee the purchase of crops on a fair valuation, until such industries were well established." Do you have any difficulty in selling your crop?—A. I had at the start, but not now, as prices have gone up and there is a good demand for it.

Q. I presume your difficulties were due to the small quantities you were offering. Do you sell through brokers?—A. I sell through agents in Calcutta.

Q. Is it a fact that you can send your crop to London brokers, and they would sell the whole lot for you?—A. You would have to employ somebody in Calcutta to do your business for you, and you would practically require agents there.

I suppose you would now withdraw that statement, do you think Government should guarantee the purchase or guarantee that they should be sold? There is a lot of this fibre used in Government works, and it might be helpful if Government consumed it in the country.

Q. To what purpose?—A. For shipping generally.

Q. Do you know of any other use it is put to, except making ropes?—A. A lot is made into nets for trawlers, both in Japan and in England, as it makes very good nets, and they are now, I believe, putting it to many of the uses to which they formerly put flax. As the North of France and Belgium, and parts of Russia have gone out of cultivation, they are substituting this for flax for many of the coarser works. It is used largely in self-binder harvesting machines in Canada, Australia and also in brush manufacture.

Q. Are you getting a better price now for your fibre than before the war began?—A. About double the price. I sell in Calcutta outright, because it is difficult to get freight, and you don't know when you may get it.

Q. What is the quality of the land on which you grow this fibre?—A. Poor land; what would be useless for any other crop, on which they generally grow their *til*. It is even too poor for *til*.

Q. Is your plantation at all patchy?—A. No, it is in one block.

Q. In one part of it does the plant grow two or three times the rate of others?—A. The unacclimatised plants, not the acclimatised ones.

Q. You do not know if lime is an important factor?—A. They say it is necessary to have lime.

Q. Are you supplying these stools or suckers to other plantations?—A. Yes, I supplied a lot to a Native State south of me, but I have not heard what they are doing.

Mr. C. E. Low.—Q. Do you bale?—A. Kutchia bales in 2 maund sizes.

Hon'ble Sir F. H. Stewart.—Had you previous planting experience before you took this fibre?—A. I had been in tea; not working in tea, but I used to live on a tea garden and know a little about tea.

Mr. A. Chatterton.—Q. Would it be possible to have a portable plant so that you can go round and deal with small plantations of 4 or 5 acres. Could you cut your leaves at any time?—A. Only from October to the end of May would be suitable.

Q. You would get a season of 7 months in which to cut leaves?—A. 7 to 8 months.

Q. Would there be any difficulty from the planters' point of view in cutting all the leaves at one time?—A. It would not be good for the plant. It would retard the growth. I work it in cycles and it probably takes me a month to come back to the original place where I started.

Q. Supposing you take a well developed plant and cut off one-third of the leaves in each year, do you think that would have any serious effect on the growth?—A. Yes. It is said to throw it back. In the following year the plant would not have such a good growth. The less shock given to the plant at one time the better

WRITTEN EVIDENCE.

Manufacture of paper.—The Bengal Paper Mill Co., Ltd., was registered in 1889. Its mill is situated at Raniganj, where Rs. 21,60,000 has been expended on buildings and machinery.

The present output of paper is some 6,600 tons per annum, and although the mill compares in equipment favourably with the ordinary standard of mills in the United Kingdom, the history of the mill for the past several years has revealed a long struggle to pay a moderate dividend on a reduced capital.

The fact that imports of paper amounted to £1,058,454 in 1913, indicates the possibilities for paper mills, but owing to the low prices at which continental papers are placed on the Indian market, the demand for papers made from such materials as are at present in common use, is very restricted, and short of a protective tariff, the two questions in the Commission Schedule which it seems to us chiefly concern the local paper industry, are (7) of question 5 and question 98.

Railway freights.

Dealing with the latter question, railway freights are high in consideration of the value of the products required for paper-making. For instance, the freight on a maund of paper from Hamburg to Raniganj is Re. 0-14-3 while freight on grass from the Nepal fields sufficient to make a maund of paper is Re. 1-5-0 and the collection of waste material in Delhi and Lahore, such as waste paper and rags, incurs freight at the rate of Re. 0-15-9 and Re. 1-2-3 per maund of material respectively. In short, the rate of freight from Hamburg to Raniganj, if applied to the raw material used at Raniganj, would only allow grass to be brought from Chota Nagpur and Sahibgunge districts, but it would not allow waste paper and rags to be brought from any important up-country centre, and would only permit of jute, hemp, etc., being brought from Benares and nearer districts.

Similar difficulties apply to the marketing of the paper itself, as the following characteristic rates of freight indicate:—

		Rs.	As.
From London to Bombay, Madras or Calcutta	20	4 per ton.
From Raniganj to Madras :	{ Rail	25	5 "
	{ Sea	28	12 "
From Raniganj to Bombay :	{ Rail	42	5 "
	{ Sea	30	12 "

It is freight on raw material, however, which is the chief difficulty in the way of local paper competing with the imported article, and which also stands in the way of developing other sources of paper-making material in other parts of the country.

The other question which we refer to as having a considerable bearing on the prosperity of the paper industry is the guaranteed Government purchase of products. The local mills have enjoyed Government support for some considerable time, and it has been so vital to their existence that the risk of losing it has been a check on the production of paper locally. The

guarantee of Government to purchase their paper requirements in India would be an-incentive to increase the production, and this, together with special freights on raw material, would be of much value.

Such support, however, would be likely partially to fail in its object, unless something can be done to protect the industry by a tariff against foreign imports of subsidised or dumped supplies, which in some cases have been brought to Calcutta from Sweden at a freight of 3 annas 4 pies per maund; and if the paper industry of India is to grow, we feel strongly that this step will prove necessary. To exemplify its worthiness for protection, the following figures are submitted referring to the 3-machine mill at Raniganj turning out some 6,600 tons of paper per annum :—

	Rs.
Royalties paid on grass	39,000 per annum.
Native wages at Raniganj	1,95,000 „
Native wages in the grassfields	1,50,000 „
Native wages in collection of waste material	50,000 „
Railway freight on raw and finished products	2,25,000 „
Duty on imports	25,000 „
Rosin purchased from Government factory	38,000 „
Coal consumption	45,000 tons.
Labour force employed at mill	1,200 hands.

In addition to the above direction in which the manufacture of paper directly contributes to the prosperity of the country, as opposed to imported supplies, it will be remembered that the industry also has a direct interest in the development of local supplies of caustic bleach china clay, dyes, etc.

To summarise, we submit that while the guaranteed support of Government and reduced railway freights would tend to increase the manufacture of paper, a protective tariff is likely to prove necessary, if the industry is to increase.

(Witness also gave confidential oral evidence.)

WITNESS NO. 102.

HON'BLE BABU BHUPENDRA NATH BASU, *Attorney at Law, Calcutta.*

*Hon. Babu
B. N. Basu.*

WRITTEN EVIDENCE.

Financial aid to industrial enterprises.

I have had some experience in raising capital for industrial enterprises. I was instrumental in raising capital for some important indigenous concerns, such as, the Indian Stores, Limited, the Bengal Luxmi Cotton Mills, Limited, the Bengal Hosiery, Limited, the Bengal National Bank, Limited. Capital.

I experienced great difficulty in raising the capital for these concerns : much of it was subscribed through the personal influence of myself and others who took an interest in the concerns. The reason for this difficulty is obvious. The people who have as a rule largely subscribed towards these swadeshi concerns mostly belong to the poorer middle classes of Bengal. Their savings are small and they naturally are unwilling to put these savings into enterprises, which cover new area in the industrial field and the chances of the success of which they are unable to judge by anything they have learnt through education or environment. Among the middle classes, the first concern to a man who begins to earn is to provide a home for his wife and children and if possible, some means of a secure income for them which may be beyond the vicissitudes of industrial or commercial ventures. Government securities, guaranteed or safe railway companies and most important of all landed property, attract the largest part of the savings of the comparatively poor middle classes. Perhaps a fraction of them, the more adventurous, invest in bank shares and shares of joint stock companies of long standing. Coming to the wealthier middle classes, among whom I include the more fortunate section of the professional classes and the more successful businessmen, the investments I have just mentioned appeal to them in a larger degree, specially landed property, which is the safest investment and at the same time gives to the holder a considerable degree of prestige and dignity. They are not attracted by industrial concerns involving a certain amount of risk to their capital so long as there are in Bengal, large landed properties with revenue permanently fixed, available through the necessity or extravagance of their proprietors, as fairly profitable investments either for the purposes of loan or purchase. On the other hand the arid sands of Rajputana offer no inducement to capital and the Marwarce has become a trader by necessity. Coming to the mahajans or professional money lenders they prefer to lend money at high and exorbitant rates of interest on land or produce, which is often placed under their control, rather than risk their capital on industrial concerns with doubtful returns and with a

certain amount of danger to the capital invested. The agriculturist is too much engrossed in his own hard occupation to look beyond the boundaries of his own small holdings.

The middle class young men of Bengal have been impelled by a certain amount of economic necessity to look out for new fields for earning livelihood, but the principal motive for embarking upon industrial ventures during the years following the swadeshi movement was more or less patriotic and sentimental. Sentiment alone cannot lead to industrial success unless it is accompanied by solid knowledge and experience. During the height of the swadeshi movement in Bengal, as regards the various factors of production, it might be emphatically mentioned that there was no lack of capital forthcoming. There was not indeed a sufficient number of people with technical training who could ensure the production of an article with the necessary finish and quality. Even that would not be very difficult to find either in the province or outside. The real stumbling block so far Bengal is concerned arose from the absence of trained business men, men with general common sense, capable of judging industrial possibilities and of adapting the enterprises in their charge to the actual local conditions. Elasticity with regard to our enterprises could only come from men who had been in actual touch with commercial life and had the necessary knowledge and training. The organisation of joint stock enterprise—a new form in this country—requires men who can master on one hand details of work and procedure and who will also understand the responsibility of their work to the public and the shareholders. A good many blunders could have been avoided. Several enterprises which have gone into liquidation or are still languishing with feeble life would have proved eminently successful, if we had a larger number of men with the knowledge of the material facts of commercial enterprise and with the power of forming sound business judgments. To a very large extent our present educational system is responsible for this state of affairs.

A very serious difficulty has been created by the fact that the existing system of education, while it has greatly liberalized and stimulated the mind of the country, is far removed from the actual facts of life which young men have to face when they are called upon to do practical work, and the result is generally disappointing. The ideas of ancient scholasticism are more or less the ideals of present day English educationists and they still dominate the systems prevailing in Oxford and Cambridge; and these have been transplanted in India where owing to the speculative genius of the people, it has found a congenial soil. Where practical men are wanted we have been given a race of Pandits, with this difference, that instead of having learnt the ancient literature of their own country, which might be of some use, they have learnt with considerable assiduity numerous facts like the conjugation and declension of Anglo-Saxon verbs before the days of the Norman conquest. It may have its uses but from the standpoint which we are considering at the moment it has not proved very helpful.

Besides the difficulty of capital and the paucity of men with technical and business knowledge there are peculiar difficulties in Bengal with regard to labour. The Bengal peasantry are comparatively prosperous on account of the fertility of the soil, an abundance of rainfall, fixity of tenures and fixity of rent. Bengal labour has to be paid higher than labour from any other parts of the country and even the allurements of higher wages does not always bring the necessary number of Bengali labourers. The Bengali is an extremely intelligent workman, but it is difficult to get him for factory work. He has got his own caste and guild systems and he gets in his own occupation sufficient work for his immediate needs. The attachment of the Bengali rural population to their ancient land which has given them sustenance for many generations is equalled by their aversion to crowded life in unhealthy cities. Real prosperity for industry in Bengal can only come, amongst other things, with the growth of a substantial labouring population. The means of achieving this so far as the various functions of the State are concerned are indicated further on.

As land is the best and safest form of investment it ought to attract a large amount of capital for investment but it is the pitting of the intelligent and keen money lender against the needy but ignorant cultivator and there being no usury laws or any other check on money lenders, the rates charged are very high, some times ruinously extortionate.

Function of the
State.

These difficulties have never been seriously grappled with by the State. The genius of the British people have been individualistic and their prosperity has depended largely on the policy of *laissez faire*. The Englishman thinks only when the actual difficulty has arisen. These let-alone ideas have also dominated the acknowledged policy of the Government of India. No satisfactory reasons have so far been put forward to indicate why the State in India should not do something on the lines of what has been done in other similarly situated countries. To take a single appropriate example, the case of Hungary throws a good deal of useful light on some healthy forms of State assistance for the promotion of industry. The agricultural population of India is about 75 per cent. In Hungary in the year 1900 the agricultural population was 76·83 per cent. and the industrial only 5·26 per cent. Among the labouring classes, the percentage of agricultural labourers was 78·46. Of the imports 75 per cent. consisted of manufactured goods and of the exports 85 per cent. represented agrarian produce. Hungary had to compete with Austria, against which there was no protective tariff and she suffered from an absolute lack of skilled workmen. Legislation was first undertaken in 1881 for State aid and a fairly comprehensive law was enacted in 1890. In 9 years ending with December 1898, 1,609 new establishments were started with a total capital of 206,706,814 crowns. Apart from the laws giving

facilities to the growth of industries the direct encouragement given to new industries in the year 1899 was as follows :—

- 28,096 crowns for value of machinery.
- 43,600 crowns for education of apprentices in different trades.
- 10,600 crowns for purchase of raw material.
- 12,200 crowns for shoe makers, tailors, potters.
- 22,400 crowns for institutions for display of new tools and machines.
- 1,250,000 crowns for commercial schools.

What has been successfully achieved in Hungary may also be done in India and this brings us to the part the Government ought to take in the development of new industries in India, a subject dealt with by question no. 5.

The first requisite is information : when people desire to start a new industry they do not know where to go to for the necessary information. In my experience, the first promoters of a match factory in Calcutta brought out their machinery from England which proved valueless as match-making on a large scale had greatly decreased in England ; they had to indent fresh machinery from Sweden and that exhausted their capital and the enterprise came to an end. The first promoters of a hosiery factory in Calcutta imported their machinery from England ; the machinery is still lying useless : its manipulation was difficult and its produce unsuited to the Calcutta market. There must be a bureau of industrial information and industrial statistics under a Director of Commerce and Industry in each province ; bulletins must be published written by sound men who have studied their subjects in their actual application in other countries and these bulletins should be periodically and freely circulated through existing libraries, District Boards and Municipalities. The bulletins must be of practical value like the bulletins issued by the American Government. Consular reports of foreign industries submitted to Parliament should be published in India and freely distributed. There is a vast field in which the activities of the Department of Commerce and Industry can expand with advantage in the matter of making suitable information readily available. And from this point of view, it is necessary to let the people know about the services the departments like that of Agriculture and Commerce and Industry are willing and able to render.

Bureau of Commerce
and Industry.

While there is such a thing as protection for a special industry by direct subvention or indirect help, there are certain measures which tend to help all industries in common. Such is the one regarding information outlined above. Such is also the founding of industrial schools for an intermediate order of men—the overseers and departmental managers. Real technological institutes in this country do not exist and the present engineering colleges touch only a fringe of the large work which still remains to be done. The same may be said regarding commercial schools and colleges. That is one of the means of increasing men who understand in all its aspects the organisation of joint stock enterprise and who have got some knowledge regarding the relation of the industrialist to his banker, to the carrier, to the broker and all the other people engaged in occupation subsidiary to trade and industry. It may be argued that technical and commercial education are mere catchwords and that these schools will not produce either industrialists or businessmen. But we have the model of successful countries before us in this matter and it must be said that there will be no industries till greater effort and expenditure are directed to these ends. If we admit for the sake of argument the fear that the product of these institutions will run to waste for want of occupation, it is still not so bad as it looks, because after all there is considerable waste at the present moment in the youth of this country. How many thousands of our literary products are thrown into the waste paper basket of life because there is no need for them, and then emptied in tattered fragments into the highways of the world ? They are put away somewhere and of some, nothing more is heard, except at times of a suicide in some penal settlement or of madness in some distant jail. It could not be worse, it may be confidently expected that with larger activity of the State in technical and commercial education the result will certainly be better.

Industrial schools.

If industrial schools are started with a definite objective and fit in with industries in existence or industries which may with advantage be introduced and developed in the locality, they would serve a very useful purpose. These must be located in or near industrial centres and the teaching there should be of practical value by the right kind of men. A single teacher who has been acquainted with the various processes of industry after several years of practical work can do much more valuable work than any number of purely diplomaed people. The recruitment for these teachers should be from all countries possible where the industries in question are prospering. A more useful manner of imparting industrial training would be by free apprenticeship in model pioneer demonstration factories. There will be opportunity of understanding something of the commercial side of the enterprise. There will be opportunity here of turning out trained labour ; and lastly those who are about to venture on similar enterprises could, from the State factory run not on purely commercial lines, always receive useful suggestions and information. In addition to the industrial schools and to a certain extent supplementing their work we must have commercial schools also, not that commerce will make commercial men, just as law schools do not make lawyers, but a knowledge of the general principles of business enterprise, the methods of finance, the organisation of modern commercial and industrial concerns, all these which would be useful in later life could be taught there with

advantage. If the State will help industry, let them give us trained industrialists and young men with some knowledge of the principles of business.

Industrial research.

There is one further matter in which the State can and must assist and that is in the matter of higher industrial research. The results of industrial research are not available in a day and a good deal of outlay is necessary before results could have any practical value. No private agency working on commercial basis could be expected to do this work and the State must do it, in my opinion, in collaboration with the Universities. In the meanwhile, the State can provide consulting laboratories where industrialists can send over materials for analysis and general opinion.

Raising the working man's standard of life.

With regard to labour I have noted some of the difficulties. The part the State can play in bringing into existence a really labouring population is to adopt means to raise the standard of life so that our workmen may appreciate the advantages of better living, of education, and better provision for their children. There should be free schools for workmen's children in industrial centres, and municipal authorities in whose jurisdiction industries are located should supply cheap and sanitary dwellings for the workmen; medical assistance should be available to them on terms within their incomes. Without education and a healthy life to be brought about by an all-round improvement in sanitary conditions, the efficiency of labour in this country could not be improved. I would also advocate special rates for the carriage of certificated workmen from their homes to the industrial localities and in order to avoid overcrowding in cities I should suggest special rates for working people on the local trains. If better homes were provided they would be induced to bring over their families with them in industrial centres and there will thus be a genuine factory population alert and efficient in their work.

State aid to industry.

I do not think direct State aid by way of subsidy would be desirable. The only case in which an exception may be made would be in the case of industries requiring large sums for experimentation. Even here so long as other forms of indirect assistance can suffice, this plan of subsidy should not be resorted to because it is likely to be demoralising both to those who are helped and to the officials concerned. Advances by the State are to be resorted to freely only in agriculture for improved methods or for introducing new crops, machinery and manures.

If two or three substantial zamindars or local magnates are prepared to stand guarantors, it is a question whether the State should not help in the way of capital by means of a loan for ten years. But the means of recovery and the unpleasantness attaching to it in case of unsuccessful ventures seems to militate against what appears a rather attractive suggestion at first sight.

Nor would I advocate guarantee of dividends for joint stock enterprise except in case of carrying companies as the Government have been doing in the past.

There are however indirect forms of assistance which I should like very much to press to the notice of the Commission. The foremost is the question of industrial banks. These may be started under the auspices of the State. Even here I should not suggest any direct use of Government money. The capital for these banks should be secured by sale of bonds interest on which should be guaranteed by the Government at 5 to 6 per cent. The Government may invest funds from the paper currency reserve and the gold-standard reserve in these bonds within certain limits. These industrial banks should be private corporations working in close touch with Departments of Industries. They should confine their work in a manageable area even if it exceeds the limits of a province. They should have full-time men with business experience as directors and technical men and chemists in their employ for information and advice. Such institutions, the details of which could be worked out by experts would be of very great value.

I would further suggest indirect help to industry in the following manner :—

- (1) *Facilities for insurance* :—British companies have been known to create difficulties : in the case of swadeshi steamer companies they have demanded higher rates for insurance of goods carried by them.
- (2) *Freight* :—Special rates should be given in the case of machinery for a new enterprise : this may be secured by subsidy to steamship companies.
- Land carriages* :—Special rates should be given for the transport of manufactured goods, raw materials, fuel and other necessities for factories.
- (3) Facilities as regards sites for factories, working men's houses, railway sidings may be granted.
- (4) *Re income-tax* :—Until joint stock enterprise begins to earn 4 per cent. it should be exempted from income tax, if it is a pioneer manufacturing enterprise.
- (5) Partial or total exemption from municipal taxation for locations in regard to new industries and working men's houses.
- (6) Supply of cheap power and establishment of Government power stations or taking over electric supply companies by the State.
- (7) Drawbacks on duties on machinery and raw materials in case of selected industries.
- (8) State demand for articles manufactured in India : these being given preference ; in case of inferior quality, better methods may be suggested and insisted upon.

- (9) Monopolies for the manufacture of certain articles provincial or otherwise for limited periods.
- (10) Facilities for the purchase of machinery, through State agencies; at present accurate information is not available as to where the most suitable machinery may be imported from and parties are frequently imposed upon by middlemen.

In order that the benevolent intention of the State can be carried out, attention must be paid to the machinery through which this work would be done. And if the State will take greater interest than it has done in the past, the organisation of the Department of Commerce and Industry becomes a matter of great importance. The present practice of putting in a member of the Civil Service, who has had no previous training, experience or knowledge in any new post of sufficient importance and requiring special knowledge will not do. The Director of Industries must be a living force and not an atrophied and hidebound official. A practical businessman and one known for his interest in and sympathy with Indian industrial enterprise should be a Director. And whoever the Director may be, Indian opinion will regard his work with grave misgivings if he is not associated with a body largely composed of independent Indians—an Advisory Board before whom he should place all his work. The Agricultural Department suffers from the appointment of non-agriculturists and civilians who are constantly transferred. We want practical men in the department willing to listen to suggestions of Indians of standing and experience through the Board. It is also desirable that there should be less red-tape and formalities in the work of the department. All suggestions for a better state of things would result in nothing in the absence of these precautions.

ORAL EVIDENCE, 4TH DECEMBER 1916.

President.—Q. Your note expresses your views with characteristic clearness, and consequently I have very few questions to ask you to supplement what you have already told us. There are one or two points that are left uncompleted, through oversight probably, one dealing with the functions of the State where you compare the population of India with the population of Hungary. You point out that the agricultural population of India is 75 per cent. and in Hungary in 1900 it was 76·83 per cent., the industrial population being only 5·26 per cent. Then you give an account of the sums of money laid out by the Hungarian Government for the purpose of developing industries and you proceed to say "What has been successfully achieved in Hungary may also be done in India." You do not, however, give any further reference to the ratio between the agricultural and industrial population. Do you remember what the figures were after this interval of twelve years?—A. It was a parliamentary report from which I got this. It was submitted to Parliament by the British Consul in Hungary. I have not unfortunately brought the actual reference with me. I can send it to the Commission.

Q. You have no idea as to what the result of the expenditure of the money was?—A. I am only speaking from memory. My impression is that the present agricultural population is about 22 to 23 per cent. in relation to industries.

Q. You mean it has dropped from 77 or 76 to 22 or 23?—A. Yes.

Q. And there has been a corresponding increase in the industrial population?—A. Yes. That is the case with Germany also. I have got this book, "Germany of to-day;" there it gives about the same figures in the chapter on Agricultural Germany and Industrial Germany. "The change is sufficiently striking. At the beginning of the 19th century over 80 per cent. of the population was agricultural. To-day less than 30 per cent. is so occupied. Even in 1895 the proportion was still 36 per cent. and 10 years earlier 42 per cent. and now less than 20 per cent. in Germany."

Q. In your note there is no reference to the source of those figures. I am only asking you to supplement it, with the exact reference and the exact results. There is no use in knowing only what has been spent unless you can show that it has been spent with definite results?—A. I say there "In 9 years ending with December 1898, 1,609 new establishments were started with a total capital of 206,706,814 crowns." Then I give the actual contribution by the State in a particular year. What I have ventured to indicate is that if we follow the same policy or a policy analogous to what they have followed in Austria and Germany—I was not able to get the exact figures of Germany at the time I was writing this note—I think we may follow it with success. I wrote this note rather hurriedly because I was limited to time as the note had to be sent within a particular date. If you will permit me I will supplement it in a supplementary note.

Witness subsequently sent the following supplementary note :—

In the written statement submitted by me to the Indian Industrial Commission during its sittings in Calcutta, I quoted certain figures in regard to the proportion of agricultural and industrial population in Hungary. My figures were for 1900, and in the course of my evidence Sir Thomas Holland enquired if I could furnish him with the corresponding figures of a more recent date. On enquiry I find that according to the census of 1910 Hungary had a total population of 20,886,487. Out of this agriculture and forestry maintained altogether 13,465,658 persons (earning 5,800,602, supported 7,865,051), while industry including mining and commerce maintained 4,298,101 persons. I have got these figures from a recent issue of

the Statesman's year-book (1915). Hazell's Annual for 1916 says that the larger half of the population in both Austria and Hungary is engaged in and dependent upon agriculture.

President.—*Q.* Hungary is a good illustration if one can follow it up, as they start with about the same percentage as in India; and we should like to know what the result has been in 12 years of the expenditure of Government money in order to aid the development of industries. I know Hungary very well and my impression is that it is still mainly agricultural, and I have never come across any other agricultural people so depressed or so miserable as the people of Hungary and especially of Transylvania where they are kept down by the Magyars?—*A.* Vienna struck me as a beautiful city.

Q. We have some figures showing the changes of population that have occurred in the districts around Calcutta since the census of 1901, these changes being largely the result of industrial development, and according to those figures there has been a great increase in the total number of people employed, especially in the mills; but most of these additional labourers in the mills are from outside Bengal, i.e., from the United Provinces, Bihar, and recently there was a large influx from Madras?—*A.* That is so.

Q. Not only has the percentage of local residents gone down but the actual figures have decreased, that is to say, the actual number of Bengalis now employed in the jute mills is absolutely less than it was 14 years ago, while the percentage of change is still more striking. You have been able to survey problems of this kind from outside. We should like to know why the local population have not taken to the chances of labour while there has been an influx of population from outside provinces?—*A.* I have studied that question and I have given a brief summary in my note as to the reason why Bengal has not been drawn into the industrial life. The peasantry in the United Provinces and especially in Bihar where they depend upon two crops only is worse off than the peasantry in Bengal where with a good and well distributed rainfall and with fixity of tenures and fixity of rents they are much better off financially, and life in the mills is not attractive to the rural population of Bengal. I am connected with Bihar from which a large amount of labour is imported. There the conditions are these. The men are working here for a part of the year except when the paddy has got to be cut and they supplement their little resources by their earnings in the mills here and it was that what saved Bihar during the scarcity in Sir Edward Baker's time when he was administering Bengal. There was severe scarcity and severe drought, but there was nothing like famine because the labourers were working here and were able to send money to their families in Bihar. What I say is this, that unless we impart to the labourers a higher ideal, a higher standard of life, you will not get in Bengal—I am only speaking of Bengal which I know well—a sufficiently large labouring population. From East Bengal you cannot get any, because the rice in Barisal and the surrounding districts is such a plentiful crop and so well assured that people will not risk giving up their rice fields for labour in distant places like Calcutta, and jute has transformed the agricultural population of East Bengal into fairly well-to-do peasant proprietors, and therefore the only field of labour is West Bengal. And then unless the conditions are much better and unless you give them some education, and give them a wider outlook on life, a better ideal as to the standard of living, you cannot get labourers here. With the more or less loose lives that the coolie population have got to live, with practically no facilities for education, with a large number of men and women herded and living together, you cannot expect to draw into them the agricultural population of Bengal.

Q. Then your cure would be a more generous policy in the way of primary education?—*A.* Yes.

Q. In other words—we do not want to cast any reflection on the people outside Bengal—you practically come to the conclusion that life in jute mills is good enough for them but not good enough for the people of Bengal?—*A.* I do not wish to cast any reflection. There you have got the stimulus, the sting of poverty and destitution. Here you have not got it.

Q. We do not want to go into questions of educational ideals. You know it is beyond our province, but we cannot help looking at the question to a certain extent with a view to finding out whether want of primary education, or industrial education, or technical education is in any way a bar towards industrial development?—*A.* Yes.

Q. We should like your views on this point, and we will try to avoid going purely into questions relating to educational ideals. What we want to know is whether and what kind of education is really wanted?—*A.* What I say is this. Apart from the methods that I was just now referring to in connection with the difficulty of procuring labour from Bengal itself for Bengal industries, there is the big question of wages. The wages at present offered will not attract the prosperous agricultural population—the word “prosperous” is too much, I may say fairly well-to-do population, that is, the relatively prosperous agricultural population in Bengal. Secondly, as I have said, their outlook is very limited as regards their future, and thirdly I think whatever may have been the beneficent results of the education imparted it has been entirely one-sided. The education so far imparted has been practically literary education. I have had something personally to do with the starting of a few industries in my province. I do not say that I came off out of them well, and the difficulty is this that it is very hard to procure boys or young men who had been industrially trained, trained in the habits of discipline, obedience, working in regular hours and whose eyes and hands had been trained in particular directions. There are industrial classes amongst us, Bengalis, but they are more or less concerned, as I have stated in my note, with the industries belonging to their castes or

guilds. It is difficult to get them away from their respective professions. What I want is this. I see a great waste of human material that is going on under our present educational system and that waste may be easily saved for the benefit of the community if the lads of the population following agricultural and industrial pursuits were given some training which would render them useful as workers in any industrial concerns and which would make them valued for their skill and adaptability. I do not profess to say or believe that the schools can turn out finished articles, but they could train boys in habits and modes which will make them adaptable workmen when the work comes.

Q. In all forms of industries, as in all forms of business where competition is keen, there is no doubt that you will agree, probably above all things the value of discipline is very great?—A. Yes.

Q. I am speaking now with regard to the educational system at home as much as in this country. There has been a great slackening in the matter of educational discipline since the departure from the old times when our classical schools at home were almost essentially training boys in mental discipline, without regard to the actual value of the material imparted by way of education, and this discipline was carried out not only during class work but outside the schools by the boys themselves; and possibly in some cases it was overdone. You say we have transplanted into India a form of literary education which has found a congenial soil in the speculative genius of the people of this country. The higher castes among the people of this country have inherited literary and philosophical instincts of a kind that those of us in Europe cannot help admiring. Do you think it is fair to say on the whole that the speculative aspect of mentality is greater in India than it is among the peoples of Europe; are you more given to literary and philosophical work? Is that correct you think?—A. That is a very sweeping statement to make, but nevertheless we cannot overlook the fact that some of our castes and communities have had literary training from time immemorial, from a time much anterior to the period when Europe began to take to literary pursuits and naturally you cannot overlook the factors of heredity and environments, and consequently without any disparagement to our people or disparagement to the people of Europe I have found that we, the people of India, at least amongst the classes whose ancestors had been occupied with literary pursuits, are more apt than probably the peoples of Europe to take to philosophical pursuits, and I may say from my own experience both in Germany and in England, that curiously I found that the regions of speculation in philosophy, mathematics, and science into which the Germans had gone appealed to me more strongly than the universities in England did, for example, Oxford and Cambridge. The commercial universities stand apart. In the literary universities, somehow or other I found I was more in sympathy with the higher speculation of the German philosophers or mathematicians or scientists than with the work—I make very large exceptions—generally done in English universities.

Q. I should like your judgment on this proposition. It is another one in which my best friends do not agree with me entirely, so I want your independent judgment. For many years I have seen confirmation of the idea that education, if it is to be of real educational value, must be of the kind that forces into a student something that he does not like. There is no tonic which is not poison, but it is poison given in judiciously small doses. I give you this illustration, that I came across during my monsoon tour. There is a tree called the dhawa tree, which, in the old days, was used largely for tanning. That tree ordinarily does not give rise to fertile seed, but in the attempt to get enough tanning material from some of the plantations in Central India, by lopping off the shoots and leaves, some of these trees began to give a fruitful seed. It had its life threatened and at once turned to reproduce its species. It is dangerous to generalise from these natural laws as regards the problems of human nature. Do you think it is likely that the classical education which has been forced into the practical minded English boy has done him some good, and that, possibly, on the other hand, the literary and philosophical education which our Oxford educationalists have imparted to your people who are, as you say, endowed with speculative genius has resulted in their running into literary grooves in life?—A. On the first question my answer is in the affirmative, namely, that the study of classics has been of the greatest benefit to the English youth. If a man must live for something higher than what he is within himself, he must learn to have a nobler ideal of life, and for widening the natural horizon for a discipline of the mind, a study of the classics has been of inestimable benefit to the western youth. To us it has also done some good. I will not go into the very vexed question as to the relative merits of the classics in the east and in the west, as to the relative merits of the respective systems of philosophy. But we have come to realise that outside India is not all occupied by barbarians and we have come to realise that there is much to learn even in regions of speculative thought from outside, and that has done us a lot of good. It has taught us a true sense of proportion even in the atmosphere of mentality between the different races of the world and it has given us a glimpse of what a more robust life has been able to achieve in the domains of speculative thought.

Q. Coming down to the question of practical application to the training of boys, your people have inherited a beautiful philosophy and they have been taught to revere their philosophy and have got good reason to revere their literature. Do you think that we ought to have gone further and introduced them to something that was apparently not suited to their nature or outside their nature in order to give them a better balance?—A. I think that is right.

Q. You think that we ought to have introduced, for instance, instead of, or in addition to Chaucer and John Stuart Mill, the lathe and the forge?—A. Yes. We may have them supplemented by it. You know there are industrial classes in India by heredity and also commercial communities. These were a part of the social frame of the ancient Hindus, and they are even so at the present day. What you have done is this. You have conserved the priestly classes as pandits and you are slowly converting our industrial classes into pandits. What good is it to learn Anglo-Saxon grammatical forms out of Skeats? There I believe the mischief has been done—I do not say it was done intentionally—and we have got to reconsider and relay the lines to keep a good balance between intellectuality and industrialism. Our forefathers treated it in a different way. We have probably got to meet it under different conditions and on different lines now at the present moment.

Q. Your industrial population is on the whole comparatively among the low castes, and as the census reports show they are comparatively low in average education. You want the very best people in the country to take a share in industrial work. Don't you think that we could have managed to have imparted a better form of education suitable for the industrial development of the higher castes?—A. Yes.

Q. It is obviously these people you would really look to help their neighbours?—A. Men belonging to the higher castes have taken to the leather industry, to shoe making and other ordinary pursuits, and if a greater degree of attention was directed in that direction I am quite sure that our intellectual classes would feel that they are capable of taking a larger share in the industrial life of the country. At the present moment we labour under a sense of ignorance and diffidence because of our want of training, and it ought to be the object of the State in order to get, as you say, the best result, to educate those who are more intellectually advanced than the others in ways which at the present time are considered beneficial to human progress if not subservient to human happiness.

Q. Apart from the question of whether the higher castes should take to industrial occupations I gathered the impression during my monsoon tour that the artisan classes are unable to progress simply because they are deficient in the very elementary form of education, they could not for instance read a thermometer, or make a simple drawing?—A. You are quite right. That is the great difficulty which stands in our way in introducing better methods, either in agriculture or in the ordinary industries. That is the greatest difficulty with which we have been faced.

Q. Would you like to see manual training introduced in the primary schools, or would you like your primary schools to be confined purely to literary subjects and industrial schools provided as an additional training?—A. On this question I can only speak from my studies and not from my experience, because unfortunately in India we have got no industrial schools. From what I have been reading of Japan, Austria and Germany they have combined from the beginning in the elementary schools industrial and literary training in a small degree. I think both the mind and the faculty which is necessary for industrial enterprise should be developed *pari passu*.

Q. That opens up a very big practical difficulty. As you know at present, the schoolmasters in the primary schools are paid on a scale that makes it impossible for us to expect from them good teaching in the matter of literary subjects and knowledge of the methods of manual training?—A. Have you any idea as to what the gurus get?

Q. I have come across a school of 200 boys with a headmaster on Rs. 25, a second master on Rs. 15, another on Rs. 12 and another one on Rs. 10.—A. I was talking of the primary schools where you have got a class of teachers who are known as gurus. Up to the time of the administration of Sir Andrew Fraser in Bengal they were getting a pay of Rs. 3 a month which was supplemented by the boys, who were taught to take away from their homes some food or some articles even if their parents did not like. I was instrumental in getting their pay raised to Rs. 5. Not only here, but everywhere we are apt to depreciate the value of the teacher too much. I know the practical difficulty and it will exist for a long time in this country.

Q. Because of the financial difficulty?—A. Yes. But a beginning may be made and as your question suggests, probably for some time to come we shall have to provide in agricultural and industrial centres primary schools for the agricultural and industrial people for that kind of teaching, leaving generally the literary teaching to other elementary schools, and as our financial resources developed, and as we get more teachers who were the products themselves of these schools and of the continuation schools which ought to come into existence with them, the system might develop. In any scheme that the Commission may frame or we may suggest, you cannot expect to create a transformation with Alladin's lamp, and we must proceed by slow degrees. Unfortunately the slowness with which you have proceeded so far has been almost comparable to the slowness with which a policeman goes to the scene of riot. But I think that if we make a strong effort and we are satisfied with making a satisfactory beginning that ought to help us to get along.

Q. Don't you think you show a want of faith when you say that you cannot expect any improvement within a very short time? My idea is that if we tackle this problem with real faith we may see results even in my lifetime?—A. You may see results in your lifetime and even within my lifetime. Without any question whatever, the Government or the people have not followed any definite policy in this matter. The result of a definite policy being followed, I am sure, will yield results within a measurable distance of time. Take, for instance, university

education. I am told, that when the first Hindu student in the Calcutta Medical College was induced to perform an operation upon a dead body guns were fired from the Fort William in recognition of the fact that a Hindu got over the prejudice of touching a dead body.

Q. What year was that?—A. It was somewhere between 1836 and 1837. After the Medical College was first established Madhu Sudan Gupta was the first man. In the course of 20 or 30 years we got a very fine class of Indian surgeons and physicians, and so I do not see why if we fire a gun when the first Brahmin begins to make a shoe now we should not get in thirty years quite as satisfactory results.

Mr. C. E. Low.—Q. You know that the percentage of persons who have received primary education is higher in Bengal than in any other province?—A. Yes. That is due to private enterprise.

Q. But as a result of that, people have not been drawn towards industries or agriculture? No, because that primary education has been literary education pure and simple.

Q. But there is a large industrial population in Bombay where presumably they have the same system of primary education?—A. But the conditions of life are different.

Q. The peasant cultivators of East Bengal, you say, are better off than these of North and West Bengal?—A. Yes, especially West Bengal.

Q. Do you know that out of the few Bengali factory hands a larger number of them come from Western Bengal than from the Eastern Bengal?—A. I have not had any personal experience of that matter myself, but I have found generally that it is difficult to get Bengali workmen except for very high wages, especially for skilled labour.

Q. Is it not the case that a far smaller proportion of *bhadralogs* in Bengal cultivate their land as compared with the educated classes in other provinces?—A. I am inclined to agree with you. It is so, that the *bhadralog* class in Bengal do not by themselves cultivate the land, whereas a Brahmin in the United Provinces or Oudh will cultivate land himself. There is a very big question involved in it—the system of land tenures prevailing in Bengal. The present state of things is this. I am a middle class Bengali, for instance, owning a small estate. I have got tenants settled on it from whom I receive rents. My dues to the State are fixed, and practically the dues that I get from my tenants are also fixed. This is the case in Bengal because the State is not the landlord, it has done this for the peasantry. It has stepped in between the landlord and the peasantry and has prevented the landlord from enhancing the rents except under very strict conditions which are more or less impracticable of being complied with. It is like the Land Act in Ireland introduced during Gladstone's administration in the eighties.

Hon'ble Sir R. N. Mookerjee.—Q. In theory?—A. No. I am a zamindar myself and I am saying so with experience.

To Mr. C. E. Low.—Q. It is very difficult to increase the rents and the lands are not with the middle class,—the *bhadralog* does not cultivate nor is he owning the land except as receiver of rents. He is nothing more. There are few people of the *bhadralog* class who are really in actual touch with the soil holding direct possession as cultivators or growers of any produce. In Bengal the middle class man keeps a few acres for growing his paddy, straw and things necessary for his household use which he cultivates, and the rest he lets out to the tenants.

Q. Does he not grow his paddy through the agency of tenants on half produce tenure?—A. Yes, on half produce, or he sometimes pays for the labour. There is a class of land in this country which belongs exclusively to the owner of the soil and to which a tenant cannot acquire a right of occupancy.

Q. Turning now to the cultivator, is it not the case that there is only a very small class of cultivators corresponding to the respectable agricultural classes—comparatively higher classes—in other parts of India, like Kumbis, Rajputs?—A. I do not know of other parts of India except Bihar and parts of the United Provinces. The cultivators there are a better class of men than in Bengal.

Q. You agree that the cultivator class in Eastern Bengal comes from the Namasudras and Muhammadans?—A. Yes, that is generally true.

Q. If one can go back a certain number of years, say fifty or sixty years, to a time when very few *bhadralogs* were engaged in Government service, they mostly lived on land?—A. Yes.

Q. At that time did they cultivate or simply live on rents?—A. They did not cultivate. They simply lived on rents or produce of hired labour.

Q. The results of the inquiry made by the Government some years ago show that practically no *bhadralogs* were engaged in jute mills?—A. I am just now running a hosiery factory and I do not know whether it will succeed or not. 75 per cent. of my workmen are Brahmins. Here is a sample which I have brought for your inspection. (Witness shows one banian.)

Q. Of course you cannot cover a large number of people because there are not many industries of that sort. But speaking of the few industries, the *bhadralog* class seem to engage more readily on manual labour in enterprises conducted by Indians. Do you consider that it is generally true?—A. In my small experience I have been able to get workmen from *bhadralog* class without much difficulty, from boys who are not earning a decent livelihood in other occupations.

Q. To what do you attribute that fact, as compared with the jute mills where you get no *bhadralog* working in manual labour?—A. In answer to your question I give you another

experience of mine. I am connected with a swadeshi hospital in connection with a swadeshi medical school. I am using the word "swadeshi" in no offensive sense. I find that poor people come to us in large numbers from long distances in preference to Government institutions managed by Europeans, which may be nearer because they feel that they would have more sympathetic treatment.

Hon'ble Pandit M. M. Malaviya.—Q. You have spoken of the results of State action taken in Hungary and Germany in converting a largely agricultural population into an increasingly industrial population. You are aware that that has been the case also in Japan? —A. Yes.

Q. And in the United States of America to a large extent?—A. I have not studied much the conditions of the United States, but Japan I have studied, because we thought we might adopt some of its methods, and Austria and Hungary we are bound to study because of the advance made by them.

Q. And you have noted in the case of all these—Hungary, Germany and Japan—that they have reduced their raw exports and increased their manufactured exports?—A. Yes, greatly, I have given the figures in the case of Hungary.

Q. Have you noted that in the case of Japan this was effected practically in the course of 20 years between 1890 and 1910?—A. In the course of thirty years.

Q. There was a good deal of discussion about the inherited tendencies of our people for philosophy and literary pursuits. Is it not a fact that until a few decades humanistic studies predominated in all the universities of the world?—A. Yes.

Q. Is not the systematic study of applied science a recent development?—A. Yes, except medicine.

Q. Even in the case of Oxford and Cambridge they have not yet got over that feeling, that humanistic studies should predominate in the universities?—A. Not quite.

Q. So far as these are concerned, as tastes and temperaments vary, don't you think that even when science has made the greatest progress, there will be some who will be drawn more to literary and philosophical pursuits than towards science?—A. Yes.

Q. You cannot expect that all or the majority of students in any country at any age will be drawn only towards applied science to the exclusion of literary and philosophical studies?—A. There is one thing which I wish to interpose here. I believe India is the only country where poverty was never considered a crime. Men were proud to be poor and therefore our ancestors oftentimes gave up the path which would lead to riches and chose the path which kept them in poverty, because they thought that that was more ennobling for the soul than the other. I do not think that it is a trait which you will find outside India, at least to the same extent. Even to-day thousands of young men of the *bhadralog* class voluntarily choose a life of poverty in taking up studies which they know will not bring them any benefit. That is a peculiar thing in our national life among the higher castes.

Q. And in support of what you say, you would probably refer to the study of mathematics by the pandits?—A. Mathematics, Vedanta philosophy and Nyaya philosophy.

Q. Is it not true that since the time that the present system was introduced by Government our education has been more dominated by literary and philosophical ideals than by the scientific ideal?—A. Certainly. Government, as you know, introduced scientific studies in the early seventies.

Q. It was only theoretical science?—A. Yes. In our days nearly all the experiments were performed in chalk on boards by a gentleman who was the first or second wrangler of his time.

Q. You have also spoken of the readiness with which the Brahmin and the Kayastha boys have taken to medical studies. That is also the case with engineering pursuits?—A. Yes. With scientific chemistry, applied physics and things of that kind.

Q. Is it not a fact that during the last fifteen or twenty years our students have taken quite as readily to scientific studies as they have taken to almost any other?—A. Yes. In fact they have taken to western methods, some of them with a vengeance.

Q. Can you tell us what is the number roughly the Association for the encouragement of the study of science abroad has sent out to America, Germany and England, say during the last six to ten years?—A. It is between 400 and 500 students.

Q. What is the name of the Association?—A. It is the Industrial and Scientific Association. The funds are very small.

Q. What is the amount of help that they give?—A. It is very little that they contribute. The boys have got to work as menials in America, some of them as shoeblocks, some of them as mechanics. They beg and borrow for their passage money from their friends and others who are willing to pay. They get Rs. 30 to 40 from this Association and the rest they procure by manual training or contribution from willing friends here. There are great difficulties.

Q. Among the students who applied for help, do you find a large number of Brahmin and Vaisya and Kayastha boys?—A. Mostly. Largely.

Q. Do they go abroad to obtain instruction in various applied sciences?—A. Sciences and industries.

Q. So that if you have provision for higher technical and technological instruction in this country there will be no lack of boys to avail themselves of it?—A. Because hunger is the great stimulus.

Q. You spoke of the difficulty about the salary of teachers in primary schools. You are in favour of compulsory free education?—A. Certainly.

Q. You spoke of the salaries of teachers of the primary schools having been somewhat raised? Was it recently?—A. In the last 10 years.

Q. Is it now Rs. 10 per mensem?—A. Rs. 8 to 10 in Bengal. I do not know about the United Provinces.

Q. Have you noted that in Japan the salary of teachers in primary schools is Rs. 12 a month?—A. I do not know.

Q. And 3.36 dollars in the United States, that is about Rs. 10-8?—A. I do not know. The teaching profession is very ill-paid everywhere.

Q. So that you will agree that the fact that we cannot afford to pay our primary school teachers as much as we should like to, should not stand in the way of spreading education among the people?—A. With the instructors we have got and the means we have at our disposal, we should spread education as broadly as possible. We should go to the extent of levying an educational cess if necessary.

Q. You have stated that in the general elementary education course you would introduce a little training in elementary science and manual work?—A. Yes.

Q. Is that the system in Japan?—A. Yes. In Germany also.

Q. You would introduce it either in the ordinary primary schools or in supplementary classes?—A. Yes.

Q. You also consider it necessary to impart commercial training so that our young men should become captains of business?—A. They might have some idea. Just as in the case of law if you give a lawyer a law degree he only reads the books and gets some ideas of the principles of law and finds it easy to get into the practice of law because of the knowledge of principles, the same knowledge of principles in commerce is necessary. By the way I may tell you this. There has been some criticism about the commercial schools in certain quarters, namely that mere scholastic education in commerce will be of no avail. I saw the Germans giving instruction to their boys, and they give commercial instruction to their boys who want to take to a commercial career. They have got a certain selected course which gives them a knowledge of the principles in which exchange of commodities takes place, some knowledge of commercial law, some knowledge of exchange and other things which are of very great assistance.

Q. You think that provision for giving technical education which will help students to produce manufactures is not more important than provision for commercial education which will enable our students to obtain supplies of materials and to market goods and to finance business?—A. Yes. Both are necessary.

Q. And towards that end you would strongly advocate the establishment of one college of commerce in every province?—A. Yes, and certainly commercial schools.

Q. You have spoken of industrial schools. You know in Japan they introduce commerce as a subject in the industrial schools. So, if you have not separate commercial schools would you make commerce a subject in the industrial schools?—A. In the secondary stage.

Q. You are strongly in favour of an industrial bank?—A. Yes.

Q. Do you think that it may be started under the auspices of the State?—A. Yes.

Q. This is one of the indirect forms of assistance which you advocate that the Government may render?—A. Yes.

Q. Do you think that if it is started under the auspices of the State the public will willingly subscribe the money that is necessary for it?—A. There will be no difficulty about money.

Q. You suggest that the Government should guarantee interest on the bonds which these banks may issue, say at 5 or 6 per cent.?—A. Yes.

Q. Do you think that if the Government guaranteed interest at even less than 5 or 6 per cent. the public would come forward to subscribe?—A. If the Government guaranteed even 4 per cent. the public would subscribe.

Q. You want the moral support of the Government much more than the financial support except in the way of this guarantee?—A. If the people feel that there is behind a concern the vigilance of the Government and its guarantee there will be no difficulty in getting money. You put money at 8 per cent. in your savings banks. What is the amount of the savings banks? It is some crores of rupees. The interest there is less than 3 per cent.

Q. You think that this bank should have men with business experience as directors and that it should have also technical experts in its employ for information and advice in regard to projects for which help may be sought?—A. I may illustrate my point. I start, for instance, a hosiery industry. I bring out machinery from England. I go to the ordinary bank. Assuming that I am a man of means, I say, here is my machinery which I have ordered, will you kindly lend me so much and I will furnish so much as margin. The ordinary bank manager has not

got the experience, he does not know whether the hosiery business is likely to succeed, he does not know whether I have ordered the machinery from the right class of people, whether the price I have paid is the proper price, whether I have got men who will be able to organise and start and carry on the industry, and he naturally refuses. If you had a banker with business experience, both commercial and industrial, whose duty will be to know these things, then I would get my advances much sooner, not only against my machinery but also against my produce and things of that kind, much sooner than I would get from an ordinary bank. As an ordinary banker I would refuse to lend money. If I was an industrial banker and if I were satisfied with the conditions that the industrial bank manager should wish to be enforced, I would readily give you money. In one case I would not have knowledge and in the other case I would have knowledge.

Q. Is it on the model of the industrial bank of Japan that you propose such a bank ? —There is an industrial bank in Germany and in Japan working on similar lines with branches. Besides the bonds you have got enormous gold reserves.

Q. You suggest that a part of the gold reserves of the Government should be available to help a bank of that kind ?—A. Yes. What is the use of these reserves being lent out in England on short credits at nominal rates of interest ?

Q. Do you know what it at present amounts to ?—A. No.

Q. You know that at present Government does help the Presidency Banks with the reserves ?—A. I am aware of it.

Q. And you know the extent to which it does ? The nominal amount is 70 lakhs for the Presidency Bank of Bengal, 50 lakhs for Bombay and 50 for Madras ?—A. I think so.

Q. In practice it goes much above those figures ?—A. That I do not know. I have referred to the Bank of Bengal for information but I have not got it.

Q. The Government reserves are of help to business men in England also in some form or another ?—A. They are of very great help. You see the financial adviser to the Secretary of State is an Englishman of business connected with English commercial and industrial life. There are two financial advisers. I do not know the present gentleman. I think one is Sir Philip Schuster.

Q. The Secretary of State has got two financial advisers on his Council ?—A. Yes. Both of them are English commercial men, and consequently without meaning to cast any reflection of undue treatment they would naturally be inclined to place greater reliance as regards safety of investments on English securities than on securities of which they have no knowledge. I have not got the figures just now, but up to last April the gold reserve in England was about 26½ millions of which 26 millions was invested in England.

Q. In British securities ?—A. Short credits to bankers and things of that kind which ease the British money market or help it to a great extent.

Q. Without going into the exact figures, we can say that a portion of these reserves is available to British business men ?—A. Yes.

Q. On very easy terms of interest ?—A. Yes.

Q. And a handsome portion of the Government reserves is available to European merchants generally in this country through the Presidency Banks acting through exchange banks ?—A. The Presidency Banks, I believe, hold the ordinary cash balances, not the gold reserve or the fiduciary reserve.

Q. A portion of the Government reserves is available to business men here through the Presidency Banks ?—A. Yes.

Q. It is available, I have been told, to European businessmen, but not in a similar manner to Indian businessmen. Have you any information on this point ?—A. I lay some emphasis on the expression that you have used "in a similar manner". I know that facilities are given to our people also, but I believe we, the people of India, have to satisfy more stringent conditions than the European in India has got to. I do not impute to the bank any question of partiality. It is probably because the European is a much better business man and the bank feels more security.

Q. I want to get at the fact of the matter ?—A. It is a fact that facilities are greater.

Q. You say "Whoever the Director may be, Indian opinion will regard his work with grave misgivings if he is not associated with a body largely composed of independent Indians—an Advisory Board before whom he should place all his work." Would you make the Director bound to carry out the decisions and recommendations of this Advisory Board or would it be a purely advisory board ?—A. That is a matter of detail which I have not thought out, and I do not wish to give an answer.

President.—Q. Most of the European firms are established houses of long duration ?—A. The bank has not got the facilities for ascertaining the real credit of the Indian customers as much as of European customers. For instance, in the Presidency Bank I do not suppose there is any Indian director, nor has there been.

Q. Are there many Indian shareholders in the Presidency Bank ?—A. Yes. I believe some of them hold large shares, but the number of shareholders is small.

Q. There has never been any Indian director on the Bank ?—A. This Presidency Bank does not call general meetings. They elect their own members in a particular way, and not

through the shareholders in a meeting. I am a shareholder of the bank and I have never received notice of any meeting.

Hon'ble Sir Rasulbhoy Currimbhoy.—Q. Are these 400 or 500 boys who returned from Japan, employed in any concern?—A. I will tell you. I do not think these boys have received a thorough grounding in the subjects which they have taken up for learning. You see after you learn the theoretical part you have to be in a workshop for a certain time and you have to learn the process, first of all the manufacturing process. Secondly, as I have said in my note, there is a dearth of commercial men to put the products which these boys are able to bring forth into the market, and that I have seen in my own experience. The boys who came back after learning some pottery work, at first were unable to produce a quality which would be acceptable to the market. Then I know that the gentlemen who were interested in this work sent a man up at their own expense to finish his education as far as he could because from business men the trade secrets are very difficult to get at.

Q. Do these people who come out from the other countries after the little experience they get come to the top and start an industry and become the head?—A. You know we have not got the top or bottom.

Q. When you start new swadeshi concerns you bring out these men after education in foreign countries and do you put them at the head of a department?—A. Yes. He is the boss of the show. He is the manufacturer, the commercial agent, everything.

Q. You do not bring experts from outside?—A. No.

Q. And you do not let him commence from the beginning?—A. There are difficulties. Many of these concerns are under-capitalised. For the hosiery business, in which I was interested, we brought out a man from England on a salary of Rs. 350 to 450 a month and he knew only one department of the work and we ought to have two more men, but we have not the means to employ them and the whole thing came to grief.

Q. Are you connected in any way with the industries you mention here, at present, the Cotton Mills, and the Bengal National Bank?—A. At present I am not.

Q. Only with the hosiery?—A. Yes, except that I am a shareholder in those concerns.

Q. Do you think there are any prospects of this hosiery company competing with the goods of Japan which are being dumped into this country at lower prices?—A. I will tell you my own experience about hosiery. First of all, we produced articles which were not according to the requirements of the local market, they were either too expensive or too coarse. That spoilt our chances to start with. Then was the great competition against Japan, but now in Bengal there is a feeling against Japanese goods. When once you wear an undershirt made in Japan you can never wear it again. They have found that out. This is a sample of what we produce in our factory (Witness shows one banian). We are selling it at Rs. 7-4-0 a dozen. The hosiery factory came to grief and was wound up. Instead of selling the plant as scrap iron I thought I would make another attempt. I got a manager and he has been producing for the last two or three months, and I can produce three hundred dozens a day from my concern. We started not wholly with intelligence and knowledge and I am reduced to the least factor in the matter of production but I can produce 150 dozens a day. I am handicapped by the scarcity of yarn. German goods are not coming and the non-import of foreign goods, except from Japan, is in one sense an advantage. On the other hand the yarn which I was buying at nine annas a pound I am buying at Rs. 1-4-0 a pound and the price is going up every day. Even with this difficulty of price I find that during the last two or three months this produce has taken the market.

Q. Do you think that after the war you will be able to prosper?—A. I think I would, because my cost of production will go down, and I will be able to revise my prices and I shall be able to hold my own against the Japanese goods.

Q. With good results?—A. Yes.

Q. Can you tell us anything about this Bengal National Bank. Are they lending money to business, or are they simply doing shroff's business?—A. When I was connected with it it did use to lend money to industries.

Q. And made any loss?—A. The loss was owing to certain frauds.

Q. Do you think that if a commercial and technical college is established in Bengal, Bengal will take advantage of it?—A. Yes.

Q. Do you think that some of them will prefer it to literary education?—A. Yes. Because the market for literary education is over-stocked.

Q. You talk of an industrial bank. You have just said to the Hon'ble Pandit that if the Government guarantees four per cent. they will be able to raise money?—A. Yes.

Q. Can you tell us how this money should go to the industries? In what way?—A. I can tell you my idea. Supposing I am importing machinery worth, say, £10,000, I could secure myself, say, £4,000 pounds and I want the other £6,000. From an ordinary bank I cannot get it. When the machinery is landed at Calcutta I can get it from the industrial bank. The Bengal National Bank made some advance to a bucket industry which a man had started in Calcutta, the improved methods about which he went to England to learn, and when I was in the bank that industry was doing very well, but there was a difficulty of importing iron sheets and the bank helped the industry a great deal.

Q. If you are importing machinery the directors of the bank do not know what is the value of it or whether it is suitable machinery. If you have a Board of Industries in every presidency with a Director of Industries as the executive officer and if these people recommend that this machinery is suitable and that the Government experts advise it, don't you think that then only the bank should advance on these things? Don't you think it will be the safest way? In every presidency the local people know what industries will flourish in that province. Do you think that machinery will be all right?—A. I may only put my view because I have not seen the working of an industrial bank. Now if I go to Government for any advance, assuming that the Government is willing to advance, in the first place it is very difficult to approach Government for an ordinary man. There is too much of solemnity and form and dignity in approaching a Government official. I mean no disparagement to anybody. I go to the Minister of Commerce and Industry. He has no knowledge personally either of commerce or of industry. I am only assuming a hypothetical case, and I am not referring to any individuals.

Q. The Director of Industries is a business man?—A. He is, but he must have a guide. For instance, my friend on my right (referring to Sir D. J. Tata) is a great man in his own industry, but if I start a weaving concern or a hosiery concern he would not be able to advise the Government. You cannot have a Director of Industries who would be conversant with the various directions in which industries may be developed in an infant country like ours, infant in industrial growth. Whereas if you have got a bank where you have got only business men—I know the difficulties from the business point of view—with industrial experts to guide them, then the position is easier.

Q. You think there ought to be some machinery which will guide the Government bank to advance money?—A. Yes.

Q. About research work can you give us your ideas?—A. I am a grower of indigo and I have felt and I have suffered, I, along with other indigo growers, by reason of what I may say the culpable negligence of the State in regard to the indigo industry in the past, and if we had a research institute which could properly look after the interests of indigo growers things would have been very different from what they are during the last ten or fifteen years.

Sir D. J. Tata.—Q. You say "A very serious difficulty has been created by the fact that the existing system of education, while it has greatly liberalized and stimulated the mind of the country, is far removed from the actual facts of life which young men have to face when they are called upon to do practical work, and the result is generally disappointing." If practical education such as you suggest here were available would the people of Bengal take to it readily?—A. Yes.

Q. Does it necessarily mean that liberal education does not make a man fit for work in industries and commerce? Need the men actually be brought up in industries and commerce to be successful businessmen or industrial men?—A. No.

Q. Why do you want special industrial education?—A. I hope you have not had the same experience that I have had of spending four years of the best period of my life in getting up by heart passages from Shakespeare and Chaucer. Whatever may be the innate results of that process, the sum total of the net result is bound to be harmful in the sense that you are developing one side of the intellectuality of human assets and neglecting the other side. I am the last man to say that you should not have liberal education. I may tell you the experience of several of the Bengali middle class households. Every boy from the age of five is put upon a curriculum that he may, when he is a young man, be either a doctor, or a lawyer or an engineer. We have not got the capital. We have not got the place where we can teach them business. We have not got workshops or schools. Some of our boys are bright lads and the millstone does not grind them down. They go through the course all right. But the others are weak and they become wasted and you lose very valuable human assets. They run to the university. Probably the boy is not fitted for that education and he goes off the line and there you have got all the mischief from which we suffer at the present moment in Bengal.

Q. Is it not so much the fault of the recipient of the education as of the educational system? Why need the system be necessarily wrong? In England liberal education does not necessarily mean commercial or industrial education. Yet some of the most successful industrial and commercial men are men who have only received the ordinary liberal education in the universities. They are not specially trained. Why should not that happen in this country? Is it not owing to the peculiar character of the Indian student?—A. No. I will tell you. You will forgive me for giving my answer a personal tone. Suppose you had a grown up son who had come out as a graduate of an English university. After he had come out as a graduate you would take him with you in your business or with your influence you would put him in some other business house and he would have the benefit of having his liberal education supplemented by practical and commercial education. Where have I got your position, or patronage, or your friends? What is my son to do after having received liberal education? He must either go to law or medicine or engineering, or must go about committing dacoities to earn his livelihood.

Q. After receiving this education why should he not apprentice himself to some industry?—A. In the first place, we have not got the industries in Bengal, and in the second place you must not forget that by the time he gets out of the college he is about 24 or 25 and he is probably a married young man with probably a small family.

Q. The point I want to bring out is that the average Indian, perhaps more in Bengal than anywhere else, does not recognise the dignity of labour. He becomes a graduate as a means towards the end, that is he wants to be a graduate so as to earn a living. He will not work with his hands. If he is willing to work with his hands, I believe, in some industrial concerns in this country, there are many openings for our graduates. Do you think that the boys would be prepared to work with their own hands—I mean undergo manual labour?—*A.* Have you seen the conditions in which our students prosecute their studies? Ill-fed, with ill-ventilated rooms in their homes, with the same conditions in the college, ill-fed, underclothed, starving, physically oftentimes a wreck, with sight gone, with limbs weak, with a mind filled with high ideas, do you think he will take to manual work at that time of life, or would he be a good workman if he did take to it? Don't you think that there is something in the Indian system of caste where each craftsman is to begin his life early so that he may be a good workman, and is it not the same even under the modern conditions, if you want to take to manual work you must begin sufficiently early? Do you know of many cases in England where students having graduated from Oxford and Cambridge have taken to manual work as workmen?

President.—*Q.* That is often the case. I was myself an apprentice on a small salary and had to do manual work.—*A.* In the Engineering College at Sibpur they have to work underground as miners.

Hon'ble Pandit M. M. Malaviya.—*Q.* Are not some of our young men prepared to do that work? *A.* Yes. I will tell you my experience of our young men. I am referring to the organisation which probably many of you have heard of—the Congress organisation. In that organisation we have always to employ a large number of volunteers. They are young men of high families, mostly of the higher castes and generally of the highest families in wealth, rank, and social status and everything. They work as our menial servants, as sweepers, etc. One Brahmin in Lucknow acted as mehtar when I was there and they never complained because they felt that it was service that was needed of them. If it is needed and if the opportunities are open I do not think our young men will shirk. I have a much better opinion and a much more intimate opinion of our young men.

President.—*Q.* That is patriotism. One would like to know whether they would sit down and qualify themselves for actual business in the same way as a mining student in England has got to do?—*A.* I do not think you lack the material.

Hon'ble Pandit M. M. Malaviya.—*Q.* You do not think our young men will shirk or will fall back?—*A.* No. At present there is no opening.

WITNESS No. 103.

Mr. S. H. Farrington.

MR. S. H. FARRINGTON, *Managing Director, North-West Soap Company, Limited, Calcutta.*

WRITTEN EVIDENCE.

The only thing that strikes me is that English and Continental firms can compete with Banking Facilities. us as they get cheaper money. When they borrow on good security they get money at 3½ or 4 per cent, but here, with the best security, the banks charge 1 per cent. above bank rate which is fixed by the Bank of Bengal, and mostly we have to pay 7 or 8 and now 9 per cent. for money. This has been a great drawback to us, the heavy interest on our industry, the profits of which are very small.

(Witness did not give oral evidence).

WITNESS No. 104.

Mr. W. R. Cripser.

MR. W. R. CRIPSER, A.R.S.M., F.I.C., *Messrs. D. Waldie & Co., Chemical Manufacturers, Konnagar, Hooghly.*

WRITTEN EVIDENCE.

Q. 1.—I have not had much experience in raising outside capital for industrial enterprises. Capital.

Q. 2.—I have found that, if I took up the bulk of the share capital myself in any enterprise, others would come in. It is, in fact, a question of personal responsibility and confidence in starting new industries. I am not aware of any particular sources from which capital can be obtained, but the investing public, both Indian and European, will come in if they consider the enterprise is stable and of sufficient attraction. Small enterprises appear to be easily financed by Indian capitalists especially recently in Bengal since the Swadeshi movement gained strength.

Q. 4.—The financial aid which my firm has had from Government so far has been a Financial assist- small sum to help in some research work at Cawnpore. anced.

Q. 5.—As regards Government aid in general for new enterprises, I am not in favour of direct aid but of indirect assistance as specified in answer to *Q. 56.*

Pioneer factories.

Q. 7.—Pioneer factories would be very useful in certain industries of the smaller kind, but I have no experience in any in Bengal:

Financing agencies.

Q. 10.—I am of opinion that more facilities might be afforded by banks in connection with advances on mortgage to new industrial enterprises if the Government guaranteed the whole or part of the mortgage—the Government action to be guided by the advice of the Board of the Industrial Bureau (See Q. 56.)

Technical aid.

Q. 15.—I have had no experience of technical or scientific aid provided by Government, and am not able to suggest under what special conditions the loan of Government experts should be made to private firms or companies. I would, however, suggest that the condition should be determined by the Directors of Industries in each special case.

Q. 20.—As regards demonstration factories, my remarks under Q. 7 apply.

Surveys for industrial purposes.

Q. 25.—I am of opinion that further surveys should be made of the available resources of the country, especially in regard to mineral and forest products. The surveys could be organised in connection with the present Government staff of the Geological Survey and Forest Departments. The object should be the investigation of products of horticultural interest and further investigation of the mineralogical possibilities of the country.

Commercial museums and sales agencies.

Qs. 28 to 32.—As regards commercial museums and sales agencies, I am of opinion that larger industries should do their own advertising as they find necessary. As regards minor and unorganised cottage or village industries, I am of opinion that the style of emporium for the sale as well as display of the products should be carried out in a similar manner to the "Village Industries," Cawnpore, as instituted by the Director of Industries, United Provinces.

For larger industries a directory or list, small and concise, of names of producers and the articles they produce would be advisable in English and two vernacular languages. One should be issued for each province, be easily available at a low cost, and be confined to actual producers in this country and not to retailers of imports.

Training of labour and supervision.

Qs. 44 and 45.—I am not acquainted with any arrangements to improve the efficiency of labourers, but in connection with the staff of industrial enterprises analysts play an important part. The Indian youth of good caste is adapted for routine analytical work, when available, and I would therefore suggest some intermediate laboratory training whereby a further year's practice in analysis might be obtained by students of the B. Sc. course. Special scholarships might be arranged in connection with this.

Qs. 56 to 66.—As regards the future development of industries in India, I suggest—

- (1) The appointment of a Director of Industries for each province. The Director should be a business man.
- (2) The formation of an Imperial Bureau of Industrial Research, with the necessary laboratories attached under the control of a Board.

Official organization.

The Board should consist of not less than—

- Two business men preferably connected with manufacturing industries.
- One engineer.
- One chemist.
- One legal adviser.

All the Directors of Industries *ex-officio*.

The laboratories should be chemical, engineering and general-investigating,—each appropriately fitted, and under charge of qualified men. The laboratories should be in a moderate climate,—possibly Dehra Dun would be a suitable place.

All applications for industrial help should be submitted to the Board through the Directors of Industries of the provinces.

The Board would then decide whether the application was of sufficient importance to warrant investigation in the laboratories.

The Board should also have power to grant the financial assistance necessary for the research, *i.e.*, any special plant or machinery, to carry out the original experiments on a laboratory scale.

The pronouncement of the Board would have the effect of inspiring confidence in possible investors.

A bulletin of the work of the research laboratories should be published.

If considered advisable by the Board any particular research may be regarded as confidential if paid for by the individual requiring the research to be conducted.

In case the suggested industrial proposition could not be dealt with in the laboratories it should be referred to a manufacturing or other concern capable of dealing with it which should be paid a fee for the investigation.

Q. 91.—I am of opinion that a Food and Drugs Act is necessary in this country, especially at the chief ports and inland towns.

Drugs of any quality can be imported and, if with the original labels on, are accepted as of standard quality in the bazars.

As regards food, thousands of gallons of refined paraffin oil were formerly imported monthly, for mixing with ghee, edible oils, and castor oil.

ORAL EVIDENCE, 5TH DECEMBER 1916.

President.—Q I should like you to develop this idea of yours of having a Board of Industries. The idea as stated here is a little new to us. We have had certain other proposals put before us. You want to form an Imperial Bureau of Industrial Research with the necessary laboratories attached under the control of the Board. In that case you would have associated together, subjects that are different in character, such as chemistry, engineering, economic botany and entomology?—A. Yes.

Q. Another idea that has been put before us is slightly different. It has been suggested that we should have for these large subjects separate Imperial departments, each with a head, just as the Geological Survey is organised. The head of the department would be the chief adviser to the Government of India. He may or may not have direct control over all the officers of his department. He might be like the Inspector-General of Forests, purely advisory, responsible for the working plans and in general control of the policy, but not all the officers, who would be distributed for the benefit of the different Local Governments or for other departments. For instance it has been suggested in chemistry that we might have a Chief Chemist to the Government of India, and under him three Deputy Chemists one for organic chemistry, including vegetable dyes, alcohol, and so forth, and another Deputy Chemist would be responsible for mineral and metallurgical chemistry, while the third Deputy would be the Chief Agricultural Chemist to the Government of India, responsible for all the research work in agricultural chemistry. A similar arrangement might be made for botany and for zoology. With regard to the location of the chief offices and laboratories, there are certain vested interests that cannot easily be broken up or overlooked. The Chief scientific officers may not be in the same institution or in the same town, but it might be possible to get the heads of the departments into touch with one another by modification of the present Board of Scientific Advice. Would a scheme of that kind suit you just as well as having a Central Imperial Bureau of Research where you have botanists, engineers and chemists all associated with one another?—A. I suggested this simply with a view to do the things on a cheaper scale, as cheaply as possible.

Q. So that you have not thought of this other scheme? A. No.

Q. You think that your scheme would be relatively inexpensive?—A. Yes.

Q. The controlling board of honorary advisers would include two businessmen, one engineer, one chemist and one legal adviser?—A. Yes, if one man were placed at the head of a number of laboratories he could not have expert knowledge of all the departments. Therefore he must be assisted by advice.

Q. But possibly it might be practicable to have an advisory board assisting the head of each of these big scientific departments. For instance the Director of Geological Survey has nobody to interfere with him. It might be useful for him to be associated with a small board of honorary advisers who would give him some idea as to how the Geological Survey work can be best developed in the interests of the country. The same thing might apply to the botanical man, the zoological heads and the chief chemist. Do you think that would be feasible?—A. An Imperial Department would be much better. I was not regarding this as an Imperial Department but more as a sort of business proposition. I do not propose that this idea of an Imperial Department should interfere with any Government department. It would be quite a separate thing altogether.

Mr. C. E. Low.—Q. How often do you suppose this board would be likely to meet?—A. I thought they would meet quarterly or whenever a sufficiently important question were brought before them.

Q. Would it be possible for the directors to come from distances such as Madras and the Punjab?—A. One of the Directors of Industries said that they should meet together sometimes.

Q. Perhaps you refer to an annual meeting like that of the Co-operative Credit Registrars or the agricultural department. The Board of Agriculture meets once a year or once in two years to put their ideas together. They discuss their programme of work. That is the most important feature. Don't you think that it would be a tax on time?—A. That is so. Then the meetings might be held every six months or the papers might be sent to each member to vote on the proposals.

Sir D. J. Tata.—Q. In answer to question 25 you say that further surveys should be made of the available resources of the country. Some surveys are being made at present. How would you propose that their results should be made available? Are the surveys to be published in the Government gazettes? Is that the only way of disseminating information to the general public?—A. In this particular instance I was thinking only of special surveys.

Q. How would you make that available to the general public? By bulletins?—A. By bulletins or by records like those of the Geological Survey.

Q. Do you think people will make practical use of these things?—A. There is one case in point, which I may mention. And that is the examination of the reba soils. This has been undertaken by the Geological Department. That would be a thing for further examination.

Q. About the efficiency of labour, you say that Indian youths are used to make routine analytical work? Have you yourself employed them in any of your works?—A. We constantly

have one or more B. Sc.s. We have to pay Rs. 50 a month, and we have to educate them. Otherwise they plead poverty.

Q. Do you find their services useful?—A. Yes, after about twelve months.

Q. You have to develop them further?—A. That should be distinctly done if chemical industries are to go ahead. We must be able to have cheap analytical help.

Q. Do you find the B. Sc. or the I. Sc. or the man who has never been to any University better?—A. I cannot answer that question. I have not got any experience of the latter.

Q. When they come out of the colleges they have no practical training?—A. That is the thing. After training they get on well.

Hon'ble Sir R. N. Mookerjee.—Q. In paragraph 2 you say that you are opposed to any Government help financially?—A. I say direct help.

Q. Do you prefer that the bank should advance money and that Government should guarantee?—A. It seems to me a good idea that Government help for small industries should take the form of collateral securities with the banks.

Q. Would that not be more risky than if the Government simply guaranteed interest?—A. Yes. You cannot expect the Government to interfere directly. What I propose is that the bank should make the advances but the bank should be protected by the Government.

President.—Q. Instead of founding an industrial bank you apparently want to have the existing banks guaranteed to such an extent that they would safely indulge in advances made to industries which they cannot do at present?—A. I mean the advances made on mortgage of block to industries.

Q. You really are introducing the idea of an industrial bank, only partially, instead of starting with a new bank to promote industrial enterprises?—A. In my opinion the banking facilities in India are quite sufficient. If they are only protected they could help.

Q. I should like to know your views on a Food and Drugs Act. Before we can do anything in the way of legislation we must be sure that the necessity is real. In the matter of drugs for instance do you think that there is any serious abuse of the label at present?—A. It is all label business in the bazar. Anything can be imported and if it has the original label it is accepted as correct.

Q. And is that going on to any great extent?—A. I think so.

Q. To the extent that it affects the health and wealth of the people?—Q. It may do so, because they prefer to pay as little as possible for medicine. I was referring chiefly to foreign imported medicines. It does not refer to patent medicines.

Q. You think that the people who are the principal consumers are not able to distinguish or readily to obtain reliable opinions as to the quality of the food. Do you think they require protection?—A. I think so.

Sir D. J. Tata.—Q. I do not quite understand what you mean by the affixing of labels to bottles?—A. I simply mean that if any small manufacturer chooses to put an English label and send it out here that is taken as sufficient for the bazar and they believe that it must be absolutely genuine.

President.—Q. Would you like to make any supplementary statement?—A. I should like to mention one item in connection with the Forest Department. It would be a good idea if they would start the distillation of the wood industry in a place like the Sandarbans as a pioneer industry if private individuals are not likely to do it.

Q. Have you referred the matter to the Forest Department?—A. No.

Q. In a case of this kind where a department exists with an organisation to carry out suggestions of the kind it might be sufficient if you send the suggestion to the Department straight?—A. I will make that suggestion and see what happens.

Q. If it is not practicable for the Forest Department to help, it would be our business to advise Government to provide them with the kind of organisation necessary.

WITNESS NO. 105.

Mr. W. T. Grice.

MR. W. T. GRICE, C.I.E., Messrs. Smith, Stanistreet & Co., Chemists, Calcutta.

WRITTEN EVIDENCE.

Government assistance.

Q. 5.—I think Government should do all in its power to assist new industries. Different industries must require assistance in varying forms, for example, where continual experimental work is necessary to work out what are practically secret processes, as in the chemical industry, firms would probably do sufficient experimental work at their own cost to ascertain the possibility of success. Any assistance then furnished by Government might be—

(a) Grant of money to cover the erection and possible dismantling and subsequent re-erection of plant for working on commercial lines until the most suitable forms of plant have been discovered.

(b) The supply of plant on the hire purchase system.

(c) If the products manufactured were such as are required in any quantity by Government Departments a guaranteed purchase at a fair price of a portion or all the factory output for Government requirements for a sufficient period as might enable the industry to get in touch with the various markets.

Q. 17.—Where the industry is of importance to Government, expert assistance, if available, should be placed at the disposal of that industry. If the result is satisfactory the concern should be debited with the cost of his services. Technical aid.

Q. 18.—If the Government paid expert were assisting a private business I should allow no publicity. Government could arrange to have first call upon the finished output if they required it, otherwise the private business would cease to be private, and competitors in business would be made wise on the particular subject without the worry of experiment, or the waste of time or money beside which foreign firms would largely benefit. I understand in this connection that the "Indian Trade Journal," before the war, had as large a circulation in foreign countries as in India or in England. Where the industry was of the nature of a cottage industry or where a large number of persons would be interested all possible publicity should be given.

Q. 25.—Agricultural, forest and mineral surveys should be further extended, and Surveys for indus- should be run in connection with a Department of Industry. Requirements in raw material trial purposes. for any industry should be tabulated by the department so that the survey could open up its enquiries on specific lines, the results to be communicated to the industry interested either direct or through the Secretary of the Chambers of Commerce or Trades Associations. My firm has repeatedly been asked to obtain small quantities (1 or 2 tons) of forest produce for experimental work, and have known that a regular demand would follow if the experiment proved successful. This applies to medicinal requirements for leaves, roots and oil-yielding seeds growing in Indian forests. The officers of the Forest Department will usually give us all the information they have regarding these, but will not undertake collection for us, nor, as a rule, can they recommend a reliable collector. In short they do not want to be bothered with small items, naturally. We have no staff to send to collect, and it would not pay to send a trained man to collect small quantities (1 or 20 tons) of such forest produce possibly to the Himalayas or to Southern India, who might be required at many different points simultaneously hundreds of miles apart. Thus possible sources of profit to the Forest Department are left untapped. It should be possible for the Forest Department to carry out the survey of medicinal plants growing in their forest, and to arrange for collection when required. They are familiar with local labour and conditions, time of collection, etc., and could do this with very small expenditure or trouble. When such a survey was completed the available information would enable the department to state with some precision what quantity was available, nearest port of shipment, and approximate cost of collection in each district.

Q. 34.—Trade representatives should be appointed in Great Britain, the Colonies and Trade representa- foreign countries, furthermore our Consuls in foreign countries should act like the Consuls of tives. other countries, viz., America, Japan and pre-war Germans, who called upon industrial concerns, made a list of their requirements, which were sent to their respective countries, and resulted in many letters from the manufacturers in these countries and subsequent business relations. This matter requires placing upon a systematic basis.

Q. 37.—Government Departments should publish lists of their requirements, and have an Government easily accessible exhibit. Practically every firm on the India Office list has an agent in each patronage. of the three large cities of India. Local storekeepers would get exactly the same terms for requirements purchased through these agents, would get their goods quicker, and could explain their special requirements more easily. Stocks would be kept by local agents, and the whole Government purchasing put upon a business basis. Storekeepers, in my opinion, should be business trained men, and not army officers, medical men, or civilians.

Q. 40.—Raw material, such as forest produce, should be strictly controlled. I have on Supply of Govern- several occasions arranged for the whole output from certain districts to be sold to me, but only ment owned raw limited quantities have reached me consequent upon peculation and bribery which has un- materials. doubtedly affected collection. Leakage has been known to occur though practically impossible to trace.

Q. 44.—Skilled labour in my business is very essential. I have, with the exception of Training of the analysts, had to train my own labour. We take apprentices in all departments, but find labour. that school trained men are not sufficiently practical to be of use without much supplementary training.

Qs. 89, 91 and 93.—There should be a Food and Drugs Act, and all misdescription of Certificates of goods and adulteration could be dealt with under this Act. quality, etc.

Q. 97.—Rail freight, to my knowledge, is at present interfering with several industries, Railway freights. which otherwise might be worked at a profit. Government could possibly arrange subsidised rates to deal with these industries.

Shipping companies also do not assist small local industries.

My firm is interested in the manufacture of thymol in India from Indian raw material. We are shipping this to England to compete with the preparation made in England from Spanish raw material.

In October last we shipped at 185 shillings per ton of 50 cubic feet. This rate we did not consider unreasonable under present conditions as it represented 1531 annas per pound.

In November we applied to two shipping firms for freight for another consignment of the same article when we were quoted respectively 3 per cent. and 4 per cent. *ad valorem*, the enhanced rate being charged because it was valuable cargo. This works out at 9.72 and 12.96 annas per lb. respectively, while parcels post will deliver at the door at 3.27 annas per lb. Incidentally I might mention that we receive from England, practically by every liner, cargo equally valuable, *e.g.*, quinine, etc., on which we pay exactly the same freight as other drugs, so that the "valuable cargo" reason is purely a local idea, as no special care is taken of such shipments over other cargo. Thus the new industry would be penalized unnecessarily to the extent of over 1 shilling per lb.

ORAL EVIDENCE, 5TH DECEMBER 1916.

President.—*Q.* Do you wish your evidence to be recorded as confidential?—*A.* I wish several of my remarks to be regarded as confidential.

Hon'ble Sir P. H. Stewart.—*Q.* With reference to the difficulties of freight do you think that they affect you seriously?—*A.* Absolutely.

Q. You cannot owing to these compete with the preparations made in England?—*A.* It is penalising us to such an extent that makes trading from here almost impossible.

Q. How is this thymol packed?—*A.* It is packed in tin-lined cases with wood an inch thick.

Q. You know that the rates of freight on everything have gone up very greatly?—*A.* Almost everything we get out and many of the heavy chemicals are very high priced. They come out at measurement rates. The shipping companies do not take any special care. I therefore think that we should be charged in the ordinary way.

Q. The steamer people do not take particular care?—*A.* I do not think so. We pack the cargo securely.

Q. Do they stow it near the engines?—*A.* They are not asked to. Thymol should be stowed away from the engines as it is very volatile.

Q. If you do not mind I should like to have a note showing how these rates are interfering with the industry that you are working up?—*A.* I will see you on the subject.

President.—*Q.* You complain about the Forest Department not being able to supply you with quantities of raw material when you wished to develop medicinal plants. When you made a request of that kind did you assure them that you are a purchaser on a large scale or did you merely send for samples?—*A.* We have written to the forest officer of the Division and said that we wanted to get a certain quantity whatever it may be. We have asked frequently not, in Bengal particularly, but also in the higher ranges. We have asked them to recommend a respectable man to collect because it is naturally impossible for us to send a man, say, to Kashmir to collect 10 tons of any special root. The invariable reply has been that they could not assist in that way at all. My idea is that if the Forest Department was properly organised the Department could with very little expenditure of time and trouble collect the details that would be available to any industry. I am speaking of my own industry particularly. The forest officer knows how a plant is distributed in the district.

Q. Have you made many requests and have they been all unsuccessful?—*A.* I have made many requests and practically in every case we have been unsuccessful.

Q. Have you communicated with the Provincial Conservator of Forests or have you applied to the Forest Economist?—*A.* To the Conservator direct in some instances and to the provincial men whatever their rank may be in the different districts. For instance if I know that a certain root is available in a certain district I have asked the man in charge of the district to help me. They have always been most courteous and helpful in locating the spot as far as the book work is concerned.

Q. Have you never applied to the Forest Economist?—*A.* I cannot say I have. The difficulty is to find out the correct channel of communication sometimes.

Q. One has to remember that so far very little has been done in the way of developing drugs from the forest raw material, partly because you people have been making it so easy by getting the things from home. This is a recent development?—*A.* We have been trying for the last five or ten years to do as much as we can in the way of developing forest produce.

Q. You say that Government Departments should publish lists of their requirements and have an easily accessible exhibit?—*A.* Practically every firm on the India Office list has an agent in each of the three large cities of India. Local store keepers would get exactly the same terms for requirements purchased through these agents, would get their goods quicker and could explain their special requirements more easily. Stocks would be kept by local agents and the whole Government purchasing put upon a business basis.

Q. I suppose that you recognise that there is risk of abuse when junior officers have permission to purchase their own stores. Each officer has to purchase a large variety of stores, in fact a larger variety than he could be expected to have intimate knowledge of. Do you not think it would be better if we had in India a sort of stores purchasing department

similar to that at the India Office so that when the requests come in from the Local Governments or local officers these could all be amalgamated and the Central Purchasing Department will then be in a position to obtain contract rates and even to issue forward contracts. They would also have a staff to check the quality of the purchases. Do you think a system of that kind would be better than leaving the local officers to make their own purchases?—A. The point I want to make is that if you had a business man running it, the possibility of juniors having commissions and things of that kind would be considerably minimised. In many cases the purchasing power now is left by the Bara Sahib in the hands of his junior. That is why I have said that the store keepers should be practical business men. I have known many instances and could give them if necessary. If a head of a department were buying the requirements for that department regularly he would know enough about it and the firm which has got a reputation and the future business to look to, would not kill the goose that laid the egg.

Q. There is another difficulty: an isolated officer does not want to take the responsibility of purchasing certain things that he has no personal knowledge of. Still another difficulty is the frequent changes that occur in officers. You get a man who has a special liking for one kind of thing and another man comes in who wants a totally different thing?—A. That is quite so.

Q. Do you think then that a Central Purchasing Department would be useful?—A. I think it would be useful.

Mr. C. E. Low.—Q. You speak of the difficulty in getting the Forest Department to contract and the inability to make reasonable terms with the contractor. It has been suggested that the Forest Department should have a commercial side which would have two men for the larger provinces and one for the smaller provinces. He would have some knowledge of forest work and also have some commercial training. Do you think that would assist?—A. I think it would very considerably.

Q. Do you think that the establishment of such a commercial branch would be a benefit to industries in India and also indirectly serve the interest of Government?—A. Undoubtedly. I have had several instances brought to me. I had sent to me by Mr. Pearson a couple of gallons of oil from oil yielding seeds for soap making. I was then director of a soap company. The oil was suitable. I asked for particulars how it could be handled on a large scale. I was ready to place an order for large quantity. I was informed that there was only a limited quantity available and after that I could not get any other particulars about it. That is a case in question. The Forest Department could have made much money practically speaking.

Q. With reference to your Indian employés in what capacity have you tried them?—A. I have tried them in every capacity. I have got analysts in my laboratory from the University and I have got the indigenous compounder class from the Campbell Medical school. I have got all grades of men.

Q. What sort of work can you get out of the University men?—A. They are very slow. They require training. They come with theoretical knowledge and we teach them to apply it.

Q. How long does it take to get the men up to the proper standard?—A. In twelve months' time they begin to be useful.

Q. Do they stay with you?—A. We have had men for a considerable number of years.

Q. What sort of pay do they get?—A. They get Rs. 100 a month. Some are getting Rs. 150, 175 and so on.

Q. What kind of work do you put them on?—A. General analytical work. I have got two European analysts. The Indian employés work under them.

Q. In answer to question 111, you say that you have some confidential information about certain new industries for India?—A. One of the things I have in mind is starch. I wanted to start a starch factory myself because there was such a great demand for it in the jute mills and in the cotton mills. But I was not able to get the money that was wanted for the purpose. Then of course the war intervened and I have not interested myself very much since. That seems to be an industry that may be pioneered by Government because the material has hitherto come from Germany. We can as well do it here and it is practicable.

Q. You also think that there is no private individual who will take it up?—A. If some one had had the money at his disposal possibly it would have come into being some three or four years ago. My own figures point out that it is quite practicable to do it.

Q. Do you know what they have done at Pusa?—A. No. I read the publications of the Geological Survey.

Q. You mean the trade journals?—A. I heard that the trade journals are turned to very good account in Germany and on the Continent and that they had a larger circulation in Germany and on the Continent than in India and England.

Witness here gave confidential evidence.

President.—Q. Do you get the Geological Survey publications? Are you a permanent subscriber?—A. Yes. I think the other journals want systematising in the same way.

Q. Do you undertake analysis for various people?—A. Yes.

Q. Do you think it would be fair or practicable to communicate your results to Government confidentially?—A. It would be for the other party to say. I am exactly in the position of lawyer and a client and a doctor and his patient.

Q. There is an enormous number of valuable data that are buried at present?—A. I think that without mentioning particulars of any kind the information could be given to Government without any breach of etiquette.

Sir D. J. Tata.—Q. With reference to your remarks about the B. Sc.s, do you mean to say that they have no originality and that they do only the routine work?—A. I do not say that. The men come to me with a certain amount of book learning and they want to have some practical training.

Q. Do you think they come there only for the purpose of earning their livelihood, without any idea of improving themselves with a view to do original work?—A. I am afraid that is so.

Q. You find that they simply carry out the routine work without attempting to invent processes? Is that the feeling of the average student?—A. They want their practical side developed. They can learn anything.

President.—Q. Can you tell us whether the manufacture of starch or caffeine was suggested by any of the Indian students? Have they ever suggested to you any such new development?—A. No.

Hon'ble Pandit M. M. Malaviya.—Q. Have you heard of Dr. Harischandra of the Berlin University at Dehra Dun who has manufactured farina?—A. No. But I know that several people have made it.

Hon'ble Sir F. H. Stewart.—Q. In answer to question 25 you refer to speculation in minor forest produce. Where are these?—A. They are in the district where the produce is collected.

Q. Are you not sufficiently far advanced and strong enough to collect your own requirements?—A. The point is it is so very difficult, because you have only a small quantity of produce from one particular district. It means a very big area.

Q. The Forest Department should be so developed on the commercial side that they would give information and execute orders?—A. They would also see that the forests were not robbed as they are at present. I had the collecting rights and I got only two-thirds of the yield. The rest was taken away by people who were on the spot and could bribe the forest officials.

Q. With regard to question 97, could you mention any particular industries which are hampered by railway freight?—A. I might mention citric acid. When it went up to 5 shillings a pound I conceived the idea of making it from limes. But when it came to practical politics I found that freight would cost 15 as compared with the Italian price of 5, I mean other things being equal. It struck me that possibly if I had approached Government and said that this industry needed underwriting something might have been done.

Q. Cannot you start the business where the limes are?—A. It is too complicated to manufacture there. One might make the preliminary tests there.

Q. What is the respective lead between the Italian and the Indian factory?—A. The factory and the garden in Italy are close to one another. I mean granting that the fruits give the same yield I am penalised by distance.

Mr. C. E. Low.—Q. You are aware that the Agricultural Departments are tackling this question with a view to find out more suitable areas for fruit-growing and to concentrate the growing in order to make arrangements for marketing and so on more easy? Have you put yourself in communication with them?—A. If I had been really going into the question I should have done so. I had not much time to think of the subject. I put the point as it came readily to my mind.

President.—Q. Do you think that a Food and Drugs Act is necessary?—A. I think there is very great need for it.

Q. Do you mean to say that the honest firm is handicapped?—A. Yes; I have seen an order sent home for sweet spirits of nitre, the order stating that the spirit strength should not exceed 28 underproof. If sweet nitre were made with underproof spirit it could not contain the percentage of ethyl nitrite it should contain. Consequently the Doctor who prescribes it loses his reputation, the patient his cure and Government loses about Re. 1 per lb. on the duty as the correct strength should be 58 overproof at the present time, any bottle which has a European or American label is taken to contain what the label says it has and this is frequently false.

Q. Where do these things come from?—A. From Germany, England and America and they are made in this country. I have seen them made locally. If there were a Food and Drugs Act they could be penalised. I have known three cases that went to the Police. In one case the man was fined Rs. 100.

Q. That did not hurt him much?—A. He got it out of the first batch of stuff that he sold. This is one of the great needs of the province from a health-point of view and I would like to draw the attention of the Commission to the urgency of this necessity.

WITNESS No. 106.

MR. A. F. C. FORBES, *Messrs. A. Forbes & Co., General Merchants & Agents, Calcutta.*

WRITTEN EVIDENCE.

Generally speaking, I do not favour the principle of Government assistance as it calls into being enterprises of unsound foundation. Any of the existing banks in India will start financing a new concern which is really sound and has some capital of its own to commence with. Only where the aid of a bank, for reasons other than unfavourable to the new venture, be unobtainable would I suggest Government help in the shape of loans with interest. A concern which cannot pay a moderate rate of interest for accommodation is better advised not to start at all.

Government assistance.

I consider commercial museums most valuable, and not less so exhibitions which should be popular in character having besides as object the bringing together of buyers and sellers.

Commercial museums and exhibitions.

I think that lists of articles used by Government departments should be regularly published in the commercial museums and the articles be exhibited if at all possible.

Government patronage.

I consider registration of partnerships very necessary, declaring, apart from the name or names of partners, their nationality. It should be made impossible for minors to figure as partners.

Registration of partnerships.

ORAL EVIDENCE, 5th DECEMBER 1916.

President.—Q. You sent in a short note to us and have told us that you think the commercial museum would be valuable for exhibiting the articles that Government departments are now using. Do you think it would meet your case if once a year the Government issued a report giving a list of the articles purchased in the past year, together with—as far as possible—the prices paid?—A. I think it would.

Q. You recognise that it is very difficult to exhibit these articles in commercial museums, as there would be changes made so frequently that it would necessitate heavy expense?—A. It would.

Q. What difficulties have you found with regard to the want of regulation as to registration of partnerships?—A. I have never personally found any difficulties, only that it did not exist especially in former times. When I first came out here the practice obtained that in dealing with native firms, sometimes, if you wanted to go for the man he said, "I am not the responsible partner." This is what my remarks refer to. If that still obtains to-day I cannot say. That goes back very far.

Mr. C. E. Low.—Q. Do you remember some two or three years ago Government actually prepared a list of stores they obtained on indent from England, but very little use was made of it. It took a very long time to compile, it came out very late, and by the time it was out, the prices were entirely out of date?—A. I remember that.

Q. It was a very bulky document, gave a great deal of labour in compiling, and I think it would have been very difficult to get it out any quicker unless you had a special organisation for that purpose. Do you think it would be worth such special organisation?—A. I really don't think it would have any true practical value unless such prices were kept up by a body of merchants and constantly renewed, so that when a man asks "I want the price of a given article" to be able to put my finger on a given firm who would give me the very latest quotation. That would mean enormous organisation. The value is lost, because the true value of a price or quotation is immediate knowledge after it has been established in the market.

Q. Do you think it would be possible to do anything in a selective way, with the help of a committee of business men?—A. In that respect the nearest thing I know of, and really useful, is the Chamber of Commerce Price Current. Anything like that is of real use.

Q. Are you interested in the hide business here?—A. Yes.

Q. Before the war the path of those hides was mostly in the direction of Hamburg and Bremen?—A. Yes, Germany and Austria. The two ports you mention were the ports of distribution.

Q. Both you and the German users were very largely under the control of the Hamburg and Bremen ring?—A. I don't think it was a ring so much as that these Hamburg and Bremen merchants practically held the monopoly. They were very large dealers and bought hides and sold them to tanning industries.

Q. I now understand that it is your desire that other British firms in Calcutta should substitute for that previous German connection either British connection or local manufacture?—A. The idea is that that business is to be kept in British hands as far as possible.

Q. From a purely business point of view, which is the most promising business, to get the hides bought and dealt with in England, or made into the finished article in India?—A. I would say both. Let India take first whatever she wants. Support that as much as possible, and let the surplus go out of the country.

Q. Which do you think is the most promising, speaking from the purely commercial point of view?—A. I would say, of course, commercially, if you only think of the merchants, they would say, "I would sooner have the export trade supported and fostered." The merchant does not think of the other people.

Q. That is because he has always been in the export trade, but some tanners are also considering the question of local tanning?—A. The local tanners naturally would not come to us for hides; they would do the buying themselves in our local markets.

Q. But you yourselves are thinking of local manufacture?—A. I am not interested in any local manufacture, neither prospective nor actual. I did not know that idea had started.

Q. Are you in a position to say with any confidence whether it is a feasible proposition, a local tannery on a large scale?—A. I think so if the men who undertake it are really practical men. Since I have been in India—I speak of Calcutta chiefly—there have been two or three attempts which have failed because they never had practical men to do the work, and you were generally in the hands of men who either took to drink or who did not know their work well enough, and so the thing failed.

Q. Do you think there would be the capital forthcoming for a scheme of that sort?—A. Yes, I should say so.

Q. Do you agree with this presentment of the reasons why hides went to Germany before the war. It has been put to us that the British firms—the tanning firms—concentrated themselves more and more on heavy hides and certain high classes of tanning work; the trade in these lighter hides, because it was neglected by England, began going to Germany in large quantities. There was an understanding between the dealers in Hamburg and Bremen that they would oust any German tanner who bought otherwise than through them, and would refuse to deal with any Calcutta exporter who sold in any wise but through them?—A. Yes, that state of affairs existed. The Hamburg and Bremen importers stated that they were so overrun with offers and new marks from several firms with German interests. Of course the hide export business had increased considerably. Then these men said, "if you will only work through us and chiefly support us who are the distributors, we will not push any new marks, but will push the old marks."

Q. Is there any truth in the story that a firm here was boycotted by the Hamburg-Bremen people or by Calcutta exporters?—A. By the Hamburg and Bremen people. As far as I know, because at that period I myself was not a shipper in kips. I dropped out of it because the competition got so horrid.

Q. What did you deal in—arsenicated or dry-salted?—A. Now both. In those days my chief business was in buffalo hides and goatskins to America.

Q. Do you deal in Agras or Daccas?—A. Both.

Hon'ble Sir F. H. Stewart.—Q. Is not expert knowledge in the purchase of hides very important, and is it not very difficult to find experts?—A. Yes.

Q. Is there any chance of these experts being forthcoming from England?—A. I should say so. But for the hide business, apart from mere expertness to judge hides, you have to gain your knowledge locally.

Q. For whatever reason, 80 per cent. to 90 per cent. of export hide buyers have been either Germans or German Jews?—A. When I first came out to this country the whole business was in the hands of Germans or German Jews. Those were the only people who would handle them. The average Englishman would not. I remember how it shocked me when I heard about hides. I did not fancy it at all and thought it very *infra dig*, but as you have got to do your work in the firm by whom you are engaged, I afterwards had to take that up as part of my work, not only the technical work but the bazar work.

Q. You got all your training out here, both technical and otherwise?—A. Yes.

Q. Does the class of man exist at home to-day who can come out as an expert?—A. He would have to learn local ways of buying, because hides here are bought all round. The men, up-country, bring them down, and bring everything, good, bad or indifferent in one bundle. Then you as an expert—you have got your assorters for it—sub-divide that bundle into certain selections. You know from your prices which you get in Europe or America what these individual selections are worth. You make your calculation and then you say, "I give you for this all round so much." You either get the bundle or you don't.

Mr. C. E. Low.—Q. Selections vary in different firms?—A. Yes, but not very much. It is not very much larger than in the jute trade.

Hon'ble Sir F. H. Stewart.—Q. Purchases are made in the open market, not by a system of contract or guarantee?—A. You buy all round in the open market.

Q. How long would it take for a man to pick up the necessary local knowledge?—A. Very quick. Say you engage at home a young tanner, or someone who had been in one of the big brokering firms at home, he would very soon find his way.

Q. If he came out and put his back into it, he would know his way round in a year?—A. Yes.

Dr. E. Hapkinson.—Q. There are other markets in hides besides Germany and the United Kingdom?—A. America is one, Italy, Spain, Scandinavia. The largest consumers of our hides were always Germany and Austria; next came Italy, next Spain and Scandinavia. England

always took something, but England dropped back after the Franco-German War. Before that time England used to supply the Continent with leather. After the Franco-German War, German competition combined with the Madras tanneries, drove our British tanners more or less out of the trade. Kips formerly were tanned only by Yorkshire and Lancashire tanners.

Q. Are you attempting to develop business in all these countries, or especially in the United Kingdom?—A. In all. I am trying to take up my old connection with England also.

Q. Because other countries have failed?—A. Yes, with other countries the kip's trade is quite an established one. It was so also with England, but the English tanner was driven out of it through sheer competition, and of course non-protection.

Q. Do you buy and collect in the mofussil?—A. I have a firm in Cawnpore and one in Dacca who buy for me. I don't collect in the mofussil; that is really the biparies' work.

Q. You buy in central places like Cawnpore?—A. Yes, and Dacca; chiefly in the Calcutta market.

Q. You sort and select here?—A. What we buy we buy all round, and divide everything up in our godowns, first in respect to quality, then weight; and then we ship.

Q. Are hides sold according to marks in London?—A. They are sold according to shipping marks and especially with reference to under marks or quality marks of the goods. To give an example. I have got a bunch of hides here (indicates on the table). This I call top selection "A," this is "B," this "C" and this "D." All have different values and each has different weights, extra heavy, heavy, medium and light, which again have different values, the sub-selection figures on the bale shipped, and you then get your price for it. This man takes only lights, another man will take the rubbish, i.e., the rejections of a given weight. That is how the trade is done. Since the war a great deal has been done in all-round selling, i.e., I say I have four collections here. Someone says, "I will take those 20,000 hides together." That is quite an innovation and did not exist in pre-war times. When the war is over, people will be more fastidious; they will not buy everything. Some of our customers willingly do it, but only big men can do it.

Q. In normal times the sales are made by auction in London?—A. Hides are sold in London by auction, not here in India. That I don't believe could ever arise, because as I say, hides are sold all round. To value them and sell them by auction would be a very difficult process.

Q. Does the same system obtain in New York or Scandinavian ports?—A. In buying selections?

Q. Yes, and are they sold by auction?—A. The business starts this way. A man sends me an enquiry; I make the man a firm offer; I say I have got 20,000 hides, and I give a rough description of what they contain. Then I say, "This is my price," and the man says "All right, I will take them or will not take them." If he takes them, it is a bargain. If he does not take them, I try and sell them to another man. Before shipment they are selected and baled up and the man gets the bales of hides of different weights, and he keeps them, telling me to draw on his bankers. I sell my bill to the exchange banks here; then I am paid, and this transaction is closed. If I have shipped anything below my standard, I am subject to arbitration in America or England. This customer of mine would say, "You have not shipped quite up to your standard." Two brokers have seen it, your own agent too. They have decided so and so. Then I have erred and have to abide by the award whatever it may be. That is how the business is done.

Q. But I understand you sell in Calcutta?—A. Very rarely; sometimes one firm sells to another; that happens.

Q. Regularly?—A. No, only now and then. What I buy here I sell to Europe or America.

Q. And you pay shipping charges?—A. Yes. To some people I sell c. i. f., to others c. & f. The Americans generally buy c. & f. When the war started they had to buy c. i. f. and war risks, because banks would not take the documents differently. They wanted complete collateral security. The American buyer arranges for insurance and war risk. To Italy and London we sell c. i. f. and war risk.

Q. You have no difficulty in getting whatever banking facilities you require?—A. Not in the least.

Q. From the exchange banks?—A. The exchange banks take our drafts or bills. All the business is financed through London bankers.

Q. Do you find that the business requires a considerable amount of capital?—A. It does. You cannot do a hide business on a small capital, because you lock up a great deal of money. For instance it would be of no use for a man to attempt the hide business who could only say "My capital is half a lakh of rupees." He could not move; he must have several lakhs. Having that, the banks would assist him further. Banks are very good here.

Q. Would you say that command of ample capital was one reason of the German success?—A. No, because what a German could do, as far as capital is concerned, any Englishman could do. No, their success was due to the fact that they took up, in the early days, a line of business which the average Englishman would not touch, and turned up his nose at.

Q. However, you do not see any reason at all why the whole business should not pass into British or Indian hands?—A. I see no reason, if they apply themselves to it. There is no

reason whatever why British firms should not get hold of a big slice of the business. I am speaking now of shipments to foreign countries, excluding Germany and Austria.

Mr. A. Chatterton.—Q. Can you tell me what becomes of the skins that are available in the same areas as the hides are drawn from which are brought to Calcutta?—A. Yes, more or less; wherever the hides come from the skins are also collected.

Q. Do they come down to Calcutta?—A. A good many, not all. Everything comes to Calcutta from Eastern Bengal, Orissa and part of Central India. Those collections are sent to this market; also from Darbhanga, Muzaffarpur, Bihar, etc.

Q. From the more Northern districts do they go down to Madras and Bombay?—A. From the Northern district they go to Karachi. From Cawnpore, in the United Provinces, the skins are either sent to Calcutta or shipped *via* Bombay, according to the freight. The freight determines that.

Q. Is there any pickling done in Calcutta now?—A. Not what Madras calls pickled. There are two classes of skins, dry-salted and wet-salted. Wet-salted are the green skins salted with table and khari salt and then shipped. Pickle is some chemical substance, whitish in colour was used a great deal in Madras and was called the pickled skin.

Q. Pickling is not done at all here?—A. Not here.

Mr. C. E. Low.—Q. Have you had any experience of the up-country slaughter market trade, as in Agra and other places?—A. No, I have not been there. I have been in Cawnpore buying hides in the open bazar.

You speak of buying from small firms up-country. As you know in these large slaughter yards there were Germans originally, purchasing the hides from the butchers. Were those men employes of exporting houses in Calcutta, or a separate organisation?—A. No, there were branches of Calcutta exporting houses there. Schroeder Smidt & Co. had a big branch in Cawnpore and used to buy largely from slaughter houses up-country.

WITNESS NO. 107.

Mr. J. Goodman.

MR. J. GOODMAN, Messrs. Anderson, Wright & Co., Merchants and Agents, Calcutta.

WRITTEN EVIDENCE.

Silk industry.

The silk industry, which in the days of the East India Company, was one of the most flourishing in Bengal, has gradually declined until it is of very small dimensions as compared with what it used to be. In fact the production of silk in Bengal is now so small that, after the needs of local buyers have been satisfied, there is very little raw silk left over as available for export. Now-a-days even the local buyers do not confine themselves to silk made in India but import considerable quantities from China and Japan.

The Governments of other countries, such as Italy, France, Japan and Hungary have for many years past been spending large sums of money on their respective silk industries, recognizing as they do that the industry is one which requires special help and which is a valuable asset to the country.

The Bengal Department of Agriculture has for some years interested itself in the industry and grants of money have been made by Government with the object of arresting, if possible, the decline of the industry and bringing it back to its former prosperous state, but in my opinion Government should do considerably more than they have been doing in the past.

It is the general opinion of those interested in the industry that this decline is due to two main causes—

- (a) to the prevalence of disease amongst the worms,
- (b) to the fact that, owing to the inherent nature of the indigenous cocoons, Bengal silk is greatly inferior in quality to that produced in Europe, China, Japan and other countries and consequently fetches a much lower price.

As regards (a) the policy of the Department of Agriculture (under the recommendation of the Bengal Silk Committee) has been the establishment of Government nurseries for the supply to the rearers of disease-free silkworm eggs. The Silk Committee were of the opinion that what was wanted was that Government should ultimately establish sufficient nurseries to produce all the eggs necessary for the requirements of the province, so that whenever a rearer wanted eggs he would go to one of the Government nurseries for it. A scheme was drawn up for the establishment of 19 nurseries, and a start was made with building them. But as soon as the European War broke out all the work was stopped and later the Director of Agriculture gave his opinion that instead of proceeding with the nurseries, equally good results would be obtained by distributing eggs produced in the existing nurseries amongst certain selected rearers, who would in their turn rear the worms and sell the resulting eggs to the ordinary rearers. Under this scheme it was intended that the selected rearers should, as far as possible, be under the supervision of the Sericultural branch of the Department of Agriculture, but I am emphatically of the opinion that such a scheme, though good and well intended under normal conditions, can in no way take the place of the original

scheme for the establishment of nurseries directly controlled by Government. I consider it a matter of the greatest importance that the building of the nurseries should be proceeded with as soon as circumstances permit. As stated above, other countries, and more especially Japan, spend large sums of money on the development of their silk industries and if any real good is to be done in Bengal the annual grant for sericulture should be largely increased.

As regards (b) the Government of Bengal in 1912 appointed a French sericultural expert (M. Lafont) to make researches with a view to helping the industry by improving the existing races of silk worms in Bengal by cross-breeding or other methods or by introducing suitable races from other countries. Unfortunately after about a year's service this gentleman's health broke down and he had to return to France. At the end of 1913 another French expert (M. Grangeon) was appointed, but when the war broke out he was recalled by his Government for military service. During the short time that these gentlemen had the opportunity of studying local conditions they both did much good work and made some useful suggestions. Neither of them, however, had time to get beyond the experimental stage, and much remains to be done, more particularly in the direction of testing the ameliorated races on a large scale and under the conditions under which the worms would be reared by the ordinary rearer. I am of opinion that it is highly desirable that M. Grangeon should be re-appointed as soon as his services can be spared, or if he is unable to return that some other expert should be appointed in his place.

At the present time Miss M. L. W. Cleghorn is also conducting extremely useful experiments in cross-breeding at Alipur and I recommend that Government should continue to give her a sufficient annual grant to enable her to carry on her experiments on a proper scale or better still employ her as a Government servant for that purpose.

I would add that I regard the question of the appointment of a properly qualified European expert, as the head of the sericultural operations in Bengal, to be one of extreme importance to the welfare of the industry. I consider that if such an expert had been appointed in 1906, when the appointment was recommended by the Oldham Committee, the industry would probably now be in a much more flourishing condition than it is at present. I believe that M. Grangeon would be an ideal choice for this appointment. Not only is he a sericultural expert, but I believe him also to be a capable organiser; he organised the silk industry in Madagascar, which I understand is now doing very well. The experience which he already has of Bengal is also in his favour. I do not think that more than a short time would be required for him to determine which of the various ameliorated races, with which he was experimenting before he left, are most likely to be successful, and as soon as he had completed those experiments he could go on to the more important work of organising the industry in Bengal as a whole on modern and scientific lines.

ORAL EVIDENCE, 5TH DECEMBER 1916.

Mr. C. E. Low.—Q. Will you kindly explain what is your precise connection with silk in this part of the world?—A. I am a partner in Messrs. Anderson Wright & Co., who are the owners, or rather part owners of the Rose Filature Concern, which at present is the only European concern reeling silk in India. A few years ago there were several European firms in the trade.

Q. Where is your place of manufacture?—A. We have several filatures in different parts of Bengal,—in Murshidabad principally.

Q. How do you purchase your cocoons?—A. The system is that each filature has a number of paikars, a sort of broker, who go round to the different villages and buy from the rearers, from people who rear worms in the villages.

Q. Are these rearers of any particular caste?—A. No. A great number of them are Muhammadans. I do not think there is any particular caste.

Q. Do the paikars give these men any advance?—A. Sometimes they do. The paikar deals with the rearer himself.

Q. You do not see much of the actual rearer himself?—A. Practically nothing. We buy cocoons.

Q. Do these men carry on any other occupation, such as cultivation, in addition to this rearing of cocoons?—A. I think they do in some cases. They are not always entirely devoted to silk-rearing. In Europe where there is only an annual crop the silk industry is a subsidiary industry. They rear that in the spring and during the rest of the year they do other work.

Q. Do you do anything to help these men to get seed?—A. We have tried at different times. For many years we have carried out various experiments of our own in the way of importing seed from Europe.

Q. You purchase cocoons by weight?—A. It is a very complicated system. Cocoons are purchased sometimes by the kahan—number,—and sometimes by the weight system. They weigh a certain number of cocoons and count them. The system of purchasing varies from place to place. In some places they buy by the maund, and in other places by the kahan.

Q. Of course the production is falling off?—A. Enormously.

Q. Are the prices decreasing?—A. The prices at the present moment are higher than they have been for a number of years. I think the cause of the great decline in the industry is

disease first, and secondly, the quality of the silk grown here is inferior. The breed of silk worms reared in this country is much inferior to those of other countries, say, Europe, and Japan. Disease is really at the bottom of the whole thing.

Q. I should like to know whether the disease has got worse and whether the production of better qualities of silk in larger quantities in other places has caused a decline in the demand for Indian silk?—A. The quality of silk produced in other countries is steadily improving. Also pebrine is the great disease among silk worms. The pebrine disease almost wiped out the French industry in the sixties until Pasteur found the great remedy for pebrine. In France pebrine is now absolutely negligible. There is practically no pebrine there. In this country it is dreadful.

Q. With regard to the demand for Indian silk, is the price of Indian silk less than what it used to be?—A. Silk varies so enormously that it is a very difficult question to answer. You will find a complete set of figures given by Mr. Anson. You will find enormous variations. At the time of the great crisis in the silk industry in Europe prices went up very high and that naturally stimulated production here. There was a tremendous demand then for Indian silk. In those days Japan was producing a very small quantity of silk. In 1888 Japan exported 25,000 bales of silk and she is now exporting 200,000 bales of silk. Not only in quantity, but in quality also they have improved. We have remained steady without making any advance at all in quality.

Q. Turning to your specific recommendations you state that the Bengal Silk Committee recommended that ultimately all the seed required for the province should be produced by the Government nurseries?—A. Yes.

Q. Are Government able to produce disease free seed at present?—A. I do not think it is absolutely disease free—I mean free from the pebrine disease. In the silk trade when they talk of disease free seed they mean pebrine free seed.

Q. Is it not the case that the means of securing freedom from pebrine in a seed which are applicable to Europe are not necessarily applicable to this country?—A. That is a question that has very recently been raised by Mr. Hutchinson of Pusa. I may explain to you his reason for that. The Pasteur system is to examine the crushed body of the moth microscopically. The bodies of each pair of male and female moths are kept together—that is what they call the cellular system of selection—and then the body of the moth is crushed and examined. In Europe where they have an annual crop they have ten months to do it at their leisure. Here we have a multivoltine brood. There is very little time between the laying of the eggs and the hatching of the worms to do the examination and Mr. Hutchinson thinks that a pebrinised moth may easily be passed as a disease free moth, and he has suggested a way of getting out of that difficulty. Instead of testing any part of the body of the moth the head of the moth should be pulled off and the intestine drawn out and that part of the moth examined, and that will give a very much better test than the ~~present~~ system.

Q. Who are the people who will do this examination?—A. Men trained by the present superintendent of sericulture. They get very small salaries of Rs. 15, 20 or 25.

Q. Do anybody inspect them?—A. Mr. Ghose is the Superintendent of Sericulture and he has a certain number of people under him who go round and inspect these places, but they are on very small pay.

Q. You say that a scheme was drawn up for the establishment of 19 nurseries. How many nurseries are actually working?—A. Seven at present.

Q. Do they produce seed which is appreciably free from disease?—A. I think, on the whole, it is fairly free from disease.

Q. Do they charge any higher price for their seed?—A. They try to get a little more for it. They get a certain grant from Government and they sell the produce of the nurseries. The idea is that the nurseries should be as self-supporting as possible. The thing has done good undoubtedly. What I maintain is that it has not done work on anything like the efficient lines on which it should have been working.

Q. Freedom from disease would not improve the quality of silk?—A. No. That is why we have recommended for a long time that a properly qualified expert should be brought out, from France preferably, because there is a great industry there, to study this question, and we succeeded in getting a man. First Mr. Lafont came out in 1912, but unfortunately his health broke down and he had to go away and then we got M. Grangeon who had been for several years in Madagascar where he reorganised the silk industry, but unfortunately he was called away by his country as soon as the war broke out.

Q. These cross-breeding experiments which Miss Cleghorn is conducting, in what direction is she working?—A. With the idea of producing a better breed of silk worms. She is trying to produce a cross breed between the European breed and native breed. It will be polyvoltine. It is very difficult to get the natives here to take to univoltines. They are accustomed to the polyvoltine breed. Mulberry grows all the year round.

Q. She wants to get the quality of the European breed while maintaining the multivoltine character?—A. As near as she can.

Hon'ble Sir P. H. Stewart. Q. Assuming that you have disease free seed and there is an improvement in the quality of cocoons do you think that India will be able to compete with other countries?—A. Yes.

Q. As far as the Indian requirements are concerned or for export trade?—A. For export trade. As a matter of fact, there is a special demand for Bengal silk which is used for certain special purposes. The Bengal silk—I am talking now of the indigenous polyvoltine breed—is very brilliant and has a very bright lustre and it takes black dye very well, and in the old days it was and still is used largely for silk hats, though silk hats are rather going out of fashion.

Q. These experiments that Miss Cleghorn is conducting—how long have they been going on?—A. For a great number of years. Mr. Cleghorn was conducting such experiments for thirty years.

Q. Are they not carrying out experiments in Pusa in cross breeding?—A. I think that is quite on a different scale altogether; and I understand from Mr. Lefroy that they have done nothing.

Q. Has there been any practical result from these experiments?—A. As far as I know, none. But they have not been tried on anything like the scale on which they have been tried by Miss Cleghorn. She has a definite breed.

Q. You make a suggestion with regard to the appointment of a properly qualified expert?—A. That is for Bengal.

Q. Not Imperial?—A. Mr. Lefroy has a much bigger scheme for that, that there should be an Imperial silk department. That is to cover not only Bengal but Mysore and other places in India.

Q. In your opinion do the conditions and problems vary very much in different parts of India?—A. They are different. Take, for instance, Kashmir. The conditions there are totally different from Bengal.

Q. Which would be the better of the two?—A. Mr. Lefroy's idea of a silk institute is a very big thing. I think from the conversations we have had that he still has an idea that there should be a Director or Deputy Director of Sericulture for each province.

Q. The 19 nurseries are for Bengal?—A. Yes. I am dealing with Bengal entirely.

Q. Can you estimate roughly what amount of money Government should expend in Bengal initially and by way of recurring expenditure?—A. There was an estimate drawn up and put before Government. A complete scheme was drawn up with estimates of the exact cost of the whole thing. As far as I could recollect, it came to about three lakhs of rupees in regard to initial cost. If the nurseries are successful they should become self-supporting.

Q. Your silk man should be an expert?—A. That is where we have failed.

Q. He cannot be an ordinary business man?—A. You mean the superintendent?

Q. Yes.—A. There was a suggestion of that kind made at one time, that there should be a superintendent as well as a scientific man, but whether that is necessary or not I cannot say. If we could get Mr. Grangeon I think we would have a man who would do both administrative and scientific work.

Q. Anyhow you want a scientific man very much at first?—A. That is where we have been groping in the dark for the last thirty years, trying to do ourselves what we should have got other people to come and do for us.

Q. Trying on a small private scale very highly scientific and technical work which ought to be done on a really large scale?—A. The origin of the Silk Committee was entirely private. The original Silk Committee was started in 1888 or thereabouts. In those days there were several silk filature concerns. We started in a quite small way, each of us subscribing a certain sum of money and we started making experiments, and Mr. Ghose was brought in, but he is not what you may call a properly trained scientific man. What he knows is mostly what he picked up in the course of these years.

Q. Have you still your Committee?—A. After the Oldham Commission the Government practically took over the work though there is still a committee. The Government began by giving a yearly subsidy to the old committee. The Oldham Commission recommended that the Government should take things over themselves and subscribe a good deal of money and that an European superintendent should be appointed and things done much more thoroughly. An European superintendent was never appointed and they went on building more nurseries and the Government subscribed more money. But we have gone on without that scientific help which is absolutely necessary if really any good purpose is to be served.

Q. If your recommendations are complied with can you say within how long practical results may be expected for the benefit of the trade?—A. It is very difficult to say. You must take the mercantile aspect of the case into consideration. On the top of a high market like we have just now for silk you would find the thing spread like wildfire.

Q. In normal times?—A. It is a question of rupees, annas and pies to put it plainly to you. With these diseased eggs the rearer starts rearing, he spends his time on the work and his money in buying mulberry leaves and this goes on until about the fourth moult, when the disease breaks out and half his crop is wiped out by it, or even three-fourths of his crop. He loses his mulberry if he grows it himself or his money if he has had to buy it.

Sir D. J. Tata.—Q. Have you any knowledge of the work that is being done in Mysore in sericulture?—A. No; I have never been there.

Q. I have visited the silk farm in Bangalore once or twice. I understand that the Mysore Government arranged for schoolmasters from the various villages, where the worms were being reared, being sent to this so-called school of sericulture in Bangalore and trained them to the use of the microscope to examine either the eggs or the blood of the moth, and after they had learnt this sort of work they were sent to instruct the villagers in places where the rearing of worms was carried on. In this way the villagers were taught to rear a healthy kind of worm?—A. They tried the same thing in Bengal, but it was done only in a half-hearted way.

Q. The village schoolmaster can be taught the use of the microscope and learn to examine the seed?—A. If he is shown what he has to look for. All that the man who is using a microscope has to do is to look for pebrine corpuscles.

Q. There was an exhibition in Bombay recently of the silk products of the Bangalore farm and we were told that the silk now produced by the Salvation Army in Bangalore, who are in charge of the farm, was realising a very big price—a much higher price than what it used to realise in the old days?—A. There are enormously high prices just now.

Q. I think that was before the war and we were told that they had succeeded in improving the quality of silk and not only that, but that they were getting a little more silk out of the cocoons than they used to in the old days?—A. Yes.

Q. Has that been found possible here? Has any improvement being noticed here in the quality of the silk and the production?—A. The quality of our silk has not fallen off, but other countries have improved theirs immensely. From the records in our filatures we find that we are getting as much produce now out of the cocoons as we got many years ago and as much weight of silk. There has not been what you might call actual deterioration in the quality of cocoons.

Q. I understood that the quality of the silk was better in some way in Mysore?—A. Probably they are reeling on more modern principles.

Q. Probably due to cross-breeding; because I believe that experiments in cross-breeding were carried out—with what success I do not know?—A. I do not think that experiments in cross-breeding have been carried out to such an extent as to put the products of this cross-breed on the market. I have never heard so.

Q. We were shown cocoons of the pure French moth, the Italian moth and cross-breeds all showing difference in shades, the European was white, the indigenous yellowish, etc.?—A. An enormous number of cross-breeds have been made, but they have never got beyond the experimental stage. It is not done in Bengal on what might be called a commercial scale. It has not got beyond the laboratory. I think that if we could get over this difficulty of disease and introduce a breed superior to the present indigenous breed, there is a great prospect for the silk industry in Bengal.

Q. Or the rest of India?—A. I am speaking of Bengal. I have no experience of the rest of India.

Q. Mulberry can be grown pretty easily in a great number of places?—A. Yes.

Q. And as you say you can get a crop all the year round?—A. In Bengal.

Q. In the south, Bangalore, Mysore, Belgaum also. India was at one time the headquarters of the silk industry?—A. Yes.

Q. If the whole thing could be revived it would be very useful?—A. Yes.

Mr. A. Chatterton.—Q. Do you consider that the silk industry in Bengal as regards methods of sericulture and reeling is in a primitive condition, compared with Italy and France?—A. Are you referring to the rearing of silk worms or manufacture of silk?

Q. Both?—A. The system of reeling in Bengal seems to be the best system for reeling indigenous cocoons. Different firms at different periods for the last 20 or 30 years or more have tried to introduce improved machinery. We ourselves have done so. Some years ago we laid out a considerable sum of money in getting out reeling and re-reeling machinery, but we found that it did not work with the indigenous cocoon. The ordinary system in vogue now in Bengal is found to work better than anything else so far with these cocoons. If we had a better class of cocoons, of course, better machinery could be introduced. Reeling is practically handwork here.

Q. Do you employ Europeans?—A. We have two Europeans at present. We have not one European for each filature. A filature is not a big concern. We have a good number of filatures. In one filature we have 400 basins and in others we have 60, 70 or 100 basins.

Q. How long is the interval between one crop and another in Bengal?—A. We have three main crops in the year, which we call the November bund, the March bund and the July bund, or the cold weather crop, the hot weather crop and the rainy weather crop. In between these, we have what we call seed crops. There are two main varieties of worms, i.e., chotapoloo and nistri. Nistri does very well in the rains and chotapoloo in the cold weather and hot weather. In the rains the nistri gives you a very good cocoon to work with. In the cold weather and the beginning of hot weather the nistri cocoon is a papery thing. In between the main bunds they rear for seed purposes for keeping the crops going.

Q. Can you say what percentage of the crop is lost through pebrine?—A. I cannot tell you. I have no statistics.

Q. Does it amount to a half, or one-third or three-fourths?—A. I cannot tell you.

Q. If we were able to eliminate pebrine by how much would silk production increase at once?—A. The way it would increase silk production is that people would get good crops. It is very discouraging to a man to find half his work gone after he has spent his time and money on it. Sometimes he gets a small crop or no crop at all. At other times he gets a fairly good crop. There are native seed rearers who produce cocoons for seed purposes and they get better price for these than by selling to the filatures.

Q. Have any attempts been made, apart from eliminating the diseased seed, to improve the rearing houses?—A. Some attempts have been made under the supervision of the superintendent of the nurseries. These nurseries are supposed to be model rearing houses and at various times the Bengal Silk Committee have tried to help the rearers by giving them thread nets and encouragement in different ways, to improve their rearing houses.

Q. Have they been adopted?—A. I do not think they have been adopted to a very great extent. At present, there is an idea to get these men to rear very carefully under the eye as it were of the superintendent of the nurseries. It is very difficult to get them to use anything.

Q. Would you put the whole question of rearing seed under the supervision of the State?—A. My idea at present is that the two things should be worked together—introduction of a better breed as well as production of disease free seed. Some people treat the two problems as quite distinct. There are some people who will tell you that the present indigenous breed is the one which suits the country best, and that if we can get it pure and free from disease we will get along with it all right.

Q. Do you know what is the difference in weight between the ordinary European univoltine cocoon and Bengal cocoon?—A. There is a very great difference in weight. All that difference in weight is not in silk. The chrysalis in the European cocoon is heavier than that in the native cocoon.

Q. In the length of the thread?—A. A very good European cocoon will contain three or four times as much silk as a native cocoon.

Q. So that four native crops will bring as much as a univoltine crop?—A. But you can keep a larger number of native worms with the same amount of mulberry. Univoltines have never been reared in this country on a large scale but only on an experimental scale, and I am afraid I cannot give you any reliable figures on that point. An European worm eats a great deal more mulberry than a native worm. It is a much bigger worm. One of the objections with the natives have to the univoltines is that they eat too much and the rearer cannot have the same number of European worms in his rearing house, because they are big and take up so much more space.

Q. Would it be any advantage if you started conditioning houses as they have in France and Japan?—A. I do not think we have got to that stage of development. You must have a fairly big trade to pay for conditioning houses. We export most of the silk that we reel, but we also sell some of it locally.

Q. At present the weaver is in a very bad position in dealing with the Indian silk because it comes to him in a form which he cannot use?—A. We brought our re-reeling machinery and put it in some of the filatures,—in four filatures,—but we found we could not get a proper price for the re-reeled silk. The difference in price between the re-reeled silk and the raw silk did not pay us to re-reel and so we dropped re-reeling.

Hon ble Pandit M. M. Malaviya.—Q. You say that the decline of the industry is due, one, to the prevalence of disease among worms. Does the disease prevail now to a larger extent than before?—A. There are no statistical except that we know that the industry has gone down enormously.

Q. You therefore infer that one of the causes is the prevalence of the disease?—A. It cannot be anything else.

Q. For how many years have you been in this industry?—A. About 28 years.

Q. During this experience of yours has the disease been on the decline, or has it been spreading more and more among the worms?—A. The silk industry has gone down enormously during that time. Whether the percentage of disease is greater or not I cannot tell you.

Q. There are no statistics by which one can go, nor have you gathered any information from the rearers of cocoons as to the extent of the spread of the disease?—A. The information to be got on that subject is very unreliable. The best set of information you can get on that subject is the evidence taken by the Oldham Commission, and you will see what a variety of opinions they got. They went through every silk district in Bengal and took evidence from rearers, pickers, mulberry growers, etc.

Q. There are no reliable data then to support the view that the disease is prevalent to a larger extent now than it used to be, say 20 years ago?—A. I do not know that it varies. Let us say that the percentage has not increased, but if it continues and the rearer continues to lose a certain percentage of his crop he gives up the industry.

Q. You say that the Department of Agriculture has interested itself in the silk industry. Have any special efforts been made to destroy or check this pebrine?—A. That is what I have been describing in connection with the Government nurseries. That is run by the Bengal Government.

Q. But you think there should have been more done in that direction?—A. Much more should have been done. What has been done has done good. Probably if it had not been done at all, the silk industry would have been dead by this time.

Q. The second cause of the decline of the silk industry in your opinion is the inherent nature of the indigenous cocoons?—A. That is a matter of my personal opinion.

Q. You have had opportunities of comparing the Bengal, the European, the Chinese and Japanese silks?—A. Yes.

Q. You say that the Bengal silk is greatly inferior in quality. In what respect, in respect of strength and durability?—A. In many respects. The indigenous cocoon gives only about one-fourth of the length of thread. When reeling from this cocoon the threads are continually giving out and the reeler has to keep throwing on new threads. Therefore you cannot get the same regularity and strength in the silk. You cannot get the same cleanliness. Every time a new thread is put on, it makes a sort of hook which to the naked eye looks like a tiny bit of fluff on the thread of silk. All these things tend to make the price lower. The price of Bengal silk is steadily below the price of Japanese, French, Italian or Hungarian silk.

Q. How do the Japanese silk and the Bengal silk compare in point of strength or durability?—A. The Bengal silk is not so regular and it has not so much tenacity as the Japanese. The Japanese produce very good silk. They have univoltine worms. Their main crop is of the univoltine breed.

Q. You say that M. Grangeon organised a silk industry in Madagascar which is doing very well now?—A. That is what I understand.

Q. How many years did he take to establish it?—A. He was three years in Madagascar and he evolved in that time a polyvoltine breed from a univoltine breed. We have had samples of it and if we could succeed in introducing this Madagascar breed here it may be a most excellent thing for Bengal, because it is a polyvoltine breed.

Hon'ble. Sir Fazulbhoy Currimbhoy.—Q. Do you know that the shipment of Chinese silk is increasing every year?—A. I believe so.

Q. Have you any statistics?—A. It comes mostly through Bombay. We do not import it.

Q. Don't you think that the Chinese are able to sell their silk cheaper than what you can produce in India and therefore it is one of the causes why our trade is declining?—A. I believe that a good deal of the Chinese silk—the Canton silk—is of a very low quality.

Q. It is the Shanghai silk that comes in largest quantities. It is coming in very big quantities and we are now competing on this side too in a very large measure, and they are selling very cheap because the finer stuff goes to France and other countries and only the cheaper stuff comes to India. But if India wants finer qualities she could get them. The silks from China that are coming into India are all rejections. Do you think that the cheapness of that silk is one of the causes of our decline?—A. I do not quite see how that will affect our export. Take our filatures. We work for the European market principally, and therefore the fact of cheap Chinese silk coming here would not affect the price we can get. If the rearer gets a full crop it pays him.

Q. Do you think that if everything is done by the Government about the disease it will pay?—A. Yes. If the rearer gets a full crop he gets money out of his cocoons. If he spends money in buying mulberry to feed these worms and he gets a half or one-fourth crop, owing to his worms dying from disease, he loses his money.

Q. I only wanted to know from you whether you have studied that China and Japan are selling cheaper than you? That is the chief point. With a larger production would you be able to sell cheaper?—A. If a man gets a full crop. Generally pebrine develops in the last stages. The whole of Pasteur's system is based on this, that if you have a pebrine free egg there is no germ of disease in the worm when it is born and even if that worm contracts pebrine subsequently it will generally spin a cocoon and probably a good commercial cocoon. But if you start with an egg which is infected and the worm is diseased when it is born, the pebrine will develop and kill the worm before it can spin a cocoon. Generally the disease gets bad and develops and kills the worm late in the life of the worm so that, after the rearer spends money in feeding that worm, it dies when it ought to be about to spin a cocoon. If the rearer gets a full crop he can afford to sell his cocoon at a cheaper price and yet make a profit.

Sir D. J. Tata.—Q. Is there any reeling done in the cottages or do the people only breed cocoons?—A. They reel also.

Q.—They are all home-made reels?—A. Every one. The cottage-made silk and the silk made in small native filatures is the silk you are referring to. That is the silk which will come into competition with the cheap imported silk.

Q. What is the pattern of the reels?—A. The old Bengal pattern.

Q. Do you know anything about the Japanese pattern that has been introduced in Mysore?—A. Yes.

Q. You tried them here?—A. Yes. The Japanese reel is a very small reel and from that they re-reel on to the standard reel which is about 54 inches.

Q. It is supposed to be an improvement on Indian-made reels?—A. Yes.

Q. About the boiling of the cocoons—is there any difference in the methods employed in Europe, Japan and India?—A. In Europe the boiling of the cocoons is done in a separate basin from the reeling. The cocoons have always to be reeled from the hot water basin. In Europe and Japan too, they steam the cocoons first in a separate basin and then they are taken from that basin and put into the basin in which they are to be reeled. In Bengal the two processes are done in the same basin.

Messrs. H. A. F. Musgrave & H. F. Davy.

WITNESSES NOS. 108 & 109.

- (1) MR. H. A. F. MUSGRAVE, *Superintendent of Local Manufactures and Government Test House, Calcutta.*
- (2) MR. H. F. DAVY, A.M.I.C.E., *Officiating Superintendent of Local Manufactures and Government Test House, Calcutta.*

WRITTEN EVIDENCE OF MR. H. A. F. MUSGRAVE.

I wish only to state my views on some of the points which have not been touched or only briefly by Mr. Davy, the Officer of my Department, who officiated for me during my 6 months' absence in England.

This Department is in close touch with a very large number of existing firms who manufacture material used in engineering generally such as bridge and structural steel work, castings, cement, coal, oils, paints, etc., and it has struck me that the lack of progress or the failure of an enterprise is due, more than from any other cause, to the fault of the manufacturer through bad workmanship, or the selling of material of inferior quality so that before any Government financial assistance is given this question should be carefully looked into. On the other hand I think that Government assistance should not be withheld when an existing enterprise is retrogressing owing to want of capital, or support, due to the falling off of revenue provided such retrogression is due to unforeseen circumstances over which they have no control.

The support Government can give varies considerably, but in the majority of cases the assistance can be given by financial support, by loans, at small interest, or by increased purchase of the manufactured article, rigid inspection being insisted on as a source of control.

I think not only Government railways but companies' railways, and municipalities who are the largest purchasing bodies in this country, could with advantage to themselves guarantee to purchase, up to a limited amount, certain articles in this country from local firms provided that the quality of the article is up to a recognised standard and a satisfactory price and rate of production is assured.

One of the best examples of this nature is cement upon which subject the Officiating Superintendent has written. Large firms are in existence in this country, which manufacture cement up to the standard laid down by the British standard specification, and Government tests can be obtained at any time guaranteeing the quality of the material. In spite of this a comparatively small amount is sold in this country, buyers preferring to purchase in normal times the material at home from well established firms. This exemplifies the general feeling.

New enterprises cannot expect to be fed entirely by Government without making the initial efforts themselves. They must accept responsibilities and undertake certain risks.

On the other hand I do not consider that firms should be expected to supply themselves with costly plant, say for the building of large bridges, without some guarantee from Government or purchasing departments of other large bodies that the work will probably be given to them to justify such an expenditure. It would facilitate the purchasing of material out here, and at the same time benefit manufacturers, if all railways, not only those held by the Government, followed, as regards quality of material required for their maintenance, certain defined standard specifications, a number of which have been brought out by this Department.

If it could be arranged throughout India that purchasing departments could be centralised embracing Government Departments and companies' railways, with close connection with a central Testing and Inspection Department, much overlapping could be avoided.

A closer connection, as I suggest, is to my mind of the greatest importance, as from experience I have found that few understand our analyses of oils, cement, metals, etc. The information we receive is very meagre. For us to know the price of the material is essential (the name of the contractor can be legitimately withheld). Quality *versus* price must be balanced by some one who can interpret the analyses.

All railways would be able to reduce their stock of stores considerably if they published a list of their prospective annual requirements to be purchased in India and circulated this list to all newspapers. This list would act as a guide to manufacturers as to the large requirements of the country and the stock they could hold.

I am in accord with the remarks made by the Officiating Superintendent of Local Manufactures in regard to technical aid to industries. Except under very special circumstances, such as the inauguration of industries, involving the manufacture of raw material already produced in large quantity in this country such as tobacco, jute, sugar, oils, hides, etc., the services of experts would not be justified.

Technical aid to industries and research work.

There exists however a very sound body of trained and experienced men whose services could be utilised from time to time for the purpose of giving preliminary advice and general assistance.

An Advisory Committee as a tentative measure represented by a body of men nominated from the various technical laboratories and departments, and not necessarily Government Departments, could be appointed to assist in giving advice to all those requiring it.

The Advisory Committee should have a highly technically trained permanent Secretary, similar to that of the Institute of Civil Engineers and Mechanical Engineers at home, to whom all letters of enquiry should be addressed. The duty of the Secretary would be to address such members of the Advisory Committee who represent certain defined branches of science and industry with a view to obtain the assistance asked for and to classify the information when received from the various members.

Members of the Committee could be asked to sit once a year.

Research work as a whole cannot be carried on with advantage in India because—

1st.—The climate is against continuous work progressing under favourable conditions.

2nd.—India is devoid of the facilities which are present throughout England, due to lack of information obtainable from personal intercourse with other scientists carrying on similar work, and from lack of literature, and therefore a research officer is apt to waste considerable time in going over a good deal of ground which has already been exploited at home.

3rd.—Very great difficulty which has always been experienced in obtaining apparatus and re-agents for carrying on uninterrupted work.

Commercial
 intelligence and
 industrial journals.

Periodicals and monographs on industrial subjects are not widely spread enough in India. The tendency in this country is to ignore what any other centre is doing. One is too self-centred, distance and ignorance have a great deal to do with this

WRITTEN EVIDENCE OF MR. H. F. DAVY.

As a member of the staff of the office of the Superintendent of Local Manufactures and Government Test House, Alipore (at present Officiating Superintendent), my experience has been largely confined to the technical aspect of the questions which the Indian Industrial Commission is investigating. The ordinary work of the Department which I represent consists mainly in (a) the inspection during manufacture of various structures in iron and steel, machinery and plant, (b) the physical testing of materials used on public works and in mechanical engineering, and (c) the chemical analysis of materials or manufactures used in public works and railways.

The services of the department are also at the disposal of corporations and private persons for inspection, testing and analysis with the result that an increasing amount of work of a varied nature is being carried out.

Location and
 development of
 manufactories for
 structural and
 other materials.

Public works, whether under the direction of Government or private concerns, absorb the energies of a large number of men and play an important part in the development of the country. Excluding lime and bricks as manufactures, among the principal requirements are iron and steel and portland cement. The Tata Iron and Steel Co. have shown that steel sectional material of high quality can be manufactured economically in India; cast iron and castings are produced in large quantities and of recent years the manufacture of portland cement in quantity has been started with successful results. Steel plates have not been produced in quantity and as a result they are at present practically unobtainable. In normal times large quantities of sectional material and cement are imported. Geological Survey indicates that raw materials are available to such an extent that India might well be independent of imports of these things. Owing to the size of the country and the universal need throughout for the articles mentioned it is extremely desirable that factories producing them should be numerous and distributed in order to avoid the cost of transit for long distances from the factory to the site. Where materials which are bulky or heavy in comparison with manufacturing cost have to be conveyed by long distances the proportionate cost of freight makes it difficult if not impossible for the indigenous article to compete with seaborne imports. This will of course particularly apply in cases where the site is near a seaport or navigable river communicating with a seaport. (See note "A.")

There is then, in my opinion, considerable scope for the development of these industries in India.

chemical aid and
 research.

While it appears to me to be desirable that experts should be provided for the development of certain defined industries, it does not seem feasible to establish a bureau of experts attached to a research institution dealing with the development of industries generally. The term expert is frequently loosely applied. An expert, properly speaking, is a person fully acquainted with but one branch or aspect of a particular industry. Men having a good but general knowledge of one industry or several allied industries cannot do more than give a general opinion on a subject within their sphere of knowledge. Such an opinion although useful requires to be supplemented by experts in each aspect involved before the establishment of the industry can be decided upon definitely. Hence the number of experts required for the development of even a few industries would be very large and the question arises as to how such a body would be kept fully employed and the expense involved justified.

I am therefore of the opinion that with certain exceptions the most practicable solution of the general problem is to be found in the establishment and consolidation of the technical experience already available in the country for surveying possibilities and assisting development. There already exists a by no means negligible body of trained technical men attached to various departments and by bringing such men into closer touch with each other and employing them on questions within their knowledge much, I think, might be done to assist industrial development generally. Laboratories also already exist which might be employed in a similar manner. A difficulty at present seems to be that the services of technical men are either not available for work other than that of their department or if available are not made sufficient use of. Moreover the existence and location of the most suitable advice for the purpose is frequently not known to the person desiring assistance. Even in the case of my own department which is in close touch with manufacturing we are handicapped because, although assisted by small grants, the establishment is supposed to be largely self-supporting and the existence of the testing department is not widely enough known.

It would, I think, be desirable for departments like the one which I represent to be placed in such a position that assistance might be more freely given and factories whose manufactures come within their province inspected and reported on periodically. Information as to the location of technical men and institutions whose services might be enlisted should be collected and published so that when advice is required on any branch of industry communication can be readily established with the most suitable man or department for the purpose.

So far as research work is concerned, speaking generally I am of opinion that such work is best carried out in England. Greater facilities exist and it can be carried out there at less expense.

There is no doubt that considerable distrust of Indian manufactures on the part of buyers exists, and it must be admitted that there has been in the past ample justification for this attitude. In order to allay this feeling and to give confidence in the local product, inspection and testing is considered to be of great assistance, separating as it does the inferior article from the superior, and improving quality. My department was established to secure to Government as a purchaser sound articles with I believe useful results. This practice might be extended with advantage, works inspected, samples of products selected at random by the inspector and quality certified. Such certificates of quality would I feel sure assist in marketing a sound article and tend to improve quality generally.

I am also strongly of opinion that where inspection justifies such a step the policy of guaranteed purchase of such goods should be extended, arrangements being made for periodic examination of supplies to ensure the maintenance of the level of quality.

One of the chief causes of low quality in Indian manufactures is lack of adequate supervision of the artisan. My experience is that where close supervision obtains, a product of high quality results, workmanship reflecting accurately the closeness of supervision and any variations in it. Under able supervision the Indian worker is capable of acquiring a high degree of skill in craftsmanship. There is an urgent need for better supervision (preferably European) if the quality of Indian manufactures is to be competitive with that of the imported article.

The laws affecting trade names and descriptions are considered to be anything but satisfactory in their operation and steps should be taken to remedy the present state of affairs. Our experience shows that adulteration of articles both indigenous and imported is carried on freely. This would be mitigated by certificates of quality but further action in this matter is also urgently called for to protect consumers. (See note "B.")

NOTE A.

During the three years 1912, 1913 and 1914 the total importations of cement into India averaged about 3,000,000 cwts., of which about 2,500,000 cwts. (84 per cent.) came from the United Kingdom, the balance coming principally from Germany (300,000), Belgium (250,000 in 1912-13), Italy, Austria-Hungary and Hongkong.

Since the outbreak of war, imports from Germany, Austria and Belgium have ceased and those from other belligerent countries decreased considerably but the total imports for the past year were only about 16 per cent. less than the pre-war figure.

Importations from Japan have risen from 4 cwts. in 1911-12 to 638,000 cwts. last year and those from Hongkong from 57,000 to 180,000 cwts.

The importations are distributed as follows:—

Calcutta about	42 per cent.
Bombay "	27 "
Karachi "	9 "
Madras "	12 "
Burma "	10 "

Since the outbreak of war prices have risen about 70 per cent. and present conditions therefore are encouraging to the new industry and its development.

NOTE B.

Certificates of
quality.

For example the provisions of the Indian Merchandise Marks Acts and connected Acts where they apply to paints and materials for painting are capable of modification with advantage. Paints and pigments are very frequently wrongly and fraudulently described.

(1) Such vague terms as "Genuine white paint" should be prohibited as misleading. (2) White lead should be defined as basic lead carbonate and the application of the term to the sulphates and other lead compounds prevented. (3) The permission to describe such materials as genuine when they contain anything less than 5 per cent. impurities is unfavourable to the manufacturer of pure products. Genuine impurities are very small in amount and analysis readily shows whether the foreign matter is due to adulteration or is an accidental impurity. (4) The present rule that paints and pigments adulterated up to 50 per cent. be described as "reduced" should be altered to demand that the percentage adulteration be stated and accurate within 2 per cent. (5) "Lithopone" should be required to be marked with the percentage of zinc sulphide, as is customary in Great Britain, 1 per cent. latitude being allowed. (6) Turpentine should be described further by the name of its origin, e.g., "American turpentine." Turpentines from different countries differ widely in their characteristics.

Rules regarding descriptions of composition should be uniform for the indigenous and the imported article. Experience leads to the belief that misdescriptions are made wilfully by agents and sellers who are well aware of the nature of goods sold.

ORAL EVIDENCE, 5TH DECEMBER 1916.

Note—Mr. H. F. Davy accompanied Mr. H. A. F. Musgrave.

President.—Q. Can you tell us a little more about the organisation of your office. I understand that most of the purchases made through you are for the railways and the Public Works Department?—We make no purchases at all. We carry out the testing of any material the railways choose to send us; at the same time we undertake inspection of structural work for railways, the Public Works Department and the Military. We have an Inspector at Kulti near Barakar, in connection with the Bengal Iron and Steel Co.'s works, an Inspector for structural work, and another Inspector for wagon work who inspect work ordered by Government and other railways, etc., manufactured at the principal engineering firms of Calcutta. We make various tests of all the work we inspect.

Q. The Inspector who is at work at Kulti, is he a metallurgical Chemist?—A. He is not a chemist at all, he is simply a man who has a thorough knowledge of castings, and any tests he requires are made at our laboratory.

Q. The testing work is done by Dr. McWilliam at Kalimati for the Tata Iron and Steel Company's products; has he any connection with you at all?—A. No.

Q. Has Dr. McWilliam someone to pass the castings?—A. I don't know.

Q. Dr. McWilliam and his assistants have nothing to do with you and your assistants?—A. No, we run a sort of parallel department for separate work under the same head.

Q. Do you come under the Railway Board?—A. Entirely.

Q. Are you a member of any recognised service in India?—A. I am permanent Government servant belonging to the Superior Revenue Establishment of Indian State Railways. Mr. Davy came out specially to my department.

Q. Mr. Davy.—Are you under the ordinary Civil Service Regulations?—A. At present I am on contract.

Q. Mr. Musgrave.—You say in your note, that "it would facilitate the purchasing of material out here, and at the same time benefit manufacturers, if all railways, not only those held by the Government, followed as regards quality of material required for their maintenance, certain defined standard specifications, a number of which have been brought out by this department." How are these specifications issued to manufacturers?—A. They can apply for them. If you would like to see them, I will pass one or two round. The Railway Board issued a large number of them one or two years ago, and if anybody applies for them, we will give them. Most of the railways issue these specifications when they require any work to be done. All Government work is given out under these conditions.

Q. Is this extended and brought up-to-date from time to time?—A. Yes, it is entirely up-to-date.

Q. I don't understand what this paragraph means: "A closer connection is to my mind of the greatest importance, as from experience I have found that few understand our analyses of oils, cement, metals, etc."?—A. At present we work independently of the purchasing officer who sends us an article to be examined without stating its price or the use it is to be put to. In many cases it is impossible for him to interpret the report especially in chemical analyses and we are unable to express an opinion because we have such meagre information.

Q. What staff have you to do this work?—A. We have one senior chemist with two assistants under him. One practically does all the coal testing, and one English Physical Assistant, Mr. Davy, with two or three other men under him in the physical laboratory, and three European Inspectors doing outside work.

Q. Taking your chemists first ; you have three chemists ?—A. Yes.

Q. Your Senior Chemist, is he an organic chemist or inorganic ?—A. His qualifications embrace, both but his work is chiefly inorganic.

Q. His work is largely analytical ?—A. Yes.

Q. You are doing coal assay samples, I understand ; and the Mining Engineer of the Railway Board does it too ?—A. We do it for him.

Q. Practically the whole of your testing work is confined to engineering material ?—A. Yes.

Q. You would not be able to undertake tests of drugs and chemicals ?—A. Not in general.

Q. You have recommended an Advisory Committee "as a tentative measure represented by a body of men nominated from the various technical laboratories and departments, and not necessarily Government Departments, to assist in giving advice to all those requiring it." Is that a Committee you would have formed, in order to advise anyone who wants to start an industry ?—A. It is only a suggestion of mine. An Advisory Committee would be of great assistance, if they divided the men who were on the Committee into various branches, so that manufacturers could apply to the Secretary and the Secretary could write to the different branches to give whatever information the manufacturers would require.

Q. How is this committee to be maintained ; are they to be honorary advisers ?—A. Yes.

Q. What size committee would you have ?—A. It is a thing I have not gone into very deeply. I have only just returned from leave.

Q. A committee of that kind would not be able to give you advice on, say geology ?—A. I don't know ; it would all depend on whether the members were chosen for that purpose. There are a lot of men who do not know where to apply to for information and if there was a permanent Secretary, who would deal with these things, they would all apply to one head.

Q. There is only one Geological Survey in India, equipped to deal with any one's geological problems ?—A. It is only known to certain men of certain branches of engineering.

Q. If you multiply the number of "post offices" you will create confusion. Enquiries are now simplified in connection with geology, and yet you want another institution to refer geological problems to ? Do you think there would be any advantage in forming a new committee ?—A. You have mentioned a particular branch, but there are many others for which the committee would be useful.

Q. Mr. Davy.—Mr. Musgrave was speaking to me about this the other day, and the point he made was that this committee would be representative of all the different departments together, i.e., the Geological Survey, Pusa, and various other departments would all be represented on the committee, and the functions of the Secretary would be more or less to bring into unison all these various departments where the industry affected them. But there is now a Board of Scientific Advice ?—A. I have never heard of it.

Q. Had you not better get some knowledge of existing Government organisations before starting new committees ? There is already a Board of Scientific Advice, composed of the heads of certain scientific departments.—A. Its existence is not generally known any more than that this department is at the disposal of any one requiring work done ?

Q. It is unfortunate for the public not to have one definite department for each natural group of subjects. They would then know exactly what to refer to you and what to other departments ?—A. I take it that the Metallurgical Chemist, Mining Engineer, etc., are practically under one department under the Railway Board. There is a certain amount of correspondence between us, i.e., we refer questions of metallurgy, which are beyond us, to Dr. McWilliam, who is an expert, and we get his opinion, and send the report out as a whole, embodying his report and ours.

Q. As long as you are working with a man like Dr. McWilliam I know no harm is coming of it, but the want of an organised system is likely to lead to friction. If you were organised as one department under the Railway Board or Public Works Department, and had an obvious head, questions that came in could be referred either to Dr. McWilliam or to you. It would be his business to see that all branches were brought into correlation, and that the opinion expressed was the real opinion of the department ?—A. With reference to the question of the work at Kulti and at Kalimati, Dr. McWilliam would be the last man to suggest that he was an expert in casting work which is what we do at Kalimati.

Q. Not Dr. McWilliam himself, but he has a staff ?—A. I don't know what staff he has, but the casting work at Kalimati is a fairly recent thing, I believe.

Q. Would it not be better if this was all organised as one properly constituted department with a head to it ?—A. It has worked very satisfactorily up-to-date from the time it started five or six years ago, and there is no reason to presume that we cannot get experts on any single subject if required. This department has practically started with a small testing laboratory attached to it, but it has increased considerably.

Q. Is it not time, after it has grown in this experimental way and has shown its value, for us to mould it into a regular organisation ?—A. We have a budget of our own, and the work carried out does not need any further assistance than we have already.

Q. Supposing we started the testing of drugs and oils ?—A. We test oils at present.

Q. You would not test drugs?—A. Generally speaking no.

Dr. E. Hopkinson.—Q. Lubricating oils?—A. Yes.

President.—Q. You would not undertake essential oils?—A. No.

Q. Referring to the Advisory Committee which you suggest, you say, "Research work as a whole cannot be carried on with advantage in India." Do you mean research work in engineering?—A. It is my opinion about research work as a whole. My department is connected with structural work.

Q. There may be a certain number of research problems in engineering which can be undertaken more suitably at home, but India is not devoid of facilities for research work, or it ought not to be. You can develop a good laboratory here if you have centralised departments, but not if you have scores of little departments. Research work is properly provided for in some of these departments which have been centralised. They have very well organised libraries and reference collections, and are well equipped. You don't mean that research work as a whole should be undertaken out of India, do you?—A. I only refer to the difficulties we have in certain research work; for instance in the bye-products of coal we would have trouble if we began research work in Calcutta where the climate is unsuitable, and intercourse with other people is difficult.

Mr. A. Chatterton.—Q. In reference to this question of cement, why is that there is a general local feeling against the use of cement manufactured in India?—A. The reason I have heard stated is that there are well-established cement making concerns at home, and therefore, people prefer to use material which has been tested for years and found perfectly sound.

Q. Do you know if Indian cement makers periodically submit their cement to proper tests?—A. We have made these tests out here for different companies in India.

Q. Would it establish confidence in the use of Indian cement if the works would make better arrangements for the regular weekly testing of their output?—A. I should think it would. We try to impress upon everybody the necessity of these tests, and that makers should send their cement to us, as we are a Government Department.

Q. Do you know whether in this particular instance the Indian cement makers are able to comply with British standard specifications?—A. They follow our specifications.

Q. Do they comply with them?—A. They have to comply with them.

Q. Because it has come to my notice that very large quantities of cement have not been found up to English standard?—A. Quite so. That is because large consignments of cements are either not tested at all or not frequently enough.

President.—Q. Would you make that test for a buyer?—A. For anybody, buyer, maker or anyone.

Q. For a fee?—A. Yes, we have a set of scheduled rates for these things.

Mr. A. Chatterton.—Q. In regard to Government assistance, you say that "not only Government railways but companies' railways and municipalities who are the largest purchasing bodies in this country could with advantage to themselves guarantee to purchase up to a limited amount certain articles in this country from local firms, provided that the quality of the articles is up to a recognised standard and satisfactory price and rate of production is assured." Why should they not purchase their whole requirements in this country, if they are up to recognised standard?—A. Certainly, but at all events a percentage.

Q. But you don't suggest that these public bodies should guarantee to purchase all that they require. Why not?—A. If they can be supplied in India certainly.

Q. I think you have said that most of the specifications you issue are British standard specifications?—A. Yes, with slight modifications due to climate and other things.

Q. Do individual railways issue special specifications drawn up by their own engineer?—A. Some do.

Q. You have nothing to do with construction?—A. A great deal in passing bridge and structural work.

Q. That is the materials?—A. Not at all. We pass the material and workmanship too.

Q. And with reference to specification for materials?—A. Yes.

Q. When these engineers prepare their own specifications, do they differ from the British standard?—A. The State railways follow it entirely. One or two other railways are following it.

Q. You say, "There exists, however, a very sound body of trained and experienced men." Whom are you alluding to in this particular instance?—A. I refer to all Scientific Government Departments in India.

Q. How do you propose that these men should be employed in this way; do you mean that these men should be allowed to do private practice?—A. Not at all. I was thinking more of the International Association for Testing Material, which is no longer in existence, that had their Secretary in Vienna, who was a paid man. Certain men dealt with certain subjects. When any question was asked the Secretary regarding certain things, he referred it to the various branches which dealt with the subject, but these men were not paid men; they simply acted in a honorary position and gave the advice required of them.

Dr. E. Hopkinson.—Q. Is your laboratory, the only Government testing laboratory in India?—A. No. There is a metallurgical inspector's laboratory at Sakchi but he deals with iron and steel analysis only.

Mr. A. Chatterton.—Q. Do you not recognise the testing laboratories attached to the Sibpore College. There are very complete testing laboratories at Roorkee and Madras?—A. I do not know about them.

Dr. E. Hopkinson.—Q. You are under the Railway Board?—A. Yes.

Q. You have no official connection with the Public Works Department?—A. No.

Q. You take both public and private work?—A. Yes.

Q. Can you give us any idea as to the relative magnitude of the two?—A. About 90 per cent. of our inspection work is Government work and 10 per cent. private.

In testing physical and chemical about 90 per cent. is for Government and 10 per cent. private, *vide* details below—

Inspection—Total value of material.

	Rs.
State Railways and other Government Departments	30,10,406
Companies' Railways and Feudatory States	4,94,749
Private bodies	4,908
Total average for 3 years	35,10,063

Testing—Total number of Chemical.

Physical tests average for 3 years.

	No.
State Railways and other Government Departments	3,089
Companies' Railways and Feudatory States	75
Private bodies	200
Total	3,364

Q. How many samples of cement have you tested?—A. About 200.

Q. What do you charge?—A. Rs. 64 for a complete test.

Q. Do any of the Provincial Governments or the Directors of Industries consult you?—A. We have never had any note from any Director of Industries since we have been in existence, which is some years now.

Q. Nor from any department of the Provincial Governments?—A. Very seldom; we do from time to time; the Public Works Department do.

Q. Are you consulted both as to specification of material and also as to material being up to specification?—A. Yes, specifications are frequently compiled by us.

Q. Can you in your laboratory test a dynamo efficiently, or a pump?—A. No.

Q. Could you inspect a steam boiler and license it for any particular pressure?—A. This is the work of the Boiler Inspectors under the Steam Boiler Act.

Q. Do the consulting engineers at home ever refer any question to you at all?—A. We have not had a case.

Q. You are not in communication with them at all?—A. No.

Q. But you are in communication—at least you know the work that is being done by the Standards Committee?—A. Yes.

Q. Have they consulted you at all?—A. Indian specifications were sent home to the Secretary of State and examined, and correspondence took place extending over a number of years before they were accepted.

Q. Are they adopted by the Standards Committee?—A. They are adopted out here, but if you read them through you would see that we are following the British standard specifications except in one or two cases.

Q. Have you any communication with the National Physical Laboratory?—A. No, I have visited it, but apart from this we have no intercourse with them.

Q. Supposing you were in any difficulty and some subject turned up beyond your equipment would you refer to them?—A. We would not undertake what we could not do. If we were in difficulty we would refer to them.

Q. So far as you know, the National Physical Laboratory has done nothing for India as yet?—A. Not as far as I know.

Q. Has the Government of India any means of checking weights and measures?—A. I don't know.

Q. Can you undertake the test of electrical instruments?—A. No.

President.—Q. Have you any staff for it?—A. No.

Dr. E. Hopkinson.—Q. The same thing would apply to thermometers?—A. Yes.

Q. You speak of the purchasing officer of the Government of India consulting you at various times. Who do you mean by the purchasing officer?—A. Railway and Public Works Department Engineering and Stores Officers.

Q. You don't know to what extent testing work is done by the universities?—A. No.

Sir D. J. Tata.—Q. You test only articles that are bought in this country for the various departments?—A. Yes.

Q. Nothing that comes out from England?—A. No. These are tested at home before export usually.

Q. When railway materials are bought for a railway and come out from England, you don't test them?—A. No, but when there is any particular case in which there is some doubt about a cement, for instance, we test it out here.

Q. In the case of iron and steel you take everything that comes from England on trust?—A. We test every bit of steel used on work under our inspection.

Q. Rails?—A. We don't touch rails. Dr. McWilliam is doing that.

Q. But the rails which have come out from England?—A. They are tested at home.

Mr. C. E. Low.—Q. I understand that your testing work is practically confined to engineering materials, to lubricants and cements; is that correct?—A. Yes, all materials used in engineering structural work.

Q. It has been suggested to us by previous witnesses that certain classes of indents which are sent to the Stores Department of the India Office, at present, might, with advantage, pass through some official in this country who is acquainted with engineering possibilities pertaining to the country, and if that were done, it would result in making existing stores rules more effective by securing a greater proportion of engineering materials and stores being purchased in this country. I am asking you with special reference to the class of article you are dealing with at present; supposing all indents for those classes of articles, before being submitted to the Stores Department, passed through your hands, do you think you would be able to point out cases in which those articles could be procured equally well, and not at unfavourable prices, in this country?—A. I wrote a letter to the Railway Board which I sent you to read. It was a suggestion I made to the Railway Board before I went on leave. I am very much in favour of that. Briefly I said that quality of material and work, and rate could all probably be arranged satisfactorily, and that therefore it would be better for us, as we have a big control over all these firms, to handle these indents.

Q. Do you think it would cause undue delay?—A. It would not cause any delay at all. We could do things quicker than anybody in the country.

Q. In cases where the indents had to go to the Stores Department, would it cause delay?—A. No, I don't see why it should. The same system was carried out in South African Railways. I was there many years.

Q. Of course you have opportunities for gaining information regarding this class of work which the executive engineers or superintending engineers could not possibly have?—A. Our inspection work is tremendously big. We have taken on the Assam-Bengal Railway, the Hyderabad lines, nearly all the Bengal Nagpur Railway engineering work, and a great deal of work from other railways, and all that within the last few years. We inspect this work, and after passing it, give certificates, and on these certificates the work is paid for.

Q. Is that work performed by Indian firms for these railways?—A. Yes.

Q. You also point out that in the converse case, where a Government official or a railway official was placing an order with an Indian firm, who, he knew, could not dispose of it satisfactorily, you would be able to tell him so, and put him on to a more likely firm?—A. Quite so.

Q. What is your staff?—A. We have three outdoor inspectors.

Q. What qualifications have those officers got?—A. They are men who have been trained absolutely for the particular work they are going to look after.

Q. Are they upper subordinates?—A. Yes.

Mr. A. Chatterton.—Q. Do you undertake tests of work that has come out to this country and failed; do they send them to you to investigate?—A. Yes. There have been certain works sent out which failed. We make whatever tests we can.

Q. Can you deal with such questions as this: some years ago a number of copper fire boxes were sent out for locomotives. They all proved failures: do you deal with questions of that sort?—A. Most certainly.

Mr. C. E. Low.—Q. Only if you are asked to?—A. Yes.

Mr. A. Chatterton.—Q. You have the laboratory equipment necessary for dealing with such things?—A. Yes.

WITNESS No. 110.

Shri S. N. Mitra. BABU SAILENDRA NATH MITRA, Proprietor of the Bande Mataram Match Factory, Calcutta.

WRITTEN EVIDENCE.

— floated a company called the Small Industries Development Company, Limited, in 1908 and found great difficulty in raising its capital. Some rich men who were its promoters

hacked out at the time of payment of their shares. The whole capital of the company was then raised from my friends and acquaintances who were all middle class men.

Several soap factories started in Calcutta by individuals with small capital have in a way killed themselves owing to price cutting competition sacrificing the quality accordingly. Two or three would have been sufficient instead of a dozen and they could have made decent profits and would have been successful concerns by this time.

I have no personal knowledge of any Indian enterprise having received any financial Government aid from the Government. I made certain suggestions to Mr. Swan when he was making enquiries about Bengal industries. In my opinion Government aid ought to be given to the existing or new Industries in the following manner :—

- (a) Loans through the bank with low interest.
- (b) Supply of additional machineries to increase the outturn of the factories on the hire purchase system.
- (c) In case of new enterprise by subscribing a portion of the subscribed capital if the promoters can raise the remainder of the capital.
- (d) By purchasing the products for a certain period.

In all cases the accounts of the company are to be audited by the Government auditors. In case of (c), Government ought to appoint directors with defined powers in the board of management of the company.

Government ought to take the lead and start demonstration factories with the raw materials available locally and hand over the same to a private capitalist or a company as soon as the experimental stage is over. Pioneer factories.

Industrial and Agricultural Banks ought to be started in each province of which one-half of the capital is to be subscribed by the people of the province and the other half by Government. Government ought to keep a fixed amount each year in the banks and through them help industries and the agriculturists. The board of management of such banks should be one half Government nominees and the other half to be elected from the shareholders. Financing agencies.

Government ought not to help any new enterprise if there are two or three of its kind in the province. Limits of Government assistance.

There ought to be a technical institute for Bengal, where the best scientific students of the Calcutta University will be employed in the laboratory for research work. The director of the institute should be a high class scientist of industrial reputation for a fixed period. He should be assisted in his work by a set of professors having special aptitudes in their special departments. The research work should be devoted to the production of that class of material which is imported here and made out of the raw materials exported from here. There should be a department for the rapid commercial analysis and testing of materials submitted by private individuals on a nominal fee. Technical aid.

To the above institute the other Government Departments, e.g., Geological, Forest, Surveys for Agriculture, etc., should send specimens of economic interest for investigation with regard to their utility, usefulness and adaptability for a particular industry. The departments will then undertake to have a detailed survey of these and other materials which are found in abundance here. Industrial purpose.

To the above institute should be attached a library containing a complete set of technical and scientific books and periodicals in the principal languages of Europe where the workers will get every facility to have an up-to-date information on all industrial and scientific subjects. Library.

To the above institute should be attached a commercial museum containing samples of the articles imported here and which are manufactured out of the raw materials exported from here. It should also exhibit the various stages of the manufacture together with a note indicating the capital used in the industry. Commercial museum.

It should publish regularly a journal containing the results of researches conducted in the institute showing the possibility of these industries here. The journal might be profitably distributed free to those individuals who are interested in such industries and to industrial concerns and to public libraries. Journal.

The Department of Industries will start demonstration factories of such industries which will be suggested by the technical institute which have been found suitable, useful and adaptable to the local conditions. Such demonstration factories when found profitable and after the experimental stage is over should be handed over to private capitalists or companies willing to start the same and the results derived together with the expert knowledge available should be placed at their disposal. Demonstration factories.

Some of the best workers in the research institute after they have arrived at some results of some industrial importance and feasible here ought to be sent abroad to see and work in European laboratories and factories and see for themselves how they do these things and improve their stock of knowledge. Research abroad.

Commercial museums are useful and ought to be kept in Calcutta, Bombay and Madras as stated in connection with the technical institute. Commercial museum

- Sales agency.** As the number of industries grow sales agencies will be established by others or a syndicate can be formed to take up this work and facilities through the bank are to be given to take up invoices and pay at least 75 per cent. as advance.
- Exhibitions.** Exhibitions are not useful and they ought to be held once in 10 years to educate the people.
- Government patronage.** Government Departments ought to purchase local articles in preference to imported ones and thereby give a stimulus to the manufacturers. Government officers ought to see the articles exhibited in the commercial museum and purchase the necessary articles from the manufacturers.
- Supply of Government owned raw materials.** Government ought to supply raw materials to the manufacturers at the cost price, for otherwise it would be very difficult for small factory owners like my humble self to arrange for these. If I had got timber from Government Forest Department then I would not have closed my match factory. If the Baluchistan Government had been good enough to supply cedar wood then we would not have gone to East Africa for it.
- Land policy.** The Land Acquisition Act will suffice, only a section is to be added that land required for industrial purposes can be acquired by the Land Acquisition Collector at the requests and expense of persons intending to start an industry.
- Training of labour.** In all new factories small boys are to be taken in, say of 8 or 9 years and if they are trained then they can work any intricate machinery. In my match and pencil factories I took in Bengali boys of 8 years and they are working all the machineries to my satisfaction and are turning out the full outturn mentioned in the catalogues. I had two Europeans in my two factories and they also expressed the same opinion. No use of industrial schools for this class of people. They can be taken as apprentices in factories on nominal pay and their pay can be increased as they become useful. As regards educating them, night schools may be opened to teach them reading and writing. Some of them know how to read and write. Women also may be employed for they are intelligent and learn their work easily.
- Training of supervising and technical staff.** In my opinion school going boys of 8 or 9 years ought to be taught drawing, carpentry, smithy, etc., for two hours a day in the primary or H. E. schools and those who wish to have more technical training will join the industrial schools or colleges leaving the H. E. school in the Matriculation class. In the industrial school or college they will be taught such theoretical and practical subjects as will enable them to do the work of a foreman. During their stay in the industrial school or college facilities will be given to them to work in the engineering shops and big workshops and factories to learn the use of machineries. I think in this way mechanical engineers with sufficient technical knowledge may be secured. They might be given sufficient facilities to work in the research institute if they are found capable, and also in the demonstration factories at the request of a person interested in industry or at the request of the principal of the industrial college. To learn the special subject they ought to be apprenticed to a factory for two years or so and this will enable them to manage the technical part of the factory satisfactorily. The other kind of supervisor can be trained by taking in matriculates in a commercial school or college where they will learn accounts, book-keeping and other commercial subjects which will enable them to work as business manager in a factory.
- Official organisation.** There is no such organisation in my province for the development of industries. One Imperial Department under a single head will not be sufficient. I state below what is required and each province ought to have the same departments :—
- (a) Industrial and Agricultural Bank.
 - (b) Research institute with laboratories.
 - (c) Board of Industries to start demonstration factories.
 - (d) Reorganisation of primary and secondary schools to enable boys to have rudimentary technical training in these schools and they will be managed by the Education Department or the University.
 - (e) Industrial schools or colleges to be placed under the Board of Industries.
 - (f) Commercial schools and colleges to be placed under the Board of Industries.
 - (g) For each of the above sufficient amounts to be earmarked every year in the Imperial Budget.
 - (h) Industrial reports and trade journals are to be issued by the research institute if possible in the vernacular of the province.
- Technical and scientific departments of Government.** No organised technical and scientific department exists in Bengal except the Sibpur Engineering College. No Imperial Department sitting at Simla, Delhi or Darjeeling will be of any use to the country. Such departments ought to be started in or near Calcutta and so easily accessible to all by rail. Supreme power is to be vested on the head of each department I have enumerated above.
- Commercial intelligence.** Statistics are prepared in a way on which much reliance cannot be placed for the village chowkidar is the authority from whom these statistics are collected, namely, the crop report and the price of food grains, etc., I have seen these done. As regards statistics of other things I do not know anything and cannot say anything. These statistics are published in the local Gazette in English, inaccessible to the public, and 999 out of 1,000 do not know

anything about them. The same thing can be said about the Commercial Intelligence Department.

Outside the municipal limits there are very few roads and consequently nearly 4 to 5 months in the year transporting of goods is impossible. Gradually waterways are being silted up and inland navigation is becoming daily impossible.

The freight charged by railways are excessive for they charge by the marked capacity of the wagon whereas the actual weight of the goods conveyed is less. On 2 or 3 occasions I had to pay Rs. 2-1-6 per maund instead of Re. 1-6-10 quoted by the railways for wood from Baluchistan. Generally the railway companies charge excess freight and to get a refund of this one will have to wait at least one year and write at least a dozen registered letters. In one or two cases I did not get any refund. I easily got concession in freight from the Darjeeling-Himalayan Railway and did not receive any reply to my letter addressed to the Traffic Manager, Eastern Bengal State Railway, on the same subject.

The Forest Department ought to be worked in a business-like way. I ascertained from the Dehra Dun authorities that one class of wood can be had in plenty in the Gharwal Division. In page 42 of the Commercial Guide to the Forest Economic Products in India appears "under article 29 *Cupressus Torulossa* (Himalayan Cypress) Outturn and price:— The possible outturn is not very large but sufficient probably to meet such demands as may be made on it for the manufacture of pencils. Mr. Milward, Divisional Forest Officer, Jaunsar, states that he had 53 trees for sale in 1910 and that on demand arising that number could be trebled. The price in Calcutta would be somewhat over Rs. 45 per ton."

I am submitting herewith separate statements about the match and pencil factories which were started by me.

The following is a short history of the match industry in Calcutta and the difficulties which were felt about the supply of match wood for the Bande Mataram Match Factory:—

This factory was originally started by Sir (then Dr.) Rash Behary Ghose, Kt., C.S.I., C.I.E., in 1907 under my management. *Gaon* wood from Sunderbund was used and various other woods were tried but some of them proved useless and some proved too costly. *Gaon* wood proved successful in quality and price but the dealers did not like it for the sticks become brownish after chopping, so difficulty was felt in selling them in face of Japanese competition. In 1908 I joined the factory as its managing partner and received from Mr. A. Roller of Berlin (who supplied all our machineries) by the end of 1910, sample sticks and boxes made from some Indian woods and their names. I wrote to Mr. R. S. Pearson, the Imperial Forest Economist, Dehra Dun, and he very kindly informed me that one of these woods could be had in the Darjeeling Forest in large quantity. I requested him to write to the Conservator of Forests, Bengal, about the same. On the 15th July 1911, I received a communication from the Conservator of Forests, Bengal, on the subject and in September 1911, I received two sample wagons of *Evdia* wood from the Conservator of Forests, Bengal. The Conservator failed to make arrangement for a regular supply when the wood was found suitable for my use. The Deputy Conservator referred me to *Pakhay Lall* and *Nandu Sirdars* and settled the price at 7 annas per maund (*vide* his letter No. 716-G. of the 23rd March 1912). I took from them nearly 1,000 maunds of wood during June to September 1912. I sent a representative of mine to see the Conservator and try to lower the price and find out whether any other similar wood can be had. My representative had an interview with Sir H. A. Farrington, Bart, Deputy Conservator of Forests, and he very kindly intervened and made the abovenamed contractors lower the rate to 5 annas 6 pies per maund and promised to send two pieces of another wood called *Kapasi*. It was found to be very suitable for sticks and I wrote to the Deputy Conservator about it (*vide* my letter of the 30th November 1912 and his reply of the 4th December 1912). The contractors failed to supply any *Kapasi* wood but supplied nearly 1,000 maunds of *Evdia* wood during October to December 1912, but stopped sending any from the end of December 1912 and repeated letters were sent to them but to no effect. From the stock in hand and by purchasing local *Gaon* wood and other wood and by working three days in the week I continued my work till the end of July 1913. Hence I was obliged to address myself to the Secretary, Revenue Department, Government of Bengal, on the 8th March 1913; reply to that was received from the Conservator of Forests, Bengal (*vide* letter No. 609-410 of the 25th April 1913). A comparison of his letter No. 609-410, with his letter to the Imperial Forest Economist, Dehra Dun, dated the 12th July 1911, and that of the Deputy Conservator of Forests, No. 750-G. of the 4th December 1912, will prove that either the Conservator and Deputy Conservator of Forests, Bengal, had no personal knowledge of the forest or they did not like anyone using these timbers for industrial purposes. I had an interview with the Conservator of Forests, Darjeeling, on the 5th July 1913, and he very kindly showed me a report from the Divisional Forest Officer, Kurseong, that 8,000 maunds annually of these two timbers could be had from his Division alone. I requested him to supply the required timber departmentally and he asked me to get an order from the Government of Bengal about the departmental supply and he would make the necessary arrangement.

The Hon'ble Dr. Nilratan Sircar kindly arranged an interview with the Hon'ble Mr. Lyon and he very kindly granted a patient hearing to me and asked me to submit a memorial to him stating all the facts. I sent the same some time in September 1913 but unfortunately forgot to put the date in it. I received reply from the Officiating Secretary, Government of Bengal, Revenue Department (*vide* his letter No. 3718-M. R., dated the 15th November 1913). On the 21st November 1913, I sent a reply to the same (*vide* my

letter of the 21st November 1913) and got reply to it on the 15th December 1913 from the Under-Secretary to the Government of Bengal, Revenue Department, asking me to see the Hon'ble Mr. Kerr about the supply of wood. The Hon'ble Dr. Sircar kindly accompanied me on the day when I had an interview with the Hon'ble Mr. Kerr. He gave me a patient hearing and asked me what minimum quantity would suffice and I mentioned 5,000 maunds in each year to which he agreed and suggested a rise in the price and I agreed to this also. He took down notes of these and both Dr. Sircar and I were impressed that 5,000 maunds of timber would be given to me yearly at 7 annas a maund and we came away satisfied. After that interview I arranged labourers and employed two or three most necessary men to cleanse the machineries and wrote to my manager to join from February next. On the 12th January 1914, I got a letter from the Hon'ble Mr. Kerr which fell upon me like a bolt from the blue and all my future hope of recouping myself was shattered. I dismissed the men and closed the factory for good. I could not make out the reason for this and do not know up till now why I was deprived of this privilege and through whom. If this had not taken place then I could have worked the factory successfully and made a decent profit for the worst brand Japanese matches are being sold at Re. 1 per gross now.

After the war broke out the Government of Bengal deputed Mr. Swan to visit and report on the existing factories in September 1914, and I quote the following from his report:—"Forest Department should make special arrangement for the supply of wood on favourable terms to such industries as match, pen and pencil making," but up till now nothing has been done.

Then the famous debate in the Bengal Council took place at Dacca in July 1915, on the motion of Babu Surendra Nath Banerjee but he was silenced by the Hon'ble Mr. Beatson-Bell by stating many things such as the trees are scattered in the Darjeeling Forest—as if a forest must consist of one kind of trees only and closely packed—and further referred Babu Surendra Nath to read "Commercial Guide to the Forest Economic Products of India" and "A Monograph on the prospect of the Match Industry in the Indian Empire with particulars of proposed Match Factory sites and woods suitable for match manufacture." It was just like Greek to an ordinary Bengali and Babu Surendra Nath and his honourable colleagues sat silent for every one of them was as innocent on the subject as babies unborn and the same thing must be said of the Honourable Member-in-charge of the Forest Department for he acted the part of a blind leading a blind, for he I am sure himself had not seen these books. Otherwise he would not have ventured to cite these rulings which will go against him. In the first book, namely, "Commercial Guide to the Forest Economic Products of India" there is no mention about the wood in question and about the match industry. I quote below from Part I, Volume I, from the Indian Forest Memoirs by Mr. R. S. Troup, F.C.H., Imperial Forest Economist, page 146, No. 228—" *Evodia Fraxinifolia*: description of wood: small or moderate sized tree wood white soft. Chief uses: posts of huts and excellent for matches." Indian Forest Memoir, Part I, Volume 2—"A Monograph on the prospect of the Match Industry in the Indian Empire with particulars of proposed Match Factory sites and woods suitable for match manufacture"—by the same author on page 48, No. 12:—" *Evodia Fraxinifolia* is one of the woods available in Bengal for match making. At the bottom of the same page "proposed site for the Match Factories in Bengal" occurs Calcutta. On page 49 of the same book Mr. A. L. McIntire, Conservator of Forests, states:—"That after a full consideration of many factors necessary for the successful maintenance of such factory Calcutta and its environs—Khulna and Port Canning—are the only localities in which for the present, at least, capitalists are likely to invest their money on match factories." In page XXIV of the same book under particulars regarding the suitability of Indian woods for match manufacture appears:—

No.	Scientific name.	Vernacular name.	Where found.	Suitability for match.	REMARKS.
18	<i>Evodia Fraxinifolia</i> .	Kanukpa, Nep; Kanu Lepcha.	Eastern Himalaya 4,000 to 7,000 ft. Khasia Hills.	"Very suitable for peeling, sticks very good, also most suitable for boxes. An excellent wood for match manufacture. Can be peeled in fresh conditions."	Sample from Kurseong Forest Division, Bengal. The sample floated in the green state.

* These were tested and reported by Mr. A. Roller of Berlin.

In the map annexed with the same book the places suitable for match factory is marked with green ink and against Calcutta there is a mark like it.

I am very much thankful to the Hon'ble Mr. Beatson-Bell for the kind advice which he had given me through Babu Surendra Nath in his Dacca speech and I have found out the mistake which I have committed in taking up a hopeless industry in Calcutta, but in that case I have erred with the Officers of the Imperial Government and this is my only and sole consolation and so I cherished in my breast a natural hope that when I erred with the Imperial Officers then they will try and help me out of this and will not make me—a poor man—lose so much money. With this hope in my breast I did approach the Government of Bengal.

As regards railway freight I saw the Manager, Darjeeling-Himalayan Railway, in Darjeeling and he asked me to send a formal letter and I did this and got the reply (*vide* letter No. D. K.-2207, dated 24th July 1913). The original freight was, I think, 7 annas 8 pies per maund from Darjeeling to Siliguri and it was lowered to 2 annas per maund. I applied to the Eastern Bengal State Railway on the subject but got the stereotyped reply that "Your letter No. of The matter is having attention and I hope to address you again on the subject." Since then no reply although several reminders were sent.

Extract from letter No. 1494-604, dated the 12th July 1911, from the Conservator of Forests, Bengal, to the Imperial Forest Economist, Dehra Dun.

* * * * *

Evodia Frazinifolia is plentiful in the Darjeeling forests where it is considered useless even for firewood. Freight on the Darjeeling-Himalayan Railway is high but if the match factory think they can use the timber at a profit arrangements can be made to supply experimentally a small quantity of the wood if they state definitely what number of cubic feet are wanted and agree to bear the actual cost of collection and transport. Arrangements for a regular supply could be made later if the experiment is successful. I am informing the factory.

No. 1495-604, dated Darjeeling, the 12th July 1911.

Extract forwarded to the Manager of the Bande Mataram Match Factory, Calcutta, for information.

(Sd). C. E. MURIEL,
Conservator of Forests, Bengal.

No. 746-G., dated Darjeeling, the 23rd March 1912.

From—J. W. A. GRIEVE, Esq., Deputy Conservator of Forests, Darjeeling Division,
To—The Managing Proprietor, Bande Mataram Match Factory, 38, Russa Road, South, Tollygunj Post Office, Calcutta.

In continuation of this office letter No. 707-G. of the 8th instant, I have the honour to inform you, in reply to your paragraph 2 of letter of 27th February 1912, that Pakhay Lall and Nandu Sirdars of Sanchal Range, Jore Bungalow, Ghoom Post Office, have agreed to supply you with *Evodia Frazinifolia* at an uniform rate of Re. 0-7-0 (annas seven) per maund delivered on the waggons at Ghoom station. For further communication please address them direct at the abovementioned address.

Dated Calcutta, the 30th November 1912.

From—Babu SAILENDRA NATH MITRA,
To—The Deputy Conservator of Forests, Darjeeling.

I beg to thank you for the two sample pieces supplied by you at the request of my representative. One of them marked "K" and called "Kapashi" will suit me exactly. I am writing to the contractor Nandu and Pakhay sirdar of Jore Bungalow, Ghoom, to take permission from you to fell these trees and send me 500 maunds of this wood by the end of January next. My representative told me that this wood can be had in plenty in the Government Reserve Forest.

Kindly let me know what quantity I can usually get each year of this wood and for how long? I will require about 18,000 maunds each year. I shall be obliged if you will grant me monopoly of this and *Evodia Frazinifolia* wood for a period of twelve years so that these trees may not be used as fuel or for any other purpose.

No. 750-G., dated Darjeeling, the 4th December 1912.

From—The Deputy Conservator of Forests, Darjeeling Division,
To—The Managing Proprietor, Bande Mataram Match Factory, 38, Russa Road, South, Tollygunj Post Office, Calcutta.

In reply to your letter of the 30th ultimo, I have the honour to intimate that this Department cannot give monopoly and that you must buy from sirdars who will, as a rule, have plenty of these woods.

Dated Calcutta, the 8th March 1913.

From—Babu SAILENDRA NATH MITRA,
To—The Secretary, Revenue Department, Government of Bengal.

I beg to inform you that I, in conjunction with Dr. R. B. Ghose, have started a match factory which is being managed by me.

This being a new venture in Bengal I have had great difficulty in finding suitable timber for match making, but after carrying out many experiments and spending considerable sums

of money we have found that the following two woods "Khanakpa" or *Evodia fraxinifolia* and "Kapasi" which I think to be *Trema orientalis* are most suitable for the purpose.

These timbers I can get in limited quantities from the Darjeeling Division, but unless a better arrangement is made I cannot obtain a regular supply of the timber I require. I therefore most respectfully request you to order the Forest authorities concerned to make the following arrangements:—

- (i) To supply me with 15-20,000 maunds of two timbers annually, or to allow my contractor only to fell these species.
- (ii) If the logs are supplied by the Forest Department, to do so at cost price and only charge a nominal royalty or if I am allowed to extract them to be allowed to do so at 6 pies per cubic foot, as is the case with tea box woods.
- (iii) If the logs be supplied by the Forest Department, that they should be not less than 5 feet long, with a midgirth of 2 feet 6 inches with bark on.
- (iv) That an area be set aside for my use in which the two abovementioned species be reserved so that there may be a sustained supply for the future sufficient to yield at least 20,000 maunds annually.
- (v) That I be given a lease in the Darjeeling Division extending over 15 years, during which period I guarantee to utilize the annual supply put at my disposal.
- (vi) That the Forest Department be requested to select the forest in the Darjeeling District for which the lease is to be given.

No. 609—410, dated Darjeeling, the 25th April 1913.

From -C. E. MURIEL, Esq., Conservator of Forests, Bengal,

To—Babu SAILENDRA NATH MITRA, Bande Mataram Match Factory, 38, Russa Road, South, Tollygunj Post Office.

With reference to your application, dated 8th ultimo, addressed to the Secretary, Revenue Department of the Government of Bengal, and which has been sent to me for disposal, I have the honour to inform you that the trees *Evodia fraxinifolia* and *Trema orientalis* do not grow alone but are scattered over the forests.

Under the working plan for the Darjeeling Division trees of all kinds are marked for sale in groups and it is undesirable to have more than one purchaser working in any group. In the groups marked for felling in 1913-14 there are 129 Kapashi trees and 2 Khanakpa mixed up with a much larger number of trees of other species. These trees are all over 4½ feet girth and you require billets of 2' 6" in girth only, so that you would only utilize a small proportion of the trees if they were sold separately to you.

In these circumstances the most convenient and economical method for extraction is to sell the Kapashi and Khanakpa trees along with the other trees in each group and for you to purchase from the contractors, who buy the groups at auction, such portions of the Kapashi and Khanakpa trees as suit you.

2. The Forest Department cannot undertake extraction for trade purposes in the Darjeeling Division nor can a lease be granted to you for the extraction of 2 species of trees growing scattered in small numbers over the forest.

It is open to you to bid at the auction for any group of trees marked for felling.

Dated Calcutta, the _____ 191 .

From—Babu SAILENDRA NATH MITRA, Proprietor, Bande Mataram Match Factory,

To—The Hon'ble MR. P. C. LYON, C.S.I., Member, Executive Council to the Governor of Bengal.

I have the honour to bring to your kind notice that I am the managing proprietor of a match factory which I started in partnership with Dr. Rash Behari Ghose in 1907.

This being a new venture in Bengal I have had great difficulty in finding suitable kinds of timber for making match sticks and boxes. After carrying out many experiments and spending considerable sums of money I have found out that three kinds of timber, *vis.*, Khanakpa (*Evodia fraxinifolia*) Kapashi (*Acer campbelli*) and *Trema Orientalis* and Arupate; all of which are available in the Darjeeling and Kurseong Forests are suitable for the purpose.

In order to secure these I submitted an application on the 8th March last to the Secretary, Revenue Department, and he forwarded the same to the Conservator of Forests, Darjeeling, for disposal on the 19th April.

The Conservator of Forests addressed me a letter on the 25th April last (copy enclosed) from which it appears that he was under the impression that I wanted pieces of timber of 2 feet 6 inches girth only whereas I had stated in my letter that this size should be the minimum. I had the honour to have an interview with the Conservator of Forests on the 5th July last in the course of which I explained to him all that I wanted. He drew my attention to the orders of the Government of India under which he could not supply the required timber.

departmentally. I explained to him that it was not possible for me to rely upon the sirdars for a regular supply of timber for the following reasons :—

- (1) According to the conditions of auction sale they would have some allotted time for felling the trees which arrangement would make it impossible for them to supply me regularly with *green* timber throughout the year.
- (2) There might not be any of the abovementioned kinds of timber in the portion of forest sold to them in a particular year.

The Conservator of Forests kindly further read out to me a note from the Assistant Conservator of Forests, Kurseong, from which I found that a large quantity of the material could be had from the Kurseong Division. I next had a correspondence with the Assistant Conservator, Kurseong, of which I enclose copies herewith.

I humbly pray that the following arrangement may be made by the Forest Department :—

- (i) That steps may be taken for supplying me 20 and 30 thousand maunds of the three abovementioned timbers annually at the rate of 2 to 3 thousand maunds a month.
- (ii) That charges should be made only on the actual cost incurred by the Forest Department in felling, cutting the logs into the required size, carrying them to the station and loading them on the waggon, and that the royalty should be nominal.
- (iii) That the logs should be 5 feet long and with a minimum midgirth of 2 feet 6 inches and maximum 5 feet with the bark on, and these be despatched as soon after felling as possible.
- (iv) That not less than 150 maunds of timber should be loaded in each waggon.
- (v) That the abovementioned species of trees be preserved so that there may be a sustained supply for the future.
- (vi) That the Forest Department should select the forest in the Darjeeling and Kurseong Divisions for this purpose.

I beg leave to suggest that the abovementioned work of felling, gathering and conveying the timber may be effected by contract labour under supervision of the existing staff thus avoiding any permanent increase of establishment charges for additional staff.

It is my further prayer that if necessary the Government of Bengal would kindly represent to the Government of India the desirability of having the orders of the Supreme Government which prevents my having a regular supply of timber departmentally, relaxed in favour of the first industry of its kind on this side of India.

No. 3718-M. R., dated Calcutta, the 16th November 1913.

From—The Hon'ble Mr. H. F. SAMMAN, I.C.S., Officiating Secretary to the Government of Bengal,

To—Babu SAILENDRA NATH MITRA.

I am directed to refer to your undated letter addressed to the Honourable Member-in-charge, which was received on the 13th September 1913. You ask that arrangements may be made by the Forest Department for supplying you direct with three kinds of timber, *viz.*, Kapashi, Khanakpa and Arupate for making match sticks and boxes in the Bande Mataram Match Factory of which you are the managing proprietor.

2. In reply, I am to say that, after giving your letter careful consideration, the Governor in Council regrets his inability to comply with your request. It is true that a consignment of 150 maunds of Khanakpa timber was supplied to the Bande Mataram Match Factory in September 1911 at a very low figure; but that timber was obtained in close proximity to the railway and only the bare cost of felling and transport was charged. I have already been explained to you by the Conservator of Forests, it would be impossible for the Forest Department to guarantee a regular supply at similar rates. Its existing staff would not suffice for the work, and the limitations you set upon the size of the logs to be supplied would result in heavy wastage, which would entail loss on the Department.

3. The most economical arrangement for all concerned is for the match factory to continue as at present to obtain the timber through the contractors who buy the trees in the groups and make use of the whole tree.

4. With reference to your request that the Kapashi and Khanakpa trees may be preserved for a sustained supply in the future, I am to state that the Forest Department does not desire to perpetuate species of such little value, but proposes to stock the forests of the Darjeeling Division with more valuable woods; there will, however, be a varying outturn of Khanakpa and Kapashi for many years to come, and the Conservator of Forests, Bengal, will be glad to keep you informed regularly of the number of trees that will be available each year and to keep you in touch with the purchasing contractors. Such information will usually be available some few months before felling as the markings in groups are done in advance.

Dated the 21st November 1913.

From—Babu SAILENDRA NATH MITRA,

To—The Secretary to the Government of Bengal, Revenue Department, Forest Branch.

I have the honour to acknowledge receipt of your letter No. 3718-M.R. of the 15th instant, and submit the following for your favourable consideration.

The Government appears to be disinclined to comply with my humble request chiefly on these grounds :—

- (1) As regards the rates I beg to point out that in my last letter I did not offer any particular rate high or low for the supply of timber though I incidentally prayed that the actual cost should be charged against me. If however the Government would kindly let me know the rates at which it would be possible for the Forest Department to grant a regular supply I shall be glad even to strain my resources in order to meet the wishes of the Government as far as possible.
- (2) As regards the question of labour necessary for the purpose I suggested in my last that the work of felling, gathering and collecting the timber might be effected by contract labour under the supervision of the existing staff and I have not the least objection to pay any necessary charges on this account. I hope however that no permanent addition to the existing staff would be necessary.
- (3) As regards the size of the logs it is true I entered into some details that would be convenient for my purposes; if however the Department finds any difficulty in observing the details I shall be quite satisfied with a supply of any size provided the minimum midgirth does not fall short of 2' 6."

I may be permitted to mention here that in spite of repeated efforts I have failed to get a regular supply of the requisite timber through the contractors and the prospect of the factory now entirely depends on the beneficence of the Government.

I am grateful for the offer of regular information regarding the trees in question but for reasons mentioned in my previous letter I am afraid that it will not be always possible for me to secure timber from the contractors.

Under the above circumstances I pray that the Government will kindly make arrangement for supplying me with the three kinds of timber, viz., *Khanakpa*, *Kapashi* and *Arupate* direct through the Forest Department.

As regards the Forest policy I do not venture to enter into any discussion with the Government. I am confident, however, that the existing stock of the abovementioned trees will be quite enough for my purposes for several years to come.

No. 4281-M. R., dated Calcutta, the 15th December 1913.

From—J. N. MITRA, Esq., Under Secretary to the Government of Bengal,

To—Babu SAILENDRA NATH MITRA, 94, Bakul Bagan Road, Bhowanipur.

With reference to your letter, dated the 22nd November 1913, regarding the supply of certain kinds of timber for the Bande Mataram Match Factory, I am directed to say that the Hon'ble Mr. Kerr, Revenue Secretary to Government, will be glad to see you in office any day this week between 10 A.M. and 1 P.M.

Dated Calcutta, the 12th January 1914.

From—The Hon'ble Mr. J. H. KERR, C.I.E., I.C.S., Secretary to the Government of Bengal,

To—Babu SAILENDRA NATH MITRA, 94, Bakul Bagan Road, Bhowanipur.

With reference to your letter, dated the 22nd November 1913, regarding the supply to you by the Forest Department of certain kinds of timber from the reserved forests in the Darjeeling and Kurseong Forest Divisions for the Bande Mataram Match Factory, I am directed to say that, after a further careful consideration of your application, the Governor in Council regrets that it is not possible to arrange for the departmental extraction of the timber required by you. But as already promised, Government will assist you, as far as possible, in your dealings with the contractors.

2. I am to add that it has been ascertained from the Conservator of Forests that 5,000 maunds or possibly more, is estimated as the probable outturn of *Khanakpa*, *Kapashi* and *Arupati* timber in 1914 and 10,000 maunds nearly all of which would be *Kapashi* in future years. It must, however, be clearly understood that Government is not in a position to guarantee any minimum outturn, and that while the officers of the Forest Department will be prepared to put you or your responsible agent in communication with the contractors, and to afford you all the information available, it will be necessary for you to make your own arrangements with the contractors as to price and supply.

The following is a note on the pencil factory of the Small Industries Development Company, Limited.

The company was started in 1907 with a subscribed capital of Rs. 83,590 at Rs. 10 each Pencil factory. for 8,359 shares, of which Rs. 52,050 only were realized. Some of the promoters who promised ten thousands of rupees even did not pay for the shares which they put against their name. The company struggled hard to raise the money by selling shares but failed so that they had to borrow money at a high interest.

At first there was difficulty in obtaining suitable wood. Numerous kinds of wood were tried but none seemed satisfactory; the only wood found suitable was Cupressus Torulossa (Himalayan Cypress). We secured this wood from Pandit Sunderlall Pathak, the forest officer of Patiala State, and subsequently through Mr. Pearson, Forest Economist, Dehra Dun, secured a few pieces which when worked seemed to suit our purpose. It was quoted in his book (The Commercial Guide of the Forest Economic Products in India—page 43) Rs. 45 per ton delivered in Calcutta. But when asked to supply the forest officer of Jansuar quoted Rs. 75 per ton. So the cost was prohibitive for our purpose.

After all, cedar wood was found in Baluchistan which was the only source we looked for our supply. But the attached correspondence will show how bitterly we were disappointed by the action of the Baluchistan Government.

The question of freight which is of prime importance unless redressed is absolutely prohibitive to a concern like ours. We wanted the freight to be calculated on the actual weight and not on the marked carrying capacity of the wagon in which it can be put in even filled up to the brim. In bringing cedar wood from Quetta to Kalighat the railway companies charged Rs. 460-6-0 for 220 maunds whereas it took us 30 shillings per ton to bring 6 tons of cedar wood from London to Calcutta.

Re Plastic clay. The Director of Geological Survey replied that it could be found in Lakhi and Kirthar group in Baluchistan and in Gondwana group in Bengal.

Local manufactured products ought to be purchased by the Government and the railways ought to give an impetus to the industries and give them an opportunity. During the last census in 1911, the Controller of Stationery kindly placed with us an order of two lakhs of pencils and gave us one month to manufacture them. We supplied the pencils in the allotted time and to the satisfaction of all concerned as will appear from the correspondence but since then not a single pencil was taken from us. We sent some pencils to Sir T. R. Wynne, the Chairman of the Railway Board, and he was satisfied with the pencils (*vide* his letter, dated 9th March 1911). We approached the E. I. Railway, the premier railway in India, and got the accompanying letter from the Controller of Stores but not a single pencil was taken from us up till now.

Extract from letter No. 370, from Extra Assistant Conservator of Forests, Quetta, dated 25th November 1912.

"Nevertheless for the year 1913-14, the Revenue Commissioner of Baluchistan is willing to allow the cutting of 1,000 maunds of the woods from the dying trees in the last resort provided that the first effort is to obtain the 5,000 maunds required for the pencil supply from dead wood."

Since then 3 consignments of cedar wood came but owing to the heavy freight and the quality of the wood from the dead trees which is chiefly used for fuel and have cracks and insect borings in the centre, it was discontinued.

Then application was made through the Department of Commerce and Industry, to the Government of India, for the supply of live cedar-trees and in reply, No. 8464—41, dated 9th June 1915, appears the following extract:—

"In view of the scanty reproduction and exceedingly slow growth of the Juniper the Government of India regret that they are unable to allow commercial exploitation of the live trees of the Juniper forest. They are asking the Agent in Baluchistan to do his best to secure for the Small Industries Company a reasonable supply of fairly sound dry timber."

Extract from letter No. 160-F, from the Revenue Commissioner of Baluchistan, dated 30th June 1915.

"With reference to paragraph 2 of the letter No. 8464—41, dated 14th June 1915, from the Government of India, Department of Commerce and Industry, to your address, I have the honour to say that the Honourable Agent has already granted a concession for the supply of 5,000 maunds dry Juniper timbers per annum for three years to Professor Godbole of Dayal Singh College, Lahore, and I am afraid it will not be possible to grant you any large quantity of Juniper timber for these three years. If you will let me know your requirements, efforts will be made to try and accommodate as far as possible."

No. 1225, dated 7th February 1911.

From the Controller of Stores, East Indian Railway.

In reply to your letter of the 4th instant, I have to inform you that we do not require the lead pencils at present, the samples submitted by you however appear suitable.

ORAL EVIDENCE, 5TH DECEMBER 1916.

Mr. A. Chatterton.—*Q.* You floated the Small Industries Development Company in 1908. What industries did you propose to take up?—*A.* We started with pencils and buttons at the beginning.

Q. What is the capital of this company?—*A.* The subscribed capital was Rs. 83,590 and we got only Rs. 52,050.

Q. What became of these factories?—*A.* The pencil is going on and the button we have closed.

Q. From what material did you make buttons?—*A.* From shells.

Q. Where was the factory?—*A.* In Calcutta.

Q. You say that there was over-development in the manufacture of soap and there was price cutting. Were these very small factories?—*A.* Very small.

Q. Making an inferior kind of soap?—*A.* There was superior soap also. At first they made the superior soap and then the quality began to deteriorate.

Q. You say that Government ought to take the lead in starting demonstration factories and that they should be handed over to private persons after the experimental stage is over. What do you consider should be the completion of the experimental stage?—*A.* When it is found that articles of good quality are manufactured and the arrangement for raw materials has been made.

Q. Would you consider it not necessary to carry the thing to a commercial success?—*A.* If they have made the right stuff and arrangements for securing the proper raw materials have been made.

Q. That does not prove that the articles can be manufactured commercially. Don't you want to prove that they can be made a commercial success?—*A.* It will prove a commercial success if the articles can be made here.

Q. After the materials have been tested and satisfactory products made from them, don't you want to run the industry for some time and train the Indian manager and the workmen?—*A.* I have said that all these managers and foremen should be taken into the demonstration factories to learn part of the work.

Q. With reference to the industrial bank you propose that the management should be one half nominees of Government and the other half elected by the shareholders. How do you propose that the money should be invested? Who is to advise?—*A.* The directors.

Q. Do you propose that the directors should be experts in industrial matters?—*A.* Not in industrial matters. They would advance money in a businesslike way.

Q. If there is an industrial bank started the directors will want expert advice as to the investment of the money?—*A.* They can see the balance sheet of the concern and act accordingly.

Q. Is that the only criterion? In some cases the more money that is advanced the greater will be the risk involved?—*A.* Not in that way. For instance, I have a pencil factory and I want some additional machinery and I want some money, in that way I mean.

Q. You suggest that there should be a technical institute for Bengal and that the Director should be a high class scientist who should be engaged for a certain number of years, for a fixed period. What do you mean by fixed period?—*A.* For a certain number of years, say 5 or 8 or 10 years.

Q. What is the object in limiting the time?—*A.* You may not get good men coming out if you do not fix the period.

Q. Then you suggest that the technical institutes should be intimately associated with the Director of Industries whom you propose should be created and the governing bodies of the technical institutes should be advisers to the Director. Is that your idea?—*A.* Yes.

Q. Was the Bande Mataram Match Factory one of your concerns?—*A.* That was started by myself and Dr. Rash Behari Ghose.

Q. What became of this match factory?—*A.* It is closed now.

Q. And the machinery?—*A.* It is lying there.

Q. Why was it closed down?—*A.* Simply because we could not get the wood. We could not get the wood from the Government forests as we expected.

Q. What made you locate this factory in Calcutta?—*A.* I was advised by the Forest Economist that Calcutta is the best place. I have referred to his publications.

Q. You made no other attempt to get wood from any other place except the Darjeeling hills?—*A.* Darjeeling is the nearest forest where suitable wood is available.

Q. Putting your factory in Calcutta you had to meet with a very severe competition with imported matches?—*A.* I had to face competition with Swedish, Austrian and German matches.

Still I used to sell them at a lower price. My price was 10 annas and theirs was 12 to 18 annas.

Q. Did you not get wood from the United Provinces or from the forests further North?
—*A.* The railway rates would be prohibitive and especially for the match industry you want green wood, dry wood would not do.

Q. Have any applications been received for the sale of the machinery?—*A.* I have not received any. Mr. Swan made the enquiry and he assured me that he would try to get the wood for me.

Q. No steps have been taken by Mr. Swan?—*A.* Nothing of the kind.

Q. When you started this factory what class of boy did you get to do the work?—*A.* Boys of 8 and 10 years. I employed about 40.

Q. In regard to education was your factory working long enough to form any judgment as to the qualifications of the boys that you wanted in matters of general education?—*A.* Some of them did not know how to read and write.

Q. How long were you running this factory?—*A.* From 1908 to 1913.

Q. Did you find that boys who received elementary education took to the work better than those who had no elementary education?—*A.* Those who had no education took to the work more easily.

President.—Q. Whom do you find more efficient, boys who have had some education or those who have not had any education at all?—*A.* The boys whom I employed in my factory had very little education.

Q. You were not able to get boys with some education?—*A.* No.

Q. You do not mean to say that education is a disadvantage?—*A.* Certainly not.

Q. Have you had any practical training in match making?—*A.* No.

Q. You brought out a German to run the factory?—*A.* Yes.

Q. Was he an expert match maker?—*A.* Mr. Roller sent him out.

Q. You have no idea of whether this man was a first class technical man or only an ordinary workman?—*A.* He did his work well and trained many of my boys.

Q. So your real trouble was the supply of suitable wood?—*A.* Yes.

Hon'ble Pandit M. M. Malaviya.—Q. How many match factories are there working in India?—*A.* There are two only. One at Ahmedabad and one at Bareilly.

Q. And one at Kotah?—*A.* That did not work regularly.

Q. What is the total quantity of matches imported?—*A.* That I cannot tell you.

Q. There is need for more match factories?—*A.* Certainly.

Q. What is the amount of capital that you invested in your factory?—*A.* One lakh of rupees.

Q. You say as regards freight that the Eastern Bengal Railway replied that the matter was receiving their attention and that they would address you shortly. Have you received any communication?—*A.* That is the only letter which I got.

Q. So far as the machinery and the workmen were concerned you had no difficulty, your chief difficulty was suitable wood. You failed to get that in spite of your best endeavour. You have no complaint to make as regards the information contained in the Government publications about this being a suitable centre for a match factory. It is only with regard to the getting of wood that you found difficulties?—*A.* Yes. The wood was the only thing that stood in the way.

Q. Did you not write to the Commerce and Industry Department?—*A.* I did not.

Q. I wish you had done so?—*A.* I should probably have got the same reply from them as well.

Q. I can assure you that you would have received a more helpful response from Mr. Low. As regards the pencil factory, you were not actually misled by the information given in the Commercial Guide. But the practice did not conform to the information given there. It was probably the fault of the particular officer concerned. You cannot say that the information misled you. It may be right?—*A.* It may be.

Q. The pencil factory has been a success?—*A.* Yes.

Mr. C. E. Low.—Q. When did you start your match factory?—*A.* I began in 1908 but actually worked from 1909.

Q. Don't you think you would have been wiser if you had begun by going about and seeing as to the quantity of timber that is available?—*A.* How can I do it.

Q. You speak about the getting of the classes of timber you require out of the forests through special contractors. The Forest Department sell a certain area. If they get anybody else working in the coupe the regular contractor will accuse him of stealing and the former would not give so high a price for the coupe. The regular contractor on the other hand if he gets all that grows in the area will try to make the largest possible profit he can out of any one who wants to purchase. Have you any suggestion for overcoming this difficulty?—*A.* I think the coupes may be so arranged so that a certain number of trees may

be felled every year. Mr. Muriel pointed out that they were sold in blocks. In one year I shall get only a few trees of the kind I want. In other years I shall get more. I suggest that so many trees should be made available in every year.

Hon'ble Fandit M. M. Malaviya.—Q. If the Government help you to obtain the wood you require, are you ready to start the factory at once?—A. Yes.

Q. You do not think there will be any other difficulty?—A. Difficulties about paper will arise.

Q. That will be temporary?—A. I do not know whether it will be temporary or for good. All the papers I use to get from England. As regards chemicals, Messrs. Waldie and Company have promised to supply me if I will require them on a large scale.

Hon'ble Sir Fazulbhoj Currimbhoy.—Q. In reply to one of the members of the Commission you said that you could work this match factory with profit if you had the wood. What price are you prepared to pay?—A. I agree to pay 7 annas a maund.

Q. That is a concession?—A. Not a concession. The actual price was, I believe, four annas a maund. The two waggon loads which the Forest Department supplied me came to only 4 annas a maund including royalty, the felling charges and the cost of bringing the wood to the railway station.

Q. How much is the cost of the wood and how much the other material? Can you tell the percentage roughly?—A. For chemicals you want three annas. For wood 3 annas 6 pies and for paper labels and all that 9 pies. My cost of production was 9 annas per gross. I was selling at 10 annas.

Q. How much money have you put in?—A. A lakh of rupees.

Q. Have you got the men and the machines?—A. Yes.

Q. In the industrial bank suggested if instead of Government subscribing the capital, suppose the Government guarantees interest. Don't you think the public will subscribe?—A. At the present moment the Government ought to subscribe. Otherwise the public would not.

Q. If the Government guarantees 5 per cent?—A. Then money will come in. If Government guarantees 4 to 5 per cent. then money will be forthcoming in Bengal.

President.—Q. Referring to this correspondence that is printed with your evidence, do you object to our sending it to Government?—A. I have not the least objection.

Q. We will send it to the Government of Bengal and ask them if they have any explanation of the apparent failure to supply wood. Will you come and see me early in the new year after our return from the Central Provinces?—A. That will suit me very well.*

Sir D. J. Tata.—Q. With reference to those boys of 8 and 10 who work in the factory do you think that the town-bred boy who has received a little education is apt to be more disinclined to work than those who have no education and who come from the rural parts?—A. I think both of them work with their hands at the machinery.

Q. The moment a boy gets some education he is inclined to be lazy?—A. By little education I mean only reading and writing. That makes no difference. Our mistries are all getting Rs. 40 and Rs. 50. They all know to read and write. They do not complain of anything.

Q. My experience has been that town-bred boys are apt to be a little lazy, and they are not inclined to work as hard and such long hours as the others?—A. Of course it is so. But the boys whom I employ are all town-bred boys.

* *Note.*—The records of the Government of Bengal, which were kindly placed at the disposal of the Commission, showed that no guarantee of an annual supply of 5,000 maunds of timber suitable for matches had been given.

*Lt.-Col. Sir
Leonard Rogers.*

WITNESS No. 111.

LIEUTENANT-COLONEL SIR LEONARD ROGERS, I.M.S., *Professor of Pathology, Medical College, Calcutta.*

WRITTEN EVIDENCE.

I fear that I have no expert knowledge regarding the testing of drugs made in India. I am however interested in some questions regarding the cultivation of certain medicinal plants and the manufacture of important drugs from them, and submit the following views thereon.

Facts of evidence.—CINCHONA PLANTATIONS AND THE MANUFACTURE OF QUININE.—Government cinchona plantations and quinine factories exist in the Darjeeling hills and in Madras, and I have recently visited the former with Major Gage, I.M.S., the Superintendent. In a report on the prevalence of fevers in the Dinajpur District of Bengal in 1904, I drew attention to the utter inadequacy of the seven dispensaries and forty post offices among 1,500,000 inhabitants of that intensely malarious district to distribute enough quinine to have the slightest effect on the disease, and noted that the stock of quinine in the dispensaries was utterly inadequate, in one of them there having been only six drachms—barely sufficient to treat two cases of malaria—at the time of my visit and I suggested utilising the village school master to supply quinine to the children, who are by far the greatest sufferers from the

disease. I understand that as a result of that report the cinchona plantations were considerably extended in the Darjeeling hills and the outturn of quinine has been greatly increased by Major Gage, who has built up a considerable reserve. The sale of quinine in Bengal has considerably increased during the last few years under the Provincial Malaria Committee and the Sanitary Commissioner. The last report of Major Gage showed that the cinchona plantations have been a financial success, so their further extension appears to be advisable, as only the fringe of the great question of an adequate supply of quinine for treating the millions suffering from malaria in India has been touched, and the economic loss due to the weakening of the population in Bengal and other malarious parts of India is incalculable.

IPPECACUANHA AND EMETINE.—It was only in 1902 that I pointed out that amœbic dysentery is the common form in Bengal, and that ippecacuanha, which had previously been used in all kinds of dysentery with very varying results, was a specific in the amœbic form, but useless in other forms. In 1907 I showed that tropical liver abscess can be prevented by the use of ippecacuanha in the early febrile stages, and which has led to the very great decrease in the prevalence of that disease. In 1914 I discovered that soluble salts of emetine were very much more effective than ippecacuanha by the mouth, which it has since almost entirely replaced. Owing largely to the war, the price of emetine has gone up very greatly, as Government required so much for Gallipoli and Egypt, but even before the war the Government of Bengal did not supply the drug in anything like sufficient quantity for many of their hospitals, including the Campbell hospital with several hundred dysentery patients a year with 40 per cent. mortality. During one year I supplied the drug through a grateful patient, and greatly reduced the mortality, but the rate has gone up again since my supply ceased. The diet of the patients during the extra time they are in hospital for want of emetine is doubtless much more costly than the drug, so this policy appears to me to be as unsound as it is inhumane. At my suggestion Major Gage has been cultivating ippecacuanha for some time, but two or three years will elapse before he can make emetine on a sufficient scale to supply even a small portion of the needs of India. The total alkaloids of ippecacuanha can be prepared at a small fraction of the cost of pure emetine hydrochloride, and my experience on protozoa and in cases of amœbic dysentery lead me to believe that it will be nearly as efficient, in which case the problem will be greatly simplified. India and other tropical and sub-tropical countries will not reap the full benefit from the discoveries leading to the great advances in our methods of treating amœbic dysentery and hepatitis until Government can supply the necessary drugs in ample amounts to all their hospitals and dispensaries and sell it at a cheap rate to medical practitioners.

OIL OF CHENOPodium.—This drug has recently been shown to be very effective and safe in hook-worm disease, so it may well replace the now very expensive and more depressant thymol and beta-naphthol. Major Gage at my suggestion has just commenced to grow it. The oil at present comes from America and is expensive.

The above are examples of drugs which are especially required in the treatment of widely prevalent tropical diseases of India, the preparation of which on a large scale by the Government of India would be of great advantage to the country. One reason why a large reserve of quinine should be kept in stock is for use during such epidemics of malaria as that which caused very great loss of life in the Punjab in 1908, much of which might have been prevented by a wider free distribution of quinine as a special measure, on the same principle as famine relief works; for such epidemics follow excessive rainfall and their epidemiology is sufficiently understood to allow the sanitary department foreseeing them in time to take measures to save many lives, which would be much more useful than publishing and discussing voluminous statistics based on absolutely unreliable data, such as most of the vital statistics of the civil population of India.

PHARMACOLOGICAL INVESTIGATIONS.—At the present time there is no professorship of pharmacology in India, and no material amount of investigation of drugs has been carried out in this country. One such post has been sanctioned for the Calcutta School of Tropical Medicine after the war is over. The fact that emetine was known for over eighty years before its therapeutic value in amœbic dysentery and hepatitis was discovered will suffice to show the importance and need of such work. There are many Indian indigenous drugs requiring scientific investigation, our knowledge of the chemistry of Chaulmoogra oil, the best known remedy for leprosy, for example, being still elementary, although it is now being investigated for me with the help of a grant from the Indian Medical Research Fund, while I have recently obtained a generous donation of half a lakh from the Maharaja of Darbhanga for work at indigenous drugs.

ORAL EVIDENCE, 6TH DECEMBER 1916.

President.—Q. I understand that a great deal of your activity has not immediately been concerned with our objects, but is concerned with the manufacture, on a large scale, of drugs that might be made sufficiently cheap and available to the people of India, in order that the other work that you have done may be turned into account. Apart from the investigation of the physiological and therapeutical action of drugs, and apart also from the distribution of knowledge concerning their uses, can you suggest a scheme for extending their manufacture in India?—A. They have the nucleus at Serail in the Darjeeling hills and can do a great deal more. They are growing ippecacuanha to make emetine, which is only

secondary in importance to quinine itself. I was there recently, and was told that emetine was made practically in the same way as quinine. They have got everything there for making a great deal. More of it might be done especially regarding those drugs which are required for tropical diseases. At the present time the price of emetine has gone up enormously, owing to the war, mainly due to Government having taken most of the supply for Egypt and Gallipoli. At the present time you cannot get emetine at any reasonable price. If it was manufactured and kept in stock at Serail, the matter might be remedied.

Q. Do you hope that we shall be able to manufacture the alkaloids of ipecacuanha, without regard to separating the emetine itself?—A. Yes, I have been testing this recently. They have extracted experimentally the total alkaloids, and can prepare that at a quarter of the price of pure emetine, and I find from my experiments that it is only very little less effective.

Q. Apart from the price, would there not be some delay in setting up appliances to manufacture pure emetine, and would we not obtain sufficiently good results if we manufactured the mixed alkaloids from ipecacuanha?—A. They can do both; they can manufacture the emetine; they have got everything there at the present time, but the difficulty is that the supply is insufficient for the needs of all the hospitals, at a reasonable price. I think they should manufacture pure emetine and also the alkaloids.

Q. You also mention chenopodium. Do you hope that will be manufactured?—A. Yes, Major Gage is taking that up and is growing it. It has really not been touched out here. At the present time investigations are being made by the Rockefeller Institution in America, and at Darjeeling and Ceylon. Chenopodium has been found superior to thymol and beta-naphthol.

Q. Does this hook-worm disease occur in mines in Bengal?—A. I am certain it does, because it occurs in the deep mines in California, where you get similar conditions. It has never been investigated at all. I shall get twenty thousand rupees a year from the Mining Association for research in the School of Tropical Medicine after the war which I intend to devote mainly to this work.

Q. Are there not many other drug-yielding plants now exported which could be used in the country?—A. Yes, the Director-General, Sir Pardey Lukis, sends an official witness to take up that point. Opium of course is being made, and the alkaloid from caffeine is very important. Thymol is now being made at Dehra Dun and wants extending. Belladonna and asafoetida, and also the sandalwood oil are all available in large quantities in India and could be manufactured here to great advantage.

Q. I suppose sandalwood oil is much cheaper now that it is being manufactured in India?—A. It ought to be.

Q. It is no use making these things in India if we do not make them available?—A. Yes.

Q. For the manufacture of most of these are not the appliances comparatively simple and the processes of a kind that could be designed by fairly good chemists?—A. Yes, I believe so. I have not much practical experience of it. That is what I understand.

Q. Do you think that any real harm is being done to the health of the people by the uncontrolled sale of patent medicines?—A. Yes, most certainly, as there are no arrangements for testing drugs. I have often heard physicians say that a lot of drugs are imported which are of no value, and no control is exercised over them. I find this a great handicap in medical work.

Q. Does that interfere with honest enterprise in making cheap drugs?—A. Yes, it would interfere with cheap drugs.

Q. In that case would you have these drugs manufactured by Government or by uncontrolled private enterprise?—A. If not manufactured by Government, they should be tested by some Government official to see that they are up to standard.

Q. If they are not manufactured by Government, in what way would they become available to people except at prohibitive prices?—A. They would have to compete with manufacturers at home, and unless they manufacture at reasonable prices, I don't think they would get a sale.

Q. In that case there would be a temptation to adulteration?—A. Yes; as a matter of fact Major Gage told me that he got quinine from Germany because it was cheap. In purity it was not as good as Government of India quinine.

Q. Some of these drugs are scattered through dispensaries. Are these dispensaries free to the public?—A. Yes, all the district dispensaries are free, and many people go there who can afford to pay.

Q. Do you think that either Government ought to pay the manufacturer and seller, or purchaser and seller of drugs that are relied on as cures for special complaints?—A. Yes, that would be a good plan.

Q. Have you heard of any difficulties connected with the application of anything like a Drugs or Food Act to prevent adulteration? You know what difficulties stand in the way of the administration of such an Act?—A. I think it would be very difficult in this country; but it is certainly badly wanted.

Q. I want to know whether, in view of the difficulties in administering such an Act, if, instead, it would be practicable and advisable for Government to undertake the manufacture of

these drugs, or, which is the same thing, to undertake the purchase and distribution of these drugs. From the point of view of the public health, it is important that this question should be met either one way or the other, by a definite Act recognising the sale of these drugs, or some administrative measure of the kind suggested?—A. I think it would be a great advantage. Medicine has often done a great deal of harm by the drugs not being efficient, and has consequently been brought into disrepute.

Q. And there are many lives lost through drugs of the right quality not being available?—A. Yes. In one of the biggest hospitals in India they found that the quinine was not acting efficiently, and when it was analysed, it was discovered that the dispenser had only put in half the proper quantity.

Witness here added—

Chaulmoogra oil is rather important, because an attempt was made to corner it by a railway doctor recently, in which case Government would have had to pay through the nose for their own products. That corner has been broken now.

Mr. C. E. Low.—Q. You have seen instances in which there was considerable diminution of efficiency in labour employed by large industries, owing to the presence or outbreak of various forms of disease. You are no doubt aware of the recent epidemic of fever in coal industries which occur in epidemic areas?—A. Yes, and also in the Punjab in 1908. I refer to it in my note.

Q. I was continuing the question to persons employed in organised industries. Is it possible to forecast the occurrence of an outbreak of malaria in epidemic areas?—A. Yes, certainly it is by meteorological data. The Sanitary Department spend a great deal of time in investigating that. In various parts of India they work out charts showing definitely in each district conditions which lead to epidemics, it is very different in different parts of the country.

Q. I suppose that a free and well distributed supply of quinine would not of course be a fundamental remedy, but would meet the occurrence of such epidemics which threatened to endanger the output of industries of the importance which coal possesses at present?—A. Undoubtedly it is far the most effective method of dealing with the difficulty.

Q. Can you give us any idea of the scale on which it should be taken, for instance, in an area occupied by the coal industry?—A. Of course the ideal method is if you can give it to the men as a prophylactic. That would require 5 grains per day for each worker. That would almost entirely prevent an epidemic.

Q. You would apply it at a period during which you anticipated the outbreak of the disease?—A. Yes, and you would certainly save nine-tenths of your labour, and it would pay you over and over again. I think Government should have regular systems of distribution of the drug, on the same principle as famine relief works.

Q. Has this matter been brought before the Mining Association; have they undertaken to purchase the quinine and distribute it?—A. I hope this epidemic will lead them to do so. There are several lakhs worth of quinine in Serail. The Home Government wanted to take the whole lot, but it could not be given up. They sent a large quantity to Mesopotamia. There is a scheme under consideration for an enormously increased outturn.

Q. Supposing the Indian Mining Association decided now to carry out a big prophylactic campaign, under existing conditions, would the quinine be available?—A. At the present time there is a large amount available, and there will be an increasing amount every year.

Q. Have you had any experience of the conditions under which medicinal plants grown in Government Forests and yielding drugs, are procurable by would-be manufacturers?—A. There is the *Taraktogenos Kurzii*, yielding chaulmoogra oil, which grows wild in Assam and Burma, and which is let out by Government to anyone who would take the output.

Q. You understand that a manufacturing capitalist in Calcutta or Rangoon might find it extremely difficult to arrange for the physical exploitation and collection of such plants?—A. The Forest Department collect it.

Q. Departmentally?—A. I don't know. They let out each forest. Smith, Stanistreet and Company, for instance, are doing a great deal in that. They are the biggest manufacturers.

Q. You have no views which you would like to express on the general question of assistance which the Forest Department should give in collecting plants?—A. I am not in a position to speak of that.

Q. With reference to plants which may not be found wild in sufficiently concentrated amounts to be available for exploitation, you have to grow them; that is being done at present, I suppose by the Botanical Survey?—A. Yes.

Q. Has the assistance of the Agricultural Department ever been solicited for that purpose?—A. Not that I know of. The botanists here have all the knowledge they want without that.

Q. The Agricultural Department has considerable experience in organising labour, etc.?—A. They might be utilised in that way.

Q. Hon'ble Sir R. N. Mookerjee.—Instead of allowing Government to make the drugs and restrict private enterprise, for the purpose of assuring the purity of these things, don't you

think that it would do equally well if an Act was passed to the effect that every medicine and drug exposed to public sale should be certified by Government?—A. That would be very difficult. At the present time Government have factories working on the manufacture of quinine, and have all their preparations for making emetine, and to take all this away and give it to private enterprises would be a difficult thing. The difficulty is that the price varies at different times. A few years ago quinine was exceedingly cheap. Government laid in enormous stocks and now they are reaping the benefit. Where you have drugs like quinine and emetine, which is required in large quantities, Government manufacture would regulate the price.

Q. The Government move so slowly; take, for instance, the case of emetine?—A. They started emetine in 1912. There was no loss of time after the discovery by me. I think Government should undertake all those important drugs for which there is an enormous demand and upon which the health of so many lives depend.

Q. You said that some German quinine came here. Is there no check on such importations?—A. No, there is no check on imported drugs. That is one of the things required.

Q. Every foreign drug should be certified before being sold?—A. Yes. It has frequently been stated in my presence that a very large proportion of drugs imported into India was absolute refuse, and that no check was put on it.

Q. More strict check is wanted now for those imported goods than those manufactured here?—A. Government are only manufacturing quinine. I am talking about the whole of the drugs.

Mr. A. Chatterton.—Q. In reference to the list of drugs, is there any risk of deterioration if these are manufactured in large quantities and stored?—A. Not if you get the pure alkaloids. They will keep indefinitely under proper conditions.

Hon'ble Pandit M. M. Malaviya.—Q. Is the number of qualified practitioners in this country anything like sufficient to meet the needs of the people?—A. There is room for plenty more, but the people are so poor that they cannot afford to pay a proper qualified man.

Q. In order to have medicines tested before they are allowed to be sold, a big establishment would be necessary?—A. A lot could be done in the chemical laboratory of the Medical College. They do a lot of analyses for the Customs Department.

Q. Your remarks about tests apply only to foreign importations?—A. If there are any firms manufacturing drugs in India, their products should also be tested as well.

Q. What establishment do you think you would require for the purpose even in principal places like Calcutta, Madras and Bombay?—A. I could not give you any definite information.

Q. It would be very large?—A. No, not so very considerable. The chemical laboratory did the whole of the Customs work, Calcutta, for many years.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. About thymol, would there be a large consumption in the country, if produced?—A. Yes, there ought to be, only we have got two other drugs as efficient for the same disease.

Q. At present I hear that thymol is being exported instead of being used in the country?—A. It is being used in this country too.

President.—Q. Even if a drug could be imported of good quality, it could be adulterated after importation. With reference to this question of establishment required to undertake testing, would not a smaller establishment be required for that purpose if Government were wholesale manufacturers. Then the drug could be examined and passed in large quantities instead of selling it, say, in bottles?—A. Yes, that would be so.

Q. So far as it goes, that would be an argument in favour of Government being wholesale dealers?—A. Yes, especially in the case of drugs of especial importance in India.

Q. That would not get over the difficulty of adulteration after it has passed into the hands of the retail dealer?—A. You cannot get over that.

Q. You would still have to undertake legislation in order to penalize any adulteration of drugs?—A. Yes, that should be done.

WITNESS No. 112.

Mr. W. H.
Everett.

MR. W. H. EVERETT, Officiating Superintendent of Industries, and Inspector of Technical and Industrial Institutions, Bengal.

WRITTEN EVIDENCE

Q. 15.—(Witness gave confidential evidence.)

Qs. 19 & 20.—I am inclined to favour the establishment in Calcutta, or a permanent exhibition of machinery and processes, in which power, supervision and labour would be provided for the working of the machines and processes at certain times for purposes of demonstration. Some of the exhibits might illustrate improved machinery for dealing with,

existing industries, while importers, manufacturers and others would be given every facility for the exhibition of new industries or processes. If a technological institute is to be created, the exhibition might be attached to it. Similar working exhibitions are successfully established in some towns in Europe.

Q. 22.—So far as possible, researches relating to Indian questions should be conducted in India. But cases may arise in which help from England would be desirable, e.g., on account of men in that country having special knowledge or experience of allied questions, or on account of special apparatus or appliances not readily obtainable in India, or where important and elaborate investigations are already being made in England into questions at issue and these investigations can easily be extended to cover Indian conditions. Research abroad.

Q. 24.—I have not yet seen particulars of the Advisory Council for Research. In India a body for similar purposes would be useful. The Council here might comprise the heads of scientific departments (Geological, Botanical, etc.); officers deputed by the heads of the Forest Department and Public Works Department (preferably men who have made their mark by special investigations at the Forest Research Institute or elsewhere), and a few others, including educational officers, who have carried out experiments or tests bearing on industrial subjects. They might have a formal list of "correspondents," giving particulars of the subjects or parts of subjects of which each has special knowledge, the list being arranged under subject headings and also under provinces. Any question that is sent to the Advisory Council could then be readily referred to selected authorities for opinion and perhaps eventually for further investigation by one or more of the correspondents. Or, alternatively, these correspondents might be styled Members of the Advisory Council, and the heads of scientific departments, etc., might form the committee, and be chairmen of the various sections. Probably most of the work could be done by correspondence, or by meetings of a few selected members residing in the same district or province, so that unnecessary travelling might be avoided. Commercial museums.

Q. 28.—I consider that the Calcutta commercial museum is a useful institution, though owing to its naturally not being exhaustive, I have, in one or two cases, not been able to obtain there information that I required for answering enquiries, and I have had to make enquiries independently. As opportunity offers I do what I can to procure additional exhibits and information for the museum.

Q. 45.—In the mechanical engineering industry the workshop is the best place for training the operative. But in Calcutta the supply of skilled artisans is far short of the demand, and firms are unwilling to train raw hands, who may leave them for another firm as soon as their services begin to be of value. This appears to be a case where Government might well help the industry by giving lads a comparatively short course of training in handicraft in a special workshop. The course should be based on the requirements of local firms,—to be ascertained by consultation with these firms. Such classes could not, of course, bring in any considerable financial return by sale of work, and the effectiveness of the training should alone be considered. It has recently been found in England that sufficient initial training for raw hands, to enable them to operate the simpler machine tools in munition works, can be given in a very few weeks; and probably six months or less would be long enough for the Indian courses here suggested. The cost, initial and recurring, of such classes would obviously be considerable; but there appears to be an immediate and extensive demand for lads with some such training; and the engineering industry is fundamental to many other industries. Training of labour and supervision.

Q. 49.—I have been on the committee of the Calcutta technical night school since 1912 and have seen the classes at work from time to time. This school is financed by some of the chief local engineering firms and the East Indian Railway, and receives an annual Government grant of Rs. 2,000. There is an attendance of about 60, consisting almost entirely of apprentices, European and Indian, employed in works, railways, the mint, etc. The classes are now held in rooms at the free school after school hours. The teaching could, of course, be greatly improved if there were a technical institute in Calcutta, whose staff, rooms, equipment, etc., could be utilised. But I consider that useful work is being done, even under present conditions, especially in machine drawing. The inferior educational qualifications of most of the lads, specially in mathematics, hamper the teaching in some subjects and retard progress. Industrial and other schools.

Q. 50.—Industrial schools should, I think, be under the Education Department, just as mining education in Bengal is under the Education Department though guided by the Mining Educational Advisory Board on which the mining department is strongly represented. This system works smoothly and efficiently. Another example is the training of civil overseers in Bengal, which is supervised by the Joint Technical Examination Board but is worked by the Education Department. If industrial schools are to be under the Department of Industries, Sibpur College and Dacca School of Engineering would be partly under this department and partly under the Department of Education. Again, would full-time mechanical overseer classes be under the Education Department and similar but part-time classes for apprentices be under the Industries Department?

Q. 56.—(Witness gave confidential evidence.)

Q. 77.—The encouragement offered to educational officers of Government in this direction under general orders is suitable, except that I think higher pay than two-thirds might be offered. Study of foreign methods.

Q. 80.—The facilities offered hitherto at the Calcutta Government Commercial Institute are most inadequate. This has long been recognised by the Board of that Institute, who addressed Government some three years ago on the subject. The question was then postponed by Government, but, on a recent representation from the Board, the appointment of a highly qualified European Principal has been recommended by the Bengal Government to the Government of India. As soon as this appointment is made it is intended greatly to improve and develop commercial education in this province.

Hydro-electric
power surveys.

Q. 102.—So far as I know, the only enquiries made have been in connection with the minor local schemes, *e.g.*, for the electric supply of Darjeeling, Kurseong, etc. I think that a comprehensive survey should be made to ascertain the possibilities in Bengal and, if possible, in adjacent native states, *e.g.*, Sikkim, Bhutan, those adjoining Assam, and those of Orissa.

Railway freights.

Q. 97 and 103.—In a case regarding the selection of a suitable timber for jute-mill bobbins, I was informed by the manufacturing firm concerned that the Forest Department had given them every possible help in their investigations and that all they needed was favourable rates for freight, as to which they were enquiring from the Railway Board.

ORAL EVIDENCE, 6TH DECEMBER 1916.

President.—Q. You say that “you have not yet seen particulars of the Advisory Council for Research. In India a body for similar purposes would be useful. The Council here might comprise the heads of scientific departments (Geological, Botanical, etc.), officers deputed by the heads of the Forest Department and Public Works Department (preferably men who have made their mark by special investigations at the Forest Research Institute or elsewhere), and a few others, including educational officers, who have carried out experiments or tests bearing on industrial subjects.” If your Council comprises such a large number of interests, it would, of course, become very large. This question has been considered at home, and they have decided that it is better to have a small Council, and under that Council a large number of specialised sub-committees dealing, either with special subjects, or natural groups of subjects. That would prevent the Council becoming a sort of Parliament, and it will then practically limit its operations to a careful selection of the members of sub-committees and to adjudicating between relative claims when there is only a limited amount of money to meet proposals for research. This question at home has supporters for both sides. Would you prefer in this country a small Advisory Council for Research, together with a large number of small sub-committees dealing with specialised subjects?—A. I think on the whole that would probably be the best machinery. In my note I have suggested a somewhat similar scheme as an alternative to the other.

Q. Of course when you begin to recognise all the subjects that are necessary, they are just as numerous here as they are at home, and to get them properly recognised, it would have to be a great body. If you had all the interests represented, it might result in many not being satisfactorily handled?—A. I quite agree.

Mr. C. E. Low.—Q. With regard to the proposed technical institute in Calcutta, and the industrial institute at Dacca, I think I am right in saying that it was proposed that they should undertake what I might call industrial research to some extent?—A. Yes, that is, combine research and teaching.

Q. They would work under the Education Department?—A. That was our suggestion.

Q. Do you think the Educational Department a suitable organisation for superintending industrial research?—A. At that time no separate industrial department was contemplated.

Q. Supposing there were a separate Industrial Department?—A. I think probably then it might be desirable that the two should co-operate. Of course there are difficulties.

President.—Q. That is not an answer to the question. Which should it be, one or the other?—A. I have not considered the question* really from that point of view. It strikes me that, even if there is to be an Industrial Department, it would be better to have the institute under the Education Department.

Mr. C. E. Low.—Q. As you say yourself, it is very difficult to have part of a certain institute under one department, and another under another department. Don't you think that makes the present conception of the institute somewhat difficult to carry into effect? If you have research carried on in a technological institute which is to be under the Director of Industries and the rest of the work is under the Education Department. Don't you think it would call for some alteration in the scheme?—A. Certainly if the scheme is to be brought under the Director of Industries. At that time it was not contemplated to have separate departments.

Q. The present industrial schools in Bengal are somewhat numerous, aren't they? Their inspection is a fairly heavy job?—A. Yes.

Q. Would you give us an idea how many there are?—A. Somewhere about 50 big and small.

Q. What happens to the boys taught in these industrial schools?—A. We have had reports prepared in the case of a number of schools, and a good many become mistries afterwards. In some schools a considerable proportion become mistries and in others many of them

* See also additional written evidence printed after oral evidence.

get other jobs. Many leave before the course is finished, not having been properly trained, and drop their practical work.

Q. Is there any organisation for placing these fellows in jobs where the improved methods would be of assistance to them?—A. It is left mostly to the Superintendent of the school. He does what he can.

Q. Is the organisation reaching beyond the school itself?—A. No, but in some cases I have drawn attention to facilities for placing boys in railway workshops.

Q. But there is no organised connection between these schools and the various industries that may employ them?—A. No.

Q. What are they teaching in these schools; are they teaching indigenous methods or improved methods?—A. There are so many schools that it is hard to speak generally. Some of them are mission schools, some Government, some District Board schools. The general idea is this; for example, taking the carpenters' and smithy classes, we get the best mistries we can as instructors. We give them an extra training at Sibpur workshops, if possible, and do the best we can for them. Another point about the school is, we try to give the boys a little training in mechanical drawing, and very simple workshop accounts.

Q. Are you training for organised industries, or for village industries?—A. Mainly for village industries. Some of the lads do join railway workshops afterwards; the majority set up on their own account or under local employers.

Q. Are the schools primarily designed to give villages a better class of carpenters or blacksmiths?—A. Yes.

Q. Are the tools which they are taught to use such as they can buy afterwards, and are they suitable for use on village work?—A. Yes, as much as possible we try to encourage methods and tools which they can use and which are not beyond their means to purchase. They are taught to work both at the bench and sitting on the ground, and in the same way they are taught to use ordinary lathes and also the primitive lathes which village mistries use.

Q. For instance, take the common use of the saw, which is used one way by an English workman and the mistry here who has been trained, and entirely differently by the village carpenter. Which way do you teach them to saw?—A. In the English way.

Q. With of course an English saw?—A. Yes.

Q. Have you any knowledge how far they keep that up when they go back to their villages?—A. I cannot say.

President.—Q. Do the carpenters take with them a box of improved tools when they leave the schools?—A. They are encouraged to purchase them, and in some cases tools are purchased for them with the aid of bonuses earned by their work on outside orders executed at the school. At Faridpore school there is a skilled European *padre* who encourages them to get a set of improved tools.

Mr. C. E. Low.—Q. Is there a fund for assisting them to purchase improved tools?—A. In Government schools there is a system by which a portion of their earnings is kept by the school.

Q. Deferred pay?—A. That is practically what it amounts to. In the artisan classes at Sibpur, where that system is in force, some of the lads leave with as much as Rs. 200 after four or five years.

Q. Do the schools make things for customers?—A. Yes, nearly all the schools do. They have a kind of sales department.

Q. Is any portion of the sales proceeds credited to the workers?—A. Yes, the idea is that they should be credited with a share of the value of their labour.

Q. What proportion of these pupils are in receipt of scholarships or some form of financial assistance?—A. Probably more than one-half of them on the average; in some cases two-thirds.

Q. Apart from carpenters and blacksmiths, you also have weaving schools, especially the well-known institution at Serampore. What is the connection between the "missionary" effort at Serampore in respect to the introduction of the hand-loom, and the Department of Co-operative Societies in Bengal?—A. Some attempts are being made at co-operation between the two, but not with very much success. The Registrar of Co-operative Societies has in some cases asked for Mr. Hoogewerf's help and *vice versa*, and some of Mr. Hoogewerf's passed pupils have wanted to be helped and he has invited the assistance of the Registrar, but the results have not been very promising.

Q. You train in Serampore mostly educated men of the student type?—A. Roughly about half and half, rather more of the mistry type. In connection with your question about co-operative societies, we have recently had sanction from Government for a system of advances to help passed pupils to purchase improved looms, etc.

Q. As you know, there is a large area round Serampore where the use of the fly-shuttle loom is well known. Is it chiefly those men that come, or weavers from outside?—A. Many come from Serampore and many from other districts, independently of whether they have learned the fly-shuttle loom or not, in order to learn the weaving of various patterns.

Q. Is there any out-door demonstration staff attached to the Serampore weaving school, employed in the rest of Bengal in tracts in which they are attempting to introduce the use of

these looms?—A. No, there are no peripatetic members of the staff, apart from the outlying schools. There are about half a dozen outlying schools in different centres, which have a certain amount of local effect. There are travelling weaving demonstrators under the Director of Agriculture.

Q. Do you know what the Co-operative Credit Department is doing in the way of industrial societies, especially with reference to weavers?—A. Apparently it is not able adequately to meet the requirements of weavers. In consequence of that, Government appointed a small Committee, including the Registrar of Co-operative Societies, to consider the matter. The outcome was that we decided that a system of advances was best.

Q. Referring to this question of the Calcutta night school, I understand the pupils are mostly from local engineering firms and railways?—A. Yes, practically, entirely.

Q. Are any of those boys Indians?—A. Yes, a fair proportion, about one-quarter.

Q. Where do the Indians come from; are they not exclusively from railways and not from engineering firms? A. No, Burn & Co. employ a number of Indian apprentices, but at Lillooah there are a number also. The numbers are, for Burn & Co., 8 Indians attending the school out of 22 of their apprentices attending.

Q. Will you state for the information of the Commission what exactly is this Calcutta Government Commercial Institute?—A. It started with the commercial department attached to the Presidency College; then it was separated and at present occupies a rented flat near the centre of the town. It recruits from about the matriculation grade, and trains students for about two years in commercial English, arithmetic, commercial geography, book-keeping, shorthand and typewriting. There are also separate evening classes in various commercial subjects.

Q. What happens to the pupils?—A. They all get fair employment.

Q. Everybody gets employment in Bengal who has had a literary education, but are they more valuable in commercial offices than the man who has not had that training?—A. Their value is enhanced by the training they have got there.

Q. You say you consider the existing facilities at the Commercial Institute are inadequate; and you would like to have something better. In what direction would you like to have it improved?—A. Certain of the staff cannot be described as particularly strong, and none are highly paid; the Institute is only in temporary quarters, and not enough money is spent on it. A highly qualified English Principal has been asked for, but cannot be obtained at present.

Q. What are the numbers, roughly speaking, of the students?—A. About 50 in the day classes and 100 in the evening classes. Only about 6 to 10 yearly pass the final examination of the full day course.

Hon'ble Pandit M. M. Malaviya.—Q. You say that the workshop is the best place for training apprentices, but for giving people a little higher education, you certainly require a school of mechanical engineering rather than a workshop. Don't you?—A. You mean in training a man of the class of foreman? Yes, certainly, but workshop training also is necessary. There is a course in mechanical and electrical engineering at Silpur for the higher grade.

Q. Even for the mistry class, you cannot rely upon the workshops to give you a sufficient supply of trained artisans, can you? Therefore you will have to go to the industrial school to which the workshop would be attached, to give them the necessary training?—A. In the case of mistries I should limit the additional training very much.

Q. But would you not like to have a school where they could go through a regular course to prepare them for the practice of their craft?—A. As regards the mere mistry, if there were a sufficient supply the matter would be all right, but the supply is short, and for that reason I suggested a comparatively short course of training.

Q. You say that "firms are unwilling to train raw hands," so until you have a number of schools where young men could go to learn a trade, to receive the necessary education, you could not meet the demand?—A. Yes.

Q. What was the kind of work which the technical institute which Dr. Denning supported was intended to do? What was the standard you aimed at? Was it to produce men who could take up the duties of managers of concerns on the technical side?—A. It was for both. We had both in mind. There were various proposals; some were for a higher standard, and some for an intermediate standard.

Q. Both foremen and managers?—A. Yes; e.g., in the case of the printing department, we wanted to train both pressmen and men of the engineer type.

Q. From your remarks about the report not having been acted upon, it seems to me that you think that the report should have been acted upon before the appointment of a Director of Industries?—A. I have not expressed any opinion on that point. I was only stating the fact.

Q. How many of these technical and industrial schools are there in the province?—A. Roughly 50 of one kind and another, almost entirely industrial, and only about half a dozen technical schools.

Q. What are these technical schools teaching?—A. The technical schools are mainly teaching for the examinations of the Joint Technical Board for Civil Sub-Overseers.

Q. All the technical schools?—A. Yes. It is a two-year course.

Q. After these boys have passed your examinations, they join Sibpur in the sub-overseer's standard?—A. Some of them go on, others leave.

Q. What is the salary these sub-overseers get?—A. About Rs. 30.

Q. In the industrial schools what are the subjects you take up; is it the same course in all these schools, or do you deal with different subjects in different schools?—A. Various subjects. The two subjects commonly taken are carpentry and smithy. There is a small number of weaving schools, etc.

Q. What is the staff of these industrial schools?—A. They vary very much. The Bogra Industrial School has a staff consisting of a superintendent, assistant superintendent, a teacher-clerk, and 4 mistries—2 for carpentry, 1 for blacksmithy and 1 for tinsmithy.

Q. What is the number of students roughly?—A. About 60.

Q. Is the superintendent an European?—A. No, he is a passed student of Sibpur. Unfortunately when these men were appointed, which was before my time, there was no supply of very suitable men to be had, as the students of Sibpur were trained mainly from the point of view of civil engineering work. Now Sibpur is turning out mechanical and electrical overseers.

Q. Are those trained on the mechanical side suitable as teachers in these industrial schools?—A. Probably the most suitable class of men that you can get at present. I should say, however, that they ought not to go straight to these schools before having some practical work in the shops.

Q. You think that the theoretical education at Sibpur should be supplemented by more practical work?—A. It is professedly incomplete. Of course it does not profess to turn out mechanical engineers without further experience.

Q. Except for this Calcutta Government Commercial Institute, is there any other provision for commercial education in Calcutta?—A. There is some for girls, at the Young Women's Christian Association. There have been one or two ladies attending the Government Commercial Institute, but there are none there now. I am not sure about the Young Men's Christian Association. I think they probably have some commercial classes. In addition to that, there are a few private schools of typewriting and shorthand. Two large Anglo-Indian schools for boys and one school for girls have recently sought and obtained affiliation to the Government Commercial Institute, so that they may send in for its examinations their pupils who are taking commercial subjects at schools.

Q. About these industrial schools, the research institute and industrial school being placed under the Director of Public Instruction, don't you think that so far as the technological institutes will do research work, they should be placed under the Department of Public Instruction? The University also will be expected to do some research work?—A. Yes.

Q. The University will do some research work, and the technological institutes will do some research work; don't you think that they would be more properly under the Director of Public Instruction and that the business side might be placed under the Director of Industries?—The difference is this. At the technological institute the object of the research will be purely utilitarian, whereas in the other case the point of view is that of pure science.

Q. So far as the technological research institute is concerned, when it has arrived at results, these results might be communicated to the Director of Industries, but so far as the theory of the investigation is concerned, should not all the staff be under the Director of Public Instruction?—A. It is a very debatable point. I have instanced one or two cases; for example mining education is successfully worked under the Education Department at present and I don't think that any objection has been raised by the mining authorities to the way it has been worked. They are given an effective voice in control.

Hon'ble Sir F. H. Stewart. Q. You are an officer of the Indian Education Department?—

A. Yes.

Q. Are you also a qualified engineer?—A. Yes. I was for two years employed in electrical works at home.

Q. What was your professorship in Sibpur?—A. Mechanical and electrical engineering.

Q. How long did you hold that?—A. About eight years.

Q. With regard to the projected appointment of Director of Industries in Bengal, do I gather from your answer that he is to be under the Revenue Department, that he would not have any executive powers at all, and would be simply advisory?—A. I know very little about the proposal. It has not come through me.

Q. The Registrar of Co-operative Societies comes under the Revenue Department?—A. I believe so.

Q. Do you think from your knowledge of Bengal and Calcutta that it will be a good thing to associate an Advisory Board with the Director of Industries when he is appointed?—

A. I should say yes, as long as the Advisory Board does not hamper him in the matter of initiative.

Q. Do you think you would get suitable business men to serve on it?—A. I think so.

Sir D. J. Tata. Q. With reference to what you say about hydro-electric power surveys, if such power were generated, what openings are there for the application of such power? To what purposes could it be applied?—A. I have not thought that out definitely.

Q. If you had, say, hydro-electric power in Sikkim and Bhutan, to what purpose would you apply it?—A. Of course there are some industries that can be put almost anywhere, and some that cannot.

Q. What is the good of power where it is not wanted. Power must be where there are industries?—A. In Sikkim a concession for mineral rights has been applied for.

Q. Could not hydro-electric power be placed, say, in the hills, for the establishment of small industries, like cottage industries, in some way?—A. I am afraid the expense of distribution would usually be too heavy, unless they were grouped.

Q. I understand that in places like Norway and Sweden they have got small streams which are harnessed and small industries operated by such power?—A. In such cases it would usually be better to have your own water motor. Near Almora and elsewhere in the Himalayas small water motors are used for grinding corn.

Q. Is there any opening for hydro-electric power?—A. The subject has not been fully gone into. The first thing is to see if the power exists; another is that, if there is a good source, it might be put on such a scale that the power could be sent for 100 miles or so, if necessary.

Q. Are there any industries so situated which would benefit by this power among the hills?—A. There are some industries that can be isolated. In Norway and Sweden they have started big industries. Some can be located where the power is and others cannot.

Q. You don't see any way of applying it fully to any industry?—A. I have not gone into the matter.

Dr. E. Hopkinson.—Q. Is that Calcutta night school the only means of instruction for apprentices?—A. Yes, in Calcutta.

Q. There are only 60 apprentices who are receiving any sort of instruction?—A. Yes.

Q. If a technological institute were established in Calcutta, is it intended that it should have evening classes?—A. Yes, they would be a prominent feature of it. It is a thing badly wanted, to do something for mechanical apprentices. They do not get as good a training as they ought to.

Q. Would the technical institute have any relation to the University of Calcutta?—A. We just touched on the point. We wanted to be separate.

Q. What would be the relation of such an institute to Sibpur?—A. The idea was to remove the Sibpur College from its present site and practically divide it into three parts, the higher engineering classes training for the Bachelor of Engineering degree being transferred to a new and purely residential college at Dacca. The main part of the rest of the classes would be sent to the technological institute. Those training in the mining class to the mining institute in the coal fields.

Q. And the industrial classes, what would become of them?—A. Our idea was to take a number of boys into the workshop, as is done at Sibpur. There they have about 40 boys in the workshop training to be mistries; at Dacca there are about 70 such boys in the workshops.

Q. Was the scheme in regard to the institute in any way connected with the appointment of the Director of Industries: were the two things put forward together?—A. No, the genesis of it was the suggestion of my predecessor Dr. Denning. He was working single-handed and he considered that it was necessary on general grounds to start a technological institute, with the incidental advantage that it would afford him the occasional assistance of expert engineers, chemists, etc., to help him in connection with industrial investigations and inspections. It had been suggested before, but the suggestion had not been acted upon.

Q. What would you suggest should be the relation of the Director of Industries and the school of technology?—A. That is a very difficult question. I ought hardly to have attempted to give an answer to Sir Thomas offhand. The matter needs very careful consideration, and I would like to think over it for a couple of weeks before giving an answer.*

Mr. A. Chatterton.—Q. You propose that industrial education should be under the Director of Public Instruction?—A. Yes.

Q. What is the amount of your budget?—A. For my own work I could not say; I would have to add up different items. You would include Dacca and Sibpur?

Q. For purely industrial education?—A. It is rather mixed; it is not separated in that way in our budget; it comes under a number of separate heads, and I could not say offhand.

Q. You say you have about 50 industrial schools. How many pupils, roughly, would there be in the 50 schools?—A. It is very hard to give an average. The number varies from 60, as regards industrial pupils, to 20; that would make it roughly 2,000.

Q. Have you any approximate idea as to the cost of training these boys under this system; how much per month does it cost to train these boys in these industrial schools?—A. I would have to work out these data. I could do it with the aid of this list, otherwise I shall be guessing in the dark.

Q. I would like to know what would be the cost of training boys in these industrial schools, as they exist at present, and of the boys who enter the school, the percentage who go

* See also additional written evidence printed after oral evidence

through the full course of instruction?—A. I have fairly exact data in the case of a number of schools for that, but not for the whole lot of schools. I will, however, give the data* available.

Q. Do you inspect all these schools, or have you an inspector of industrial schools under you?—A. No, there are no inspectors under me.

Q. Do you inspect them every year?—A. No, I don't inspect all of them, only the chief ones.

Q. Are all these schools recognised by Government and do they get grants-in-aid?—A. No, about half of them. The number aided by Government would be about two dozens.

Q. Is there any industrial school on the Howrah side of the river for the training of apprentices in workshops?—A. No; Burn & Co., and Jessop & Co., send their boys over to the Calcutta night school. Most of the apprentices live in Calcutta. There is an evening school at Lillooh, 3 miles up on that side, for the Railway apprentices there.

Q. You say "in the mechanical engineering industry, the workshop is the best place for training the operative." Do these large workshops take apprentices; is there any scheme for drafting pupils who have been through an industrial school into such workshops as those of Burn & Co., etc?—A. I bring to the notice of the school authorities the possibilities that there are in these works. The authorities of the Kanchrapara workshops said they would not reduce the period of apprenticeship in the case of boys from industrial schools.

Q. What is the period of apprenticeship?—Six years at Kanchrapara. In most workshops it is five years. Those boys that desire a mechanical training are advised to go direct into workshops.

Q. Do Government give any scholarships to these boys while under instruction in the workshops?—A. No. They are fairly well paid; they get an allowance from the authorities of the workshop.

President.—Q. Does any apprentice pay a premium as well?—A. Not in most workshops, but Burn & Co. take some premium apprentices as well as non-premium.

Q. They are paid from the day they enter?—A. Yes, in nearly all workshops.

Hon'ble Sir R. N. Mookerjee.—Q. They don't get anything in the first year?—A. In most cases they do. In 5 workshops there is no allowance for the first year, in 11 an allowance is given; in all, there is an allowance from the second year onwards.

Mr. A. Chatterton.—Q. You are in favour of the establishment in Calcutta of a permanent exhibition of machinery and processes, in which power, supervision and labour would be provided for the working of the machines and processes at certain times for purposes of demonstration? I presume you have in your mind something similar to the Gewerbe Museums in Germany?—A. Something like the one in Cologne.

Q. Have you formed any estimate of the cost of running such a museum out here?—A. We meant to start it in a small way.

Q. Do you realise the difficulties that such museums would entail in regard to up-keep, on account of deterioration through the climate?—A. I would propose to run it on a very much less elaborate scale than is done at home. I have not found excessively rapid deterioration in plant and machinery.

Q. One section of such a museum would be the weaving section?—A. I suppose that would be one section.

Q. If you had warps fitted to looms would you not find considerable difficulty in keeping them in order?—A. Yes, but I presume that as demonstration is possible at Serampore it would be possible in Calcutta.

Q. At Serampore the work is going on continuously?—A. Yes, practically except for a couple of months or so.

Q. Whereas the demonstration work in the museum would be done two or three times a year?—A. Yes.

Q. What other class of demonstration work would you have in such a museum?—A. Anything that is wanted in connection with the improvement of local industries.

Q. Will you have engineering workshops?—A. Yes, that would be one thing, e.g., to show the use of improved tools, and special wood-working tools.

Q. In the industrial schools you say that from one-half to two-thirds are boys with scholarships; what is the range of these scholarships?—A. About Rs. 5 to 10 or Rs. 12.

Q. Who provides the funds for these scholarships?—A. In Government schools Government generally provide them; in some cases the District Boards.

Q. Speaking generally, do you consider that these industrial schools, in respect to the expenditure incurred in their maintenance, are serving any useful purpose?—A. I regard most of them as of comparatively little use.

Q. From these industrial schools have many of the boys found employment in the various Swadeshi factories that have been erected during the last few years?—A. I cannot say offhand.

Q. Has the preliminary education in these industrial schools been found of such advantage that it was any inducement to take the boys into these factories?—A. I cannot say.

Q. Do these industrial schools keep any list of what becomes of passed students?—A. In the case of several schools I have had a list prepared. It is extremely difficult to prepare a full and accurate list, as the boys often cannot be traced after they leave.

Q. Do you think the attendance in these schools is largely due to the fact of the scholarships?—A. Yes, many of the pupils would not attend unless they had some attraction.

Q. What percentage of boys in these industrial schools are sons of artisans pursuing the same trade; what percentage are boys drawn into the school by scholarships, and more or less dropping things directly the scholarship ceases?—A. It is very hard to say. A considerable portion are the sons of mistries in some cases where I have made enquiries.

Hon'ble Pandit M. M. Malaviya.—Q. If you were to improve the course which you teach in these industrial schools would they not become much more useful?—A. Yes, they are open to improvement. One question is that of suitable teachers, and whether it is worth while spending more money on them.

Q. Supposing you had adequate funds and employed the right kind of staff?—A. They could be greatly improved.

Q. Do you also think that, in addition to the sons of mistries, the sons of bhadralogs would be willing to go in for such training?—A. A number have joined the artisan department at the Dacca School of Engineering. There they have better supervision, an European foreman is in charge, and some very useful work is being done. In answering your other question I was speaking of ordinary industrial schools.

President.—Q. Would it not be advisable to keep a register of each school, showing the origin of the boy and as nearly as possible his subsequent history?—A. We have done that as far as possible, and have fair data in the case of several of the schools. At Dacca I know there are a number of bhadralogs as well as sons of mistries. At Sibpur there were a few of the bhadralog class.

Hon'ble Pandit M. M. Malaviya.—Q. We found the son of the late Dewan of a State working in the carpentry school at Bareilly.—Do you find that the bhadralog class are similarly willing not to take advantage of such a training?—A. Yes, there are signs of their beginning to take it up.

Mr. C. E. Low.—Q. Do you remember any instance of what happened to these bhadralogs in the artisan class in the Dacca School?—A. It has only recently been worked up. The numbers have doubled in the last few years.

Q. They have not begun to pass out?—A. The bhadralogs have not.

Q. You are aware that the Bengal Government submitted to the Government of India not very long ago a proposal for the appointment of a Director of Industries?—A. Yes, they sent up a proposal.

Q. Have the Bengal Government, or you, thought out what industries the Director of Industries Department was going to take up?—A. The case has not gone through me, but I believe that particulars have not been gone into.

Q. Have you yourself any idea as to the industries that should be taken up, because the scope and size of the department and the class of man would naturally depend on the kind of work he was to do?—A. Very much. I have considered what we might do in Calcutta. I have not gone into the question of village industries.

ADDITIONAL WRITTEN EVIDENCE (submitted after oral examination).

I submit two statements giving particulars on questions put to me at my oral examination, viz., (a) on the cost per pupil in industrial schools in Bengal, and (b) on the proportion of passed pupils suitably employed.

Another question was put to me by the President, which I preferred not to answer without consideration, viz., whether I thought that the proposed Calcutta technological institute should be under the Department of Industries or under the Education Department—supposing the former were established as a separate department under the Financial Department. The constitution of the proposed Department of Industries is entirely indefinite at present, but I assume that it will be somewhat on the lines of the Departments of Industries in Madras and the United Provinces. On that assumption, I consider that the Department of Industries would be an unsuitable organisation for managing the proposed institute, and that the present Directors of Industries of the United Provinces and Madras, however well qualified for their present duties, are neither of them qualified to control such an institute.

As I said in my written statement, mining education in Bengal and Bihar and Orissa is successfully managed by the Education Department under the advice of a Mining Board. The Committee on Mining Education proposed (in their Report 1914) to continue this arrangement; and Messrs. G. F. Adams, Glen George and Robertson, in their recent report (1916), written after a visit to England, repeat the proposal that the projected school of mines should be under the Education Department—although the suggested appointment of a

Director of Industries must have been known to at least two of these gentlemen when they wrote their report. Seeing that the success of this system is established it seems most inadvisable to make experiments with an untried organisation to which there are obvious drawbacks.

Some four years ago Government decided that a surveying school should be started at Mainamati and managed by the Survey Department. The Director of Surveys informed me, even before the school was opened, that he wished it were in the hands of the Education Department, and that if he had known what was involved he would not have proposed that the Survey Department should undertake it. He subsequently recorded the view that he had no objection to the Education Department's taking over the school. This case has some bearing on the question at issue.

The institute proposed in the 1913 report would be mainly and primarily an educational institution and should, therefore, be under the Education Department. If unlimited funds were available there might be an educational institute under the Education Department and also a separate research institute, under the Industries Department, consisting of a set of laboratories in which industrial questions could be investigated and a few students trained in this work by apprenticeship as assistants in the laboratories. But this would be extravagant besides having other drawbacks.

Industrial schools in Bengal.

The list in my office of technical, industrial, and special schools comprises 47 in all, of which 7 are Government schools, 28 are aided by Government grants, and 12 are unaided. It does not include some small typewriting schools, etc. From the list I have selected 28 schools which may be classed as industrial: I have omitted art schools, schools for deaf, dumb and blind, and certain orphanages which are rather charitable than industrial. Of these 28 schools, 17 are worked by missions, 5 by Government, 2 by District Boards and 4 otherwise. The total annual cost of the 28 schools is Rs. 76,000 for about 1,000 pupils, or an average cost of about Rs. 6½ per pupil monthly. Of this amount Rs. 40,000 annually, or an average of about Rs. 3½ per pupil monthly is contributed by Government.

Employment of pupils from certain industrial schools (including those pupils who leave prematurely).

School.	Authority.	Number of pupils who have passed out in the period considered.	Minimum percentage suitably employed.
Pabna	District Board	146	48 per cent.
Barisal	Government	42	77 "
Kalimpong (carpentry)	Mission	37	41 "
Mymensingh	District Board	24	71 "
	TOTAL	249	59 per cent. (minimum).

The balance of pupils includes those who have died, those who cannot be traced, and those who are employed on work unconnected with their workshop training. The actual percentage suitably employed is, therefore, greater than the figure given. I always urge the importance of keeping such records, but the difficulties are obvious and many pupils cannot be traced.

WITNESS No. 113.

MR. SATYA KANKAR SAHANA, representing the Kodarma Mica Mining Association, Mr. S. K. Sahana, Hazaribagh.

WRITTEN EVIDENCE.

With the gaining ground of electricity as one of the best motive powers, mica, which is mostly used in electrical appliances, is growing into importance as an important and valuable article of commerce. Mica mining is an infant industry, not older than four or five decades, and it requires a careful eye for its proper development. Chotanagpur, Bihar, Orissa, Nellore (Madras), Sawar (Rajputana), Nepal and other places of India are rich in mica. But at present most of the valuable mica mines that are being worked lie in the districts of Gaya, Monghyr and Hazaribagh, especially Hazaribagh which heads the list.

Kodarma, a small village in the district of Hazaribagh, is the principal village of a Government Khasmahal of the same name. About 45 square miles of this Kodarma Government Khasmahal is a reserved forest with a fringe of protected forest around it. This reserved forest is very rich in mica and the Government granting leases under favourable terms and conditions, most of the principal mica mining firms have got their mines in this forest. Considering all this Kodarma may be termed the "centre of mica mining industry" in India of the present day. My field of action is limited to Kodarma and the adjoining places and my experience is solely gained in that field; so I venture to request the Commission to consider my statements with an eye to the limited nature of my experience.

Though mica is such a valuable article of commerce and the infant industry of mica mining requires careful looking after for its proper development, yet for various reasons, it is not growing as it should have done. I try to enumerate some of the difficulties in its way and to explain how they prove drawbacks on the mining industry.

Forest Department.

1. (a) *The existence of the reserved forest.*—The theft of mica and the destruction of pillars and the consequent lessening of the longevity of mines are the crying evils of the mining industry. The presence of the forest, dense in bushy and grassy growth, gives shelter to wild animals and thieves and robbers and makes the mines less accessible to mine owners and their men than they would have been if the mines were on open land as are the coal mines generally.

The income of the Kodarma reserved forest from the mining lessees is more than six times its income from forest produce. The forest is full of trees which seldom yield any valuable timber. The soil is so unfavourable to the growth of sal trees, which are the only valuable trees in this forest, that most of these trees are top-dried and there are few trees in the jungle the girth of which is above 10 inches in diameter. Considering all this the depletion of the forest should be suggested to the Government.

In case the depletion of the whole forest be considered undesirable for other reasons, setting up of villages within the forest may be suggested. Before the forest became Government property and kept as reserved there were many villages within its ambit. If such villages be set up now, they will be to the advantage both of the forest department and the mica mining industry; the labour problem that has been growing more difficult every day will be partially solved by the setting up of such villages.

(b) *Want of roads in the forest.*—In the beginning of the industry pits were made only in those places where the surface indications were very hopeful and so only surface mines yielded sufficient mica at little cost. But now that such surface veins have mostly been worked out deep mining is necessary for getting mica. In deep mines heavy machinery is necessary for the purpose of keeping water out of the mines. But for want of roads the mine owners feel immense difficulty in carrying the heavy machinery to the pit-heads; so much so, that sometimes the carriage cost is more than the actual cost of the machinery itself. Government should open up the forest with a few main roads and feeder roads to them. The mine owners pay a good amount in road cess; every pice of that amount should be spent in making roads; the Government should further pay a little from the income of the property for its development.

(c) *The way in which timber for the mines is supplied to the mine owners at present.*—Timber is necessary for the mines and the mine owners get necessary timber from the reserved forest. If the forest be not depleted it is reasonable that the necessary timber be supplied to the mine owners as conveniently as possible. Formerly the mine owners used to get the timber from the vicinity of their mines; but for the last few years the coupe system has been introduced. From the diminution in consumption of timber from the coupes and the bringing in of timber from other places by the mine owners it is evident that the coupe system has proved a failure. The introduction of the old system of timber supplying may be suggested to the Government.

(d) *The compensation realized from mine owners for trees felled in prospecting or mining work.*—Whenever a prospecting licensee or mining lessee in prosecuting his operations is compelled to clear a part of the surface land of trees the forest department following the "Rules regarding Prospecting Licenses and Mining Leases for Mica" and "the Forest Manual" often demand and sometimes realize heavy compensations from him. For facility of prospecting and mining work the compensation system should be abolished or made nominal.

2. *The way in which leases are granted, specially by private Zamindars, to irresponsible persons.*—Thinking mica mining to be a very profitable industry which can be carried on at a very small cost, persons who have very little capital, somehow secure prospecting licenses and mining leases in private zamindaries and sometimes even in Government land. These men make holes up to twenty or twenty-five feet deep, and then, finding the mine not up to their hopes give it up, destroying the pillars when leaving it. Perhaps that mine pushed a few feet ahead, would have turned into a good mine. But the destruction of the pillars ruins the future prospect of the mine by making it too costly or impracticable for a second man to develop it. Some law preventing such destructive work should be suggested to the Government.

Marketing.

3. *Want of mica market in India.*—Though most of the mica produced in the world is from the mines in India, it is wholly consumed in the countries of Europe and America. The mine owners, especially the Indian section of them, from their ignorance of the proper value and

use of mica, sell their mica to middlemen shippers at a small margin. These middlemen often make the enormous profit of two to three hundred per cent. The mine owners from the nature of their profit do not consider the mines to be valuable properties and consequently neglect their development. Some way should be found out by the Government for helping the mine owners in getting their due share of the profits and so giving them an incentive to develop the mines.

4. Want of knowledge of the proper use of mica and the consequent want of a manufacturing industry is a great drawback to the industry. India, as in various other departments of trade, supplies the raw material only in mica. Micanite, chimneys and other articles are all prepared out of India. The people here do not know in what way mica is used; there is a mystery enveloping the mica business. The institution of pioneer or demonstration factories may be suggested to the Government.

5. *Spread of a knowledge of proper mining and manufacturing.*—The institution of pioneer and demonstration factories will not suffice to remove the ignorance prevailing. The appointment of an expert to give advice to the managers and officers in charge of mines and factories on mining and manufacturing of mica and generally about the way it is used should be suggested to Government.

6. As is natural a limited and defined area is leased out by a lease. But in the case of Land policy, mines situate in villages it often happens that the lessee, following the vein, finds himself encroaching on the adjoining ground which is the occupancy holding of a tenant. According to the prevailing law the lessee must acquire the right of the tenant by giving him full compensation or stop the mining operation. But the tenants in such cases often demand such exorbitant compensation that the lessee is compelled to stop work. If the lessees, in such cases, had the land acquired for him under the Land Acquisition Act by the Collector of the District, many disputes and disturbances would be avoided. The introduction of such a law may be suggested.

ORAL EVIDENCE, 6TH DECEMBER 1915.

President.—Q. I understand that you are representing the Kodarma Mica Mining Association. We have asked other members of your Association to consider what practical means can be adopted for restraining the practice of mica thieving. It has been suggested that it is practicable to stop all transport of mica at night, and also for all the mica in the Kodarma area to be assembled at certain depôts which should be recognised as the only depôts through which the mica should pass out of the district. Will your Association consider these proposals?—A. The proposals will go a little way in stopping the thieving of mica. Because the thieving of mica is generally done at night by the coolies when the mines are not worked by the mine owners.

Q. If it were made penal to carry mica at night do you think there would be a stoppage of this practice?—A. It is rather difficult, because the mines are far away and the forests are all infested with wild animals and they are inaccessible even in the day time.

Q. Perhaps the law could provide for certain people to take passes for carrying mica at night. Your note is so full and clear that we shall consider the statements contained in your written evidence. Will you discuss these proposals with your Association?—A. I shall.

WITNESS No. 114.

MR. E. HOOGEWERF, A.M.S.T., *Principal, Government Weaving Institute, Serampore, Bengal.* Mr. E. Hoogewerf.

WRITTEN EVIDENCE.

The industrial development of India, is a problem, which does not offer a very easy solution, the economic and industrial conditions being different in almost each of her provinces. In these circumstances an effective and general remedy falls short of the mark. The question has many aspects, and the solution of the difficulties necessarily requires individual diagnosis.

India once held a commanding industrial position in the world, which she has now lost, by her apathy and conservatism in not keeping pace with her more formidable industrial and commercial competitors.

The Indian artisan, in most of his handicrafts and methods of work, is more than a century behind time, and even at this stage, he is reluctant to adopt the improved methods of work and machinery, which gave his rivals the start, and caused a decay of Indian industries.

The salvation of the Indian artisans, does not lie in their obtaining foreign markets, but in regaining the home markets they have lost, in which the advantages are in their favour.

The main impediments to the advancement of industries and trade are a lack of money and market. As regards the first, sufficient capital is obtainable in India, although the native capitalist is prone to lock up money in landed property, or in Government banks, rather than to invest his capital in less certain exploitations. The general movement in

India at present, of promoting co-operative work and of instituting central and rural banks has in some Provinces tended to give an impetus to agriculture and cottage industries, thus supplying a much needed want. This movement is spreading rapidly, and the people of the country, both artisans and capitalists, are now taking to it more kindly.

The other difficulty, *vis.*, that of the artisans obtaining a market for their goods, is a problem which cannot easily be solved for reasons already stated. It will be necessary for the artisan to rouse himself to greater efforts in industrial improvements by removing the obstacles which have led to the decline of Indian handicrafts.

The needs of the present war, which has caused a demand for the supply of local-made goods and products, to some extent, have brought the consumer more in touch with the local manufacturer for his requirements, which indicates that India still possesses great manufacturing possibilities, if funds are forthcoming and markets are obtainable.

For the introduction of improved machinery, I would recommend the employment of peripatetic instructors whose duty it would be to demonstrate practically improved methods of work and machinery in the villages, and further to instruct the cottagers, by means of lectures, and also to bring them in touch with merchants for the sale of their goods and the purchase of their raw material. I advocate this system of instruction for the artisan classes rather than through the medium of technical and industrial district schools, as a fair proportion of the artisan classes who depend partly on cultivation and partly on industrial work are averse to leaving their homes.

Technical and industrial schools have their limitations, and for them to be a success it will be necessary for improved machinery and methods of work to be introduced previously in the villages, thus creating a demand for higher instruction.

Having commented generally on the subject of the development of Indian industries, I give below the replies to the list of printed questions supplied.

Q. 1.—I have not been directly concerned in the raising of capital for industrial enterprises, but I have on more than one occasion had to assist in bringing capitalists together, to form private companies in order to start small factories such as rice factories, cotton, ginning and pressing factories, etc. The proprietors of these factories were generally persons who had an intimate commercial knowledge of these particular industries, and were already engaged in trading in the raw material. The task of bringing these capitalists together was not difficult, as it required merely a little tact in introducing the parties concerned, and later of assisting them in the selection of suitable machinery to treat the raw material. As regards the business side of the question the capitalists required no information as they were already acquainted with the market conditions and were in a position to calculate profits. I have also had some experience, since coming to Bengal, of starting small hand loom weaving factories pioneered by youngmen who saw possibilities of success. These youngmen in most cases opened business on a very modest scale owing to limited funds which were just sufficient in most cases to purchase the plant and to defray the working costs of the factories for a couple of months, hoping that in a short time assistance would be forthcoming from capitalists, who had promised to financially assist them and to market their goods. In several cases I believe that the working capital promised failed to be supplied, with the result that most of the young adventurers, who were enterprising enough to open such factories, had to close business after working for a year or more. In other cases, owing to the interference of the young men's relatives, the factories did not work more than two or three months. Hand loom weaving factories, properly financed and opened under favourable conditions, with an adequate plant of machinery, have succeeded fairly well in some parts of India and are acknowledged as profitable investments.

In south India the Basel Mission, after continued efforts of about twenty years, has established this fact, and there are at present several weaving factories working satisfactorily. In Japan, China and in some parts of Europe, hand loom weaving factories have been found by smaller capitalists to be quite a good investment for their money, and I feel certain that such factories would also give equally good results in India if they were properly financed and managed.

Qs. 2 & 3.—There are in India certain sects of people who depend entirely on trading and money lending. These sects possess very keen business instincts, and whenever opportunities offer of investing their capital lucratively, they are not averse to doing so, especially if assured of success by a reliable authority, who can be depended on to assist them in their enterprise. These classes of people do not, as a rule, possess sufficient educational qualifications and are hence dependant, for their shortcomings, on others who are better informed than themselves especially in technical matters. These trading classes attach great importance to seeing things for themselves, and wait patiently for others to give the lead and when convinced of the success of the experiment they readily follow suit.

Pioneer demonstration factories, if established according to the requirements of each Province, would be useful in promoting and developing industries. The ginning and pressing factories in the cotton growing districts, the rice mills, the coir and oil mills of South India are examples which may be cited in support of my statement. The number of these factories has increased so rapidly during the last fifteen years that they cannot now be maintained in full-time employment. Combines have in consequence been formed to protect these industries but in spite of the measures taken, a large number of factories are annually stopped for the want of raw material.

Q. 4.—As regards financial aid by Government to industrial enterprises, I do not think that much direct assistance has been rendered, although the efforts of Government so far seem to have been directed more towards instructing the industrial public through the medium of technical and industrial schools, on which much money has been already spent. These institutions are becoming more popular. Government assistance.

Q. 5.—The methods enumerated under the heading of giving Government aid to existing or new industries will depend on the local conditions of the various Provinces of India, and I am of opinion that no hard and fast rule can be laid down in this connection. The solution should be left entirely to competent authority employed in the promotion of the particular industries.

Q. 6.—Government control should exist in all cases where Government capital is concerned, in order to determine whether the money is being utilised satisfactorily for the object for which it was given.

Government control can best be exercised as follows, by adopting a system of inspection similar to that exercised in connection with the co-operative credit societies, viz.

- (a) by active inspection of factories, to which Government aid has been granted by officers specially appointed for the purpose;
- (b) by the checking and auditing of accounts.

Q. 7.—I regret I have had no experience of factories pioneered by Government.

Q. 8.—As regards the question of Government pioneering industries, this may be done by a system whereby the cottagers could be instructed at their homes in improved methods of work, and by the introduction of modern machinery suitable to their requirements, which could be supplied to them through the medium of co-operative societies or rural banks. The loans for the supply of raw material and machinery could be recovered from the artisans in easy instalments. Secondly, as regards organised industries, mercantile firms and importers of machinery should receive assistance from Government to establish pioneer factories which will enable Indian capitalists to determine whether such concerns are profitable or not. The present importance of the following industries is due entirely to European enterprise which proved to the Indian capitalists that such factories were lucrative investments for their money:— Pioneer factories.

- (a) Cotton ginning and pressing factories,
- (b) Rice mills,
- (c) Coir factories,
- (d) Oil seed pressing factories,
- (e) Saw mills,
- (f) Spinning and weaving mills,
- (g) Carpet factories.

I am averse to the policy of Government entirely financing industrial enterprises and mills, as there seems to be no necessity for such measures.

Q. 9.—Most of the cottage industries, such as weaving, sericulture, metal working, etc. are hampered by the present conditions under which they are financed by private traders who supply the raw material to the artisans and take back the manufactured articles after paying the manufacturer just a living wage. They also advance capital to the cottagers at high rates of interest, so as to have a firmer hold on them. The co-operative movement in India has to some extent encouraged industries by forming co-operative societies, financed through rural or central banks. The present rules and laws, however, of the co-operative societies call for revision and modification, to make them applicable to certain industries. These societies have been very helpful in affording assistance to the artisans in tiding them over difficult times, in enabling them to purchase their raw material at wholesale rates, and in marketing their products. The co-operative movement is still in its infancy and much remains to be done before its methods of work can be made efficient, and the people of the country realise their advantages and take to it more kindly. Financing agency.

Q. 10.—The institution of banks, central and rural, has been most useful in meeting in a small way the financial requirements of the artisans and others industrially employed, but hitherto the funds at the disposal of the banks have been limited, due probably to the fact that the capitalists have not much confidence in them. These banks could be considerably improved if placed on a safer footing by Government, and they would thus be able to render more substantial aid to larger enterprises. The paucity in number of these banks has also tended to retard progress in the number of co-operative societies.

Qs. 11 & 12.—The cottage weaving industry has, especially in some provinces, derived a fair amount of assistance by the establishment of co-operative societies. Co-operative societies should be established to assist most of the unorganised industries. Co-operative societies.

These societies are helpful to the artisans in partly removing the two impediments to the progress of the trade and they have rendered financial assistance to the artisans for purchasing raw material and marketing their goods. Many industrial co-operative societies were started, but several of them have not yet proved a success, which I think is due in a great measure to the want of active supervision and of an adequate staff of inspectors to instruct the artisans

in improved methods of work and in the introduction of improved machinery. For the co-operative movement to succeed it will be necessary to gain the confidence of the people, and this can be done by the employment of expert inspectors to assist them in removing their difficulties, and by obtaining the assistance of philanthropists to interest themselves in the advancement of co-operative work.

Limits of
Government
assistance.

Q. 13.—Government aid should be given merely to promote and strengthen existing and decaying industries, not with a view to competition but to stimulate and revive their conditions.

Q. 14.—Government aid should be extended to enterprises after a thorough investigation as to the possibilities of their regeneration and success. The support or aid should be continued until the conditions have been improved, and the industries are put on a sounder footing. The revival of decaying industries will in most cases take years to accomplish hence prolonged and strenuous efforts are needed. The departments or officers entrusted with the promotion of these industries should be given more latitude than at present.

Technical aid.

Qs. 15 & 16.—I have been entrusted with the carrying out of a scheme intended for the revival of the hand loom weaving industry of Bengal. This scheme was brought into force in the year 1909, and since then the efforts of the Education Department have mainly been devoted to imparting instruction to the weavers in modern methods of work, and in the introduction of improved looms and preparatory machinery. Judging of the merits of the scheme from an educational standpoint I may state that the various district schools, which have been established in conjunction with the central institution, Serampore, have met with success inasmuch as these schools have been well attended and the batches of students passed out annually from the institutions have acquired sufficient knowledge to enable them to enhance their earnings on their return to their villages. These industrial schools have met, in a small measure, the needs of the Bengal weavers, but I do not consider that the hand weaving industry of Bengal will be revived to any great extent, or will receive the impetus necessary, until the present scheme is combined with a more effective means of instructing the masses of the weavers of the country. As regards the financial side of the question, until co-operative societies have been established in every village Government aid will be necessary for the purchase of the machinery.

Q. 17.—The loan of Government experts should be made to private firms or companies, if they require their assistance. If the loan of a Government officer is likely to last longer than for a period of one month, the private firm should be called on to meet the whole or portion of his salary.

Q. 18.—The results of any research or original work done by Government experts while with private firms should be carefully collected and submitted for the information of the department to which they belong. The Director or head of the department should record the results of all such research work, and he should be permitted to publish, with the consent of the firm, such results as would be a benefit to the industrial public.

Demonstration
factories.

Qs. 19 & 20.—In Bengal the hand loom weaving industry stands next in importance to agriculture, and as such greater efforts should be made to promote this particular industry on the lines suggested above, and also by establishing on a modest scale two or three hand and power pioneer weaving factories in some of the more important weaving centres to prove to the capitalists that such enterprises are not merely exploitations, but are a good investment to them. These pioneer factories may later on be handed over to those who are likely to run them efficiently, and have business connections and sufficient working capital at their disposal.

Research abroad.

Q. 21.—Research abroad has had the effect of convincing and removing from the mind of the manufacturer any doubts he may have had as to the possibilities of success in the working and disposal of manufactured goods. Research abroad has also brought local manufacturers more closely in touch with manufacturers of other parts of the world whose industries were found in a more developed condition.

Q. 22.—The Imperial Research Institute should be given facilities of benefiting by the results of research work in the United Kingdom. This I think may conveniently be done by affiliating the two institutions.

I do not however consider any provision necessary at this stage for the research of special subjects in the United Kingdom, unless perhaps difficulties exist at present in connection with some of the organised industries, as the proposed Indian Research Institute or Institutes, if provided with an efficient and competent staff, should be able to cope with these difficulties.

Q. 23.—The Advisory Council for Research in the United Kingdom may possibly assist Indian industries, by its being more in touch with the Government industrial departments of India.

Q. 24.—I am averse to the idea of research problems being referred to educational institutions and colleges for solution, as such institutions cannot sufficiently cope with the work. Research Institutes should be separate units, specially equipped and staffed for this particular duty.

Surveys for industrial purposes.

Qs. 25, 26 & 27.—I consider that Research Institutes should be entrusted with the conduct of surveys for industrial purposes and, if found necessary, assistance in conducting these surveys should be afforded by local industrial departments.

The results of such surveys and recommendations should be referred to the local Government and a suitable experimental scheme for the improvement of the industry concerned, should be introduced.

Qs. 28 & 29.—Commercial museums are no doubt useful institutions, inasmuch as Commercial they afford facilities to commercial men in examining and knowing where raw material and finished products can be obtained, but for such institutions to be of real good to the country, each district, or at least each division, should have its own museum, in which the specimens of raw material and finished products should be carefully preserved for the use of those interested in commercial and industrial work. Lists should also be printed and kept up-to-date, specifying the quantity and quality of the products available, and the prices at which they can be obtained from local merchants. These museums need not be established on a grand scale, but should be sufficient to meet the requirements of local merchants.

Q. 30.—Commercial museums and sales agencies, if established in the principal towns of India for the display and the sale of the products of unorganised cottage industries, would meet a much needed want. These sales agencies, to be popular, ought to have sale representatives, not Government officers, but firms that would be willing to transact business on a commission basis.

These sales agencies would be most helpful to the artisans, as through their agency co-operative bodies could dispose of the goods of the artisans with greater facility. The artisans would not be obliged to spend their time in hawking their goods about and to depend on retail sale.

Sales agencies could effectively be connected with commercial museums, and the cost of both institutions could be partially met by a fee being charged on all goods placed for sale there. These sales agencies could also display samples of imported articles for which there is a demand in the country.

A number of local sales agencies or deshi shops already exist in the country, whose business it seems to be to market Indian manufactured goods. How far they have been successful I do not know, but judging from appearances they seem to command a fair trade.

Q. 31.—The institution of periodical industrial exhibitions would undoubtedly assist, if run on proper lines, but hitherto little or no advantage has been gained by the industrial public from these exhibitions, except perhaps that some exhibitors were able to dispose of a portion of their stock of goods.

Q. 32.—It still seems premature for these industrial exhibitions to be of any practical value to the people of the country, but if Government would adopt means whereby the zamindars and philanthropists of the country would join hands in making these exhibitions a success they would have a beneficial effect and should serve as a source of information to the industrial classes.

Q. 33.—The main object of these exhibitions should be to display the products of the country, finished and unfinished, and their methods of manufacture. The capitalists and other leading gentlemen should be asked to assist in the introduction in their villages of improved machinery and appliances which would be suitable to the cottagers. I attach great importance to this particular form of assistance from the leading people as much depends on them in assisting the experts and other Government officers in promoting industries by removing from the minds of the villagers any prejudices they might have.

Qs. 34 to 36.—The appointment of trade representatives in Europe and in the Colonies to represent Indian interests and to open up new markets abroad, as far as the raw material available in the country is concerned, would decidedly strengthen the present condition of the Indian export trade and at a later period with the development of industries the country would benefit by it; but at present India is not in a position industrially to face competition. The main object lies in regaining her home markets, as I have said before.

Provincial trade representatives would also assist in promoting local trade and in rendering facilities to manufacturers in disposing of their goods.

Hitherto these responsibilities rested with European and Indian commercial houses, and they have done much in securing for India markets for her exports.

These firms are wide awake to their interests, and, if given possibilities of further business, they would not be backward in availing themselves of the opportunities and support if offered by Government.

The only recommendations that I can make in this matter is to follow on the lines adopted by Japan, America and Germany, in obtaining markets for their industrial products and in taking advantage of conditions favourable to them for the purchase of raw material.

Q. 37.—The principal purchasing departments of Government could assist Indian industries considerably, by publishing lists of articles required by them, and by obtaining local manufactured articles from co-operative societies, local firms, etc., on lines indicated by me before. The publishing of lists of the articles, with the prices at which Government is willing to buy would not be advisable. What may be done is for the heads of the purchasing departments to invite quotations, or tenders, for their requirements. Particular care should be taken to see that the articles supplied by the merchants or co-operative bodies are exactly as per approved samples.

Training of labour.

Qs. 44 to 49.—The skill and efficiency of the labourer, can effectively be improved by introducing a system of village instruction whereby the cottagers could be taught modern methods of work and the use of improved machinery at their villages. Simultaneously, through the medium of the co-operative societies and banks, improved machinery could also be readily introduced. I have tried this system of work, on a very modest scale, in some of the villages, while on deputation in other provinces, and the results are encouraging. I have found that improved machinery can be readily introduced and instruction can be more easily imparted to the artisans by the employment of an efficient peripatetic instructor, or by temporary village schools. The villagers while under instruction, however, require subsistence allowances, without which few of them can afford to devote a portion of their working hours to study modern methods of work.

This system of instruction has been found most effective as regards hand loom weaving and it should answer the purpose equally well for industries of a similar nature, namely sericulture, silk reeling, spinning, gur making, dyeing, and a number of other minor handicrafts.

Referring to the industrial schools of Bengal I may state that they have annually turned out batches of successful students, but such schools cannot materially help in the regeneration of decaying industries as the numbers they pass out are inappreciable as compared with the masses of the country employed in industrial pursuits. If any radical improvement is to be made a system of village instruction must be introduced and the work of the instructors must be actively supervised.

The system of training apprentices in factories and workshops has, I believe, met with a fair measure of success, as for instance the apprentices trained at the various railway and engineering workshops, mills and factories have in the majority of cases turned out efficient workmen. These men however lack a theoretical knowledge of the subjects. Night schools, or classes similar to those introduced in Europe, would be useful and they would no doubt tend to turn out more competent workmen.

Q. 50.—Technical and industrial schools should, I think, be placed under the control of a separate Department of Industries, especially in provinces where the number of educational institutions are numerous, as the Educational Department can not spare time to devote to the development of industries which have hitherto been believed of minor importance. These departments are closely connected with each other in educational matters and may be considered as sister departments. They should be placed under the General Secretary to the Government, Education Department, but should have separate budget allotments for each department. The Director of Industries should be a Joint Registrar of Industrial Co-operative Societies, as I have found from experience that industries cannot be developed sufficiently under the present system.

Supervising and technical staff.

Qs. 51 to 53.—For the improvement of Indian supervisors and skilled workmen already employed in factories, engineering workshops, and mills, who would be willing further to improve their capabilities, Government assistance in sending them to foreign countries, to learn more up-to-date methods of work, would be useful. By Government assistance I mean that the authorities of the mills and engineering workshops should also assist, and they should guarantee employment and better prospects to such of their employés, on their return, who have been enterprising enough to improve themselves.

I hardly think that it will be necessary to afford facilities to technical experts of private firms, as such men have constant opportunities of returning to Europe where they as a rule acquaint themselves with all recent improvements and up-to-date methods of work. In certain cases mercantile firms, when they know that it is to their advantage, send their men to England to acquire the necessary information.

As regards officers in Government employ, the facilities for their studying trade conditions in foreign countries, and thus of keeping pace with the advancement of industries, are not sufficiently encouraging and permission to do so is not easy to obtain. Speaking from experience I consider that the deputation of officers to foreign countries to study the conditions and methods of work, where certain industries are more advanced, is most necessary, and greater opportunities should be given to Government experts of acquiring special information.

Mechanical engineers.

Q. 54.—I believe there is a difference of uniformity in the standard of examinations for mechanical engineers held in the various provinces. This difficulty may be removed by the written and practical questions being set to the candidates on lines similar to the examinations conducted by the London City and Guilds Institute. The arrangement is that the examinations are held on the same date throughout England and the Colonies, and the candidates are required to pass the same written and practical tests. These being the conditions, a uniformity of test would exist and any differences of opinion would be removed.

Q. 55.—It seems necessary that all those in charge of prime movers should possess Government certificates of competency. In the case of qualified men from England, if the examinations they have passed are of equivalent standard to those of the Indian examinations, there should be no objection raised to their being placed in charge of prime movers.

Official organization.

Q. 56 to 60.—The development of industries in this province rests with the Bengal Educational Department. A Superintendent of Industries assists and advises the Director in matters relating to technical and industrial education. This officer's time is mainly

employed in attending to official correspondence and in inspecting technical and industrial schools to maintain them to the required Government standard of efficiency.

The present organisation does not satisfy the needs of the province. For the effective development of industries a separate department should be created in the Education Department with a Director of Industries at its head. The Director should have at least three expert inspectors to assist him in the development of the industries of the province. This department should have separate budgetted funds. The Director of Industries should be a business man and should also possess a fair knowledge of at least one of the primary industries of the province.

I do not consider that a Board of Industries is necessary for the present.

Q. 62.—The most suitable form of machinery to correlate the separate activities of the various Provinces as regards industries may I think be suggested in the formation of an Imperial Research Institute, which will tend to avoid the repetition of research activities in provincial technical institutions and colleges.

Q. 64.—The formation of an Imperial department would be useful for the promotion of Imperial organised industries, *viz.*—chemistry (including agricultural, metallurgical, tinctorial, and pharmaceutical chemistry), the leather and hide industries, glass making, sugar and alcohol manufactures, paper making, and oil seed industries. depart-
ments.

Q. 65 to 66.—As to the nature of the administration, the heads of Imperial and Provincial Departments, should not be purely advisory, but should be vested with administrative and executive control.

The Provincial Industrial Departments of each province, should be assisted by managing committees consisting of official and non-official members. The Presidents of these committees should be the executive officers of the districts of the provinces.

Q. 67.—When the services of any imperial experts are placed at the disposal of a local Government he should abide by the rules of the department in which he is placed. As regards the salary, allowances, etc., of the officer whose services are loaned, these should be sanctioned in accordance with Government rules applicable to officers on deputation in other Provinces.

Q. 68.—Local Governments should have power to engage their own experts when necessity occurs for improving unorganised or cottage industries. Provincial depart-
ments.

Q. 71.—Technological research institutions may best be developed as Imperial institutions, and they should, if possible, be made to fit into a general development scheme for the whole of India. Technological insti-
tutions.

Q. 72.—As regards investigation and research, I am in favour of each research institution dealing with a limited group of related subjects.

Q. 73.—Government control of these research institutions seems necessary, and these institutions should be placed under the Imperial Government.

Q. 74.—It is very necessary that measures should be taken to co-ordinate and prevent the unnecessary over-lapping of research activities in Government technical and scientific departments. The work of such institutions can best be controlled and directed by the Imperial Research Institutes, *viz.*, by technical and scientific departments making a reference to the Imperial Research Institute before the work is taken in hand. Co-ordination of
research.

Q. 75.—The activities of the Science Congress have possibly led to enquiries being held by Government in matters relating to improvements.

Q. 76.—With the establishment of Imperial Research Institute the deliberations of the Congress may be referred by that body to the Imperial Institutes for consideration and action.

Q. 84 to 88.—Trade and industrial journals should certainly receive the encouragement and support of Government as they are most useful in providing information to those who are connected with industries. The monographs written from time to time on Indian silks, and vegetable dye stuffs, procurable in the various provinces, have been useful to me in my particular line, *viz.*, in the promotion of the hand loom weaving industry of Bengal. I have no doubt that similar publications on other subjects have been equally beneficial to those who have needed them. The dissemination of information of this kind through the various vernaculars would be of use to the artisan classes. Industrial and trade
journals.

ORAL EVIDENCE, 6TH DECEMBER 1916.

President.—Q. I understand that you are a mechanical engineer with experience in weaving?—A. Yes, I am a mechanical engineer, I also know weaving and I have served my time in the mills.

Q. When did you come to India?—A. In 1907 I returned to India.

Q. Have you been in charge of the Serampore Weaving institute since 1907?—A. No, I came out on a three years agreement for the firm of Greaves Cotton and Company and although I had seen the authorities in South Kensington in 1906, I did not get my appointment till November 1908.

Q. You have answered most of the questions. Did you read the instructions which were issued with the questions in which witnesses were asked to confine their evidence to matters within their actual experience. Do you want us to suppose that you have experience of matters referred to in all these questions?—A. Yes, I think that as far as the questions concern industrial and commercial work and my special line of business.

Q. We know that most of the questions have some bearing or other on industries, including that in which you are a specialist. Your evidence has been swamped by your giving advice on questions that are not obviously within your experience and I cannot see how many of them will help us in any way. In answer to question 13 you say that Government aid should be given merely to promote and strengthen existing and decaying industries not with a view to competition but to stimulate and revive their conditions. That is a very obvious statement to make, but we have to advise Government as to practical steps. Then again in answer to question 22 you say that the Imperial Research Institute should be given facilities for benefiting by the results of research work in the United Kingdom and that this may be conveniently done by affiliating the two institutes. What two institutions are there?—A. As regards the practical steps to be taken I could suggest suitable measures to stimulate and revive decaying industries if necessary. I refer to the Imperial Institute which I proposed should be established and its affiliated provincial institutions.

Q. You mean one here and one in the United Kingdom?—A. No, I mean an Indian Imperial Institute and the others referred to are the provincial institutes which should be closely connected with each other and affiliated to it.

Q. In answer to Q. 75 you say that the activities of the Science Congress have possibly led to enquiries being held by Government into matters relating to improvements. Do you know of any enquiries?—A. I think there have been several enquiries constituted from time to time but I cannot at the moment remember the nature of them.

Q. There is no use in stating a matter in general terms. It is much better to confine your attention to points in which you could give precise evidence. Weaving is obviously in your line. You have done a good deal of excellent work in Bengal. We should like to hear your views in the matter of training that can be imparted with a view to saving the weaving classes of Bengal from the effects of the power loom and whether there is any hope of doing that. They are a very large class? Mr. Low will ask you some questions as to what you are doing and what results have been obtained in trying to develop this weaving industry in Bengal.

Mr. C. E. Low.—Q. Have you any idea of the hand loom weaving population of Bengal?—A. We might take their number at about 12 lakhs.

Q. You mean actual workers?—A. Yes.

Q. You speak of a number of cases in which bhadralog students of your factory attempted to start small weaving factories. Did they work with their own hands or did they employ artisans?—A. In most cases they have had to start the factories themselves and afterwards to engage weavers to work the looms. In the case of Hattersley looms, the ordinary weaver does not know their mechanism. These bhadralog young men have had to put up the machinery and to teach the people before they started the factory.

Q. Are any of these collections of looms working successfully now?—A. Yes, I think a few of the factories are still working. Many men started but owing to the lack of working capital several of them had to close down.

Q. The artisan weaver has not much working capital?—A. No, he gets his capital really speaking from the mahajans.

Q. When you get a somewhat larger organisation, you want working capital and this they could not get?—A. That is the main reason of the failure of these factories.

Q. Is there any class of textile hand loom made goods in Bengal for which there is a big organised demand?—A. There is a great demand for silk cloths of all kinds, cotton chudders, saris, dhoties, and the coverlets used during the cold weather in Bengal.

Q. Who markets the products of the hand looms?—A. It all depends upon the financial status of the weavers but as a rule the mahajans market them. In Serampore we have five or six mahajans who buy up all the products of the looms and sell them at about pooja time. It is the same thing in Bankura, where there is a big business done in chudders. Similar conditions exist in the other districts of Bengal, Chittagong, Pabna, Malda, Kushtia, Nadia, etc.

Q. What connection have you had with the co-operative credit movement of Bengal?—A. I have had practically nothing to do with it, except that I assisted in opening some co-operative societies.

Q. Do you know the extent to which there are co-operative societies among weavers?—A. I do not think there are very many societies in Bengal. There may be just two or three at present working satisfactorily.

Q. I do not mean societies for co-operative purchase and sale. I mean credit societies which get money lent to weavers?—A. I believe there are only two or three such societies.

Q. You seem to express the opinion that technical instruction should precede co-operative organisation. Have you considered the possibility of doing it the other way round?—A. I am of opinion that co-operative societies should first be started.

Q. I agree with you but you have expressed the contrary opinion. That may be due to the paucity of co-operative weaving societies in Bengal?—A. That may be a clerical error, but really speaking co-operative credit societies should be started first, and if this is not done we cannot possibly expect to gain the confidence of the artisans, nor will it be possible to induce the artisans to purchase improved machinery without the necessary capital.

Q. What is your organisation for demonstrating the results of your work?—A. In addition to the central institution at Serampore, we have got five outlying district schools, through the medium of which the weavers in the districts receive instruction in improved methods of weaving with modern machinery. The results obtained in promoting the industry have been very satisfactory.

Q. Don't you think that in the matter of teaching a particular process, demonstration is a more ready and extensive way of doing it?—A. Yes, I quite agree with your views and that is what I have suggested also to my department.

Q. Why is there not a demonstration staff attached to the factory?—A. Attempts have been made to obtain sanction from Government from time to time but they have not been successful.

Q. Can you tell why Government did not favour the idea?—A. I have no idea. The Superintendent of Industries sends up such cases for the orders of Government.

Q. Where are the five schools you refer to?—A. One at Bankura, one on the Burma frontier, one at Pabna, one at Malda and one at Tangail.

Q. Do these schools move about?—A. The original idea was that they should move about from village to village in each district till the weavers of the districts had learnt the work and eventually to develop into a district school.

Q. Do you know of this peripatetic system in the United Provinces?—A. I have not connection with the United Provinces at all, but the teachers-in-charge of the weaving schools there have been recruited from my institution.

Q. Do you get the report of the Director of Industries of the United Provinces?—A. I don't.

Q. You say in regard to co-operative credit, that the laws and rules of co-operative credit societies require modification. Could you give any examples?—A. For instance the weavers of Bengal are accustomed to a certain system of obtaining their raw material on credit and of borrowing money, which has been brought into practice by these mahajans, and now if co-operative societies could follow on those lines, and become benevolent mahajans, I think the weavers would more readily accept the ideas of co-operation as these methods suit them. Further the mahajans take over the woven cloths from the weavers, whereas the co-operative societies do not, with the result that the weaver is expected to do his own buying and selling which he is incapable of doing.

Q. That is true all over India and that is one of the reasons why co-operative credit was started. That does not seem a reason for modifying the co-operative rules but for changing the attitude of the weavers?—A. In Bengal, for instance, take the weaver's societies. I do not know if there are any special rules suitable for weavers. The authorities simply give the money to the weavers and it is very difficult to recover it from them. This is all what the co-operative societies have hitherto done, and under these circumstances no artisans could be induced to sever his connection with his mahajans although they are at times very hard on them.

Q. You suggest the desirability of Government guarantees to the higher forms of co-operative banks. Are you aware that this has proved unnecessary in any other part of India except Bombay?—A. I do not know. But Government guarantees will undoubtedly attract larger capital.

Q. You have a provincial bank in Bengal. It has not got a Government guarantee?—A. No. It has not.

Q. What is your reason for suggesting that. Do not they get enough money?—A. I have often discussed this matter with capitalists and I find that they seem to think that their money is not quite safe, while on the other hand if they got some guarantee from Government more capital would be invested in these banks.

Q. There is a certain amount of outside supervision exercised at present. Don't the people attach much value to it?—A. They do attach some value but the facts that these banks have not attracted more capital from local men shows a lack of confidence.

Q. What do you do outside your school?—A. I have got five district weaving schools and some technical and industrial schools which I have to inspect twice a year. I have also to inspect some mission weaving schools, such as the industrial section of the Kalimpong Homes.

Q. Do you get any opportunity to see what your ex-students are doing?—A. Yes, I do occasionally as I inform them beforehand when I visit a station. The students come to see me and inform me in case they have any difficulties, as the time would not permit of my going to the villages to see what they are doing. The teachers of the district schools are also in touch with their men, as when the students from the district schools bring their products to the local markets, they also pay a visit to the schools.

Q. Do the masters of the weaving schools try to keep themselves in touch with the students of the outlying parts?—A. They do, as far as it is possible.

Q. Do you know how these students are generally doing?—A. As far as the artisan are classes concerned we have no trouble as after they have finished their course of instruction at the schools they are able to earn a rupee or two more than they did before.

Q. How do they manage to get hold of these improved looms?—A. At these various district board schools we have raised funds by subscriptions for the purpose, but they are not very large. We have obtained these funds by local subscriptions and we advance them rupees five or ten for the purchase of a loom and recover the money in easy instalments. Recently Government has also sanctioned a scheme for this purpose but it has not been brought into force yet.

Q. Are they being taught on one kind of loom?—A. No, there are different kinds of looms at the schools and they choose the one they like best, and what they think will suit them.

Q. Do they themselves select?—A. They know their requirements better than the teachers, and when they take a fancy to a particular kind of loom, it is very difficult to convince them to the contrary.

Q. Has it been necessary to provide a market for what the weavers have made?—A. Not always, but the lack of a steady market is a great drawback in the cases of most of these weavers. They live a hand to mouth existence and, as a rule, sell all their cloths to the mahajans, who keep them in their grip.

Q. Do they turn out better cloth with the improved loom?—A. They do, and as far as the production is concerned a larger output. They also turn out a better class of material, with fancy designs which assist them to sell their stuff better, and more easily.

Q. You never had any idea of an organisation for placing them in touch with the market?—A. The subject has been brought up, but nothing has been done so far.

Q. Has any use been made of the commercial museum in this respect?—A. No.

Q. There is a commercial museum here, which stocks a number of articles made by industries in this country, and they try as far as possible to advertise the fact among people who are likely purchasers?—A. As far as the artisan classes are concerned they have no opportunities of going to the commercial museum and possibly they would find great difficulty in approaching the authorities of the museum, I think that it will be far better to have small museums in each district headquarters station. The products, natural and manufactured, should be exhibited at these little commercial museums, and alongside of them imported articles for which there is a sale should be exhibited.

Q. These articles are purchased by people from outside Bengal who come once a year?—A. They come sometimes about two or three times a year. In some districts they come only once.

Q. Do the mahajans export?—A. I do not know whether they export. But I know they dispose of the goods, they buy from the weavers and sell them possibly at Calcutta.

Q. Take the case of Tangail in the Mymensingh district. What sort of loom do the weavers use?—A. It is the ordinary indigeneous loom, the same kind of loom that is used generally throughout Bengal. At the school the students are instructed to use some two or three kinds of fly shuttle looms.

Q. Have these men obtained employment other than as instructors and so on?—A. A few of them have found employment in the mills, others in commercial houses, and some as weaving instructors.

Q. None of these students tried their hands as weavers?—A. All the artisan students work as weavers at their homes or in factories, but as far as the higher class students go they naturally aim higher and prefer lucrative employment.

Q. You speak of industrial surveys. Do you know any case where any practical action has been taken as a result of an industrial survey?—A. Yes, as an example I may mention Bihar and Assam. The authorities after my survey of these provinces have accepted my proposals to some extent, which have resulted favourably in some quarters.

Q. You have some remarks about the usefulness or otherwise of exhibitions? What instances have you had personal experience of?—A. Yes, a few years ago exhibitions were organised in Bihar and Orissa where we were always asked to demonstrate improved methods of weaving as well as improved machinery.

Q. Were you in a position to sell any looms?—A. We offered to put enquirers in touch with the sellers. We never actually sold.

Q. Do you know if any sales were effected?—A. On my return to headquarters I received several enquiries but whether they resulted in business or not I cannot say.

Q. Bihar and Orissa had no means of providing demonstration in the use of such looms?—A. Yes, we had weaving schools established there, before the reconstitution of this province.

Q. Who is in charge of these schools?—A. At present the schools in Bihar and Orissa are under the Registrar of Co-operative Societies.

Q. Did you see the Allahabad exhibition?—A. No.

Q. What is your opinion about the view that exhibitions are not of much use unless you have got at the same time an organisation to demonstrate locally?—A. These exhibitions would be very good if they were properly managed and if the leading people of the districts could be

made responsible for the sale of suitable machinery to the ryots over whom they generally have influence.

Q. What do you mean?—A. There are generally a number of zamindars and other local gentlemen who have a lot to do with these exhibitions, if the district officer made them responsible to some extent to induce purchases among their friends and the ryots; these exhibitions would be very useful.

Q. We have had before us evidence to show that there are very many industrial schools in Bengal, and that if all these were put under a Director of Industries it looks very much as if he would not be able to do anything but inspect them. Do you know anything about the position of such schools in Bihar and Orissa?—A. Yes, as far as the Bihar and Orissa schools are concerned they are not so numerous. There is no expert authority to supervise them at present except the Registrar of Co-operative Societies who goes round to inspect them sometimes. The technical schools are supervised by the Principal of the Bihar School of Engineering.

Q. Do you think that it would be possible for the Director of Industries in Bengal to attend to the ordinary work, and at the same time inspect the various schools and control the expert staff?—A. Yes, I think so, but he must have proper staff of at least two or three expert inspectors to assist him.

Q. You would have men for inspection work doing inspection and nothing else?—A. Yes, I think the inspecting officers should not be burdened with too much office work, most of their time should be devoted to inspection work, and to promoting industries which are on the decline. What I mean is that the inspecting officers should be given more time to attend to their legitimate duties rather than to be confined to their offices, for the want of a competent office staff.

Q. Do you not think that you unduly cripple the expert when you draw him away from his legitimate work. Do you think he could be entrusted with the work of inspection?—A. Yes, if the work was not too much for him, that might be done.

Q. We might have the distribution on territorial lines?—A. Possibly that may do. In my case I cannot go into the villages, as I can spare very little time for such inspections besides my other duties of lecturing, etc.

Q. Do you think it would be the best plan to have the more responsible officer to do the outside work?—A. Yes, but who will do the office work then, which requires expert knowledge also.

Q. A very inferior type of man could do that?—A. I do not think so as many intricate problems constantly arise which require expert knowledge to solve.

Q. That requires merely theoretical knowledge which many men possess. But for administration and for demonstration you want a higher paid officer?—A. It may be so to some extent.

Q. Can you think of any industries which the Director of Industries might concentrate his attention on?—A. In Bengal hand loom weaving plays an important part. The tanning of hides, oil pressing, rice hulling and also sugar manufacturing have a great future in this province and these industries should be encouraged and more efficiently worked.

Hon'ble Pandit M. M. Malaviya.—Q. Where were you employed before?—A. I was last employed by Messrs. Greaves Cotton and Co. and I came out for them on a three years agreement.

Q. What was the nature of the work for which you were engaged?—A. It was chiefly commercial work, such as the selling of engines and boilers, etc., and estimating for various extensions connected with mills.

Q. Had you any previous connection with the weaving industry?—A. Yes, I have been through a regular course in the mills. I rose to the positions of carding and spinning master and manager in the cotton mills. I have also long been connected with the weaving industry.

Q. You say that India once held a commanding position in the industrial world, and that she has now lost it owing to the apathy and conservatism of her people. Do you seriously think that it is due to the apathy and conservatism of the people that the industries of India were lost?—A. Yes, I think so. The chief reason being that it is very difficult to get the people to adapt themselves to new conditions or to make them accept any improvements, although they may be perfectly convinced of their superiority. In the case of the fly shuttle looms for instance it has been very difficult to get the weavers to adopt them, in spite of their being convinced that these looms are far superior to the primitive looms used by them.

Q. You say that the Indian artisan is more than a century behind time in his methods?—A. Even longer than that.

Q. Are you aware that Indian manufactures excelled those of Europe a hundred years ago?—A. I accept that, but as soon as the fly shuttle loom was introduced in Europe about 150 years ago her downfall began.

Q. Are you aware that it was stated in evidence (in 1813) before a Committee of Parliament which enquired into the matter that the cotton and silk goods of India up to the period could be sold for a profit in the British market at a price from 50 to 60 per cent. lower than those manufactured in England, and that it therefore became necessary to protect

the latter by duties of 70 and 80 per cent. on their value or by positive prohibition of Indian manufacture. It is not therefore correct to say that India lost her industries because of the apathy and conservatism of her people?—A. That may be correct to a certain extent but the fact remains that since she did not adopt modern machinery and developments she lost her foreign markets as well as her home markets.

Q. Do you also know that the market for Indian goods was also very much restricted during that time by the action of the English Parliament?—A. I do not know to what extent your statements are correct as I have never before heard such reasons given accounting for the decline of Indian industries.

Q. England with a view to develop her own manufactures passed a Shipping Act which prohibited the goods of India from being imported into England, except in ships belonging to English subjects. In that way the market for Indian goods in England was restricted. Do you now see that the decay of Indian industries was due more to the action of the English Parliament than to the apathy and conservatism of the people?—A. I think it was not entirely due to that, as when the Indian manufacturers found that there was a duty imposed they should have improved their machinery, as other European countries did, and they would then have been able to face competition. Besides this there seems to be no reason why the Indian artisans should have lost their home markets when in India there are no less than 30 crores of people.

Q. But the methods and conditions of manufacture have changed and while much has been done to promote the cultivation of cotton, little has been done to encourage the manufacture of cotton in this country on modern lines. Do you think that is also entirely due to the apathy of the Indian?—A. Yes, I think so to a great extent.

Q. Do you find that people are still unwilling to improve their methods?—A. It is not only my experience as a promoter of industries but it is also the experience of the Agricultural Department and these conditions will exist, so long as the leading people of the country don't meet Government half way, and assist in improving present conditions.

Q. You advocate a system of instruction by means of peripatetic schools. Don't you think that to meet the large demand for trained artisans, you should have industrial and technical district schools also and not rely on peripatetic schools alone?—A. From my written evidence you will see that I have suggested that both should exist side by side. First of all the machinery should be introduced among the artisans through the medium of peripatetic instructors, and when there is a demand for industrial and technical instruction, and more advanced education, technical and industrial schools should follow.

Q. You say that it will be necessary for the Indian artisans to rouse himself to greater efforts in industrial improvements by removing the obstacles which have led to the decline of Indian handicrafts. Do you mean that the means for removing this is the spread of technical and industrial education?—A. In addition to that, the adoption of improved machinery.

Q. And the financing of industries by means of co-operative societies?—A. Yes.

Q. Could you give us the number of hand loom weavers in Bengal?—A. About 8 to 12 lakhs.

Q. You think that with improved machinery, with improved hand looms and a little demonstration in the way in which you have suggested, the hand loom industry has a future before it?—A. Yes, especially if developed as a cottage industry.

Q. Suppose it is worked in small factories?—A. The factories may exist along side with cottage industries since many of the artisans are also partly cultivators.

Q. Don't you think that the power loom will kill the hand loom?—A. That is a very difficult thing to answer. The hand looms exist still in Europe. I think they have got their own particular duties to perform.

Q. Does not the hand loom fabric wear longer and is not the extra cost incurred in buying a hand loom cloth more than made up for by its comparatively greater durability?—A. I think so. People prefer to buy hand loom made goods rather than the power loom made goods. In the majority of cases, however, people prefer to buy something cheap.

Q. You speak of a scheme for the revival of industries. Has it not yet taken shape?—A. Yes, the scheme for the revival of the hand loom weaving industry of Bengal was sanctioned in 1907. The scheme provides a central institution and five district schools. These schools with the central institution are supposed to afford instruction to the weavers of the districts where they have been established.

Q. And do you find that people are coming to take advantage of these schools?—A. The schools are full and artisans are readily attracted to them now although we had a lot of up hill work in the beginning.

Q. You think that this scheme will be an effective method of instructing the masses. But would they not appreciate the instruction better if they had a little general education?—A. No; as all the schools combined do not turn out more than about 200 students a year and this number of 200 is nothing as compared with the masses of the people. If, on the other hand, these district schools were combined with peripatetic village schools the work would be accomplished much quicker, and a little general education would no doubt tend to make the

artisans appreciate the instructions and they would possibly take to improved methods more readily.

Q. You want better means of instructing the masses?—A. Quite so, more effective means at least.

Q. With reference to the training of apprentices, do you think that night schools will be sufficient?—A. Yes, we have got night schools. The apprentices attend the shops in the day and take advantage of the night schools. It might be given a longer trial. I cannot say whether the people will take to it or not.

Q. You suggest that the Director of Industries should have three experts to assist him. What class of men would they be?—A. They should be officers who possess an expert knowledge of the industry or industries they have been called on to promote.

Q. Do you think three men will suffice for a province like Bengal?—A. I think they must have competent staffs under them, otherwise it would be impossible to get along and to cope with the work thoroughly.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. How many years have you been in this post?—A. From the latter end of 1908.

Q. How many schools have you got under you?—A. One central institute and five district schools, besides some technical and mission Industrial schools.

Q. Have you got anything to do with the Salvation Army people?—A. No I have to supervise a section of the Kalimpong Homes, and other industrial schools run by missionaries.

Q. How much are these students able to get after they leave the school?—A. At Serampore I have got two types of men, viz., of the middle classes, and also the actual artisans. The middle class men earn anything from 30 to Rs. 200 per mensem whereas the artisans earn from Rs. 10 to Rs. 20 per month.

Q. Where are they employed?—A. All over India. Some are employed in mills, some as teachers, etc.

Q. Where do they get the yarns? Do you think that the industry is falling only through want of capital?—A. They buy their yarns from yarn merchants at Calcutta. The main causes of the decline of the industry are—(a) The want of sufficient capital, (b) the want of a market. Most of the artisans are in the hands of mahajans who supply them with yarn and take back their woven products allowing them just sufficient money to live. The earnings of a weaver may be reckoned at anything from Rs. 8 to Rs. 20 per mensem.

Q. If there are co-operative societies and if they finance the weavers, don't you think that would help?—A. Yes. Co-operative societies, if managed properly, would assist considerably in replacing the mahajans, but difficulties will arise in the co-operative societies finding markets for the sale of the woven goods of its members.

Q. They can have the co-operative stores where they can sell their goods, especially in big places like Calcutta or Dacca or Mymensingh?—A. Yes. I suppose a certain amount of their goods can be disposed of in that way, but there is no organisation for this purpose.

Q. Are there any dyeing classes?—A. Dyeing classes were attached to the Sibpur Engineering College but they have been discontinued from this year as there were no students.

Q. Do you think there is any possibility for the cotton industry here?—A. Yes. There are three or four mills here.

Q. Where is the cotton?—A. We obtain cotton from Bengal and Assam, and for the finer counts from the Central Provinces and Berar.

Q. Is that good enough?—A. For the manufacture of coarse yarns they use this cotton and for the finer yarns they get the cotton from Central Provinces and from the Bombay Presidency.

Q. Don't you think that it is rather costly to get it from long distances. Do you think they can effectively compete with the mills on the other side of India?—A. I think there is a good chance of the mill industry succeeding. In fact some of the Bengal mills are succeeding quite well.

Q. Do they make coarse cloths?—A. The Bengal mills chiefly manufacture fabrics with medium yarns, spun with local cotton and fine fabrics with imported yarns, that is yarns 40's counts and upward. The coarser yarns are exported or used up locally by the hand loom weavers.

Q. You have got only 200 students?—A. No; I have at present about 100 students in my Central Institution, and on an average of about 200 at the district schools.

Q. Do they get employment easily?—A. I think we have been very successful so far.

Witness here gave confidential evidence.

Mr. A. Chatterton.—Q. As you probably know I have taken some interest in hand loom weaving questions and I shall ask you some questions in detail with a view to get your experiences in these matters. When you first joined the Bengal Educational Service were you informed by the Director of Public Instruction as to any particular policy that you were to carry out?—A. No; I do not think so.

Q. What instructions did you get from Government when you first joined the Educational Department? What were the lines laid down?—A. I was told that I was expected to open a Central Weaving Institute at Serampore and five weaving schools in the most important centres of the hand loom weaving industry. The proposals of the committee appointed by the Government for the revival of the hand loom weaving industry of Bengal which are contained in the Government letter No. 901-T. G., dated 8th June 1904, were given me and I was asked to work out a scheme on the lines indicated in the letter and to open the schools with as little delay as possible. On my arrival in India an assistant principal, a clerk and a drawing master were appointed to assist me and with these officers the Central Institute at Serampore was opened in about a month's time after I took charge. A reference to the letter and the correspondence thereon will show that it merely gave the outlines of the scheme of work, the budget grant and the staff I would get. This scheme of work has since then been modified considerably to suit conditions and to make it workable.

Q. Did you consider it necessary to study the economics of hand loom weaving in Bengal?—A. The original idea was that I should tour through Bengal, but I never had an opportunity of doing so. I was put on starting the weaving institution straight away.

Q. That is to say that you had to neglect the economic side of the question at the outset in favour of the development of the school on its technical side?—A. I had to start the school under instructions and that was my duty. The economic conditions and possible success were probably studied by the committee before it was decided to open a school at Serampore.

Q. In the course of your experience have you come to any conclusion as to whether the lines on which you have been working are satisfactory?—A. The conclusion I have come to is that the industry has a chance of success and that if the fly shuttle loom is introduced amongst the villagers better results may be expected.

Q. But to bring about this result do you consider that the weaving school at Serampore is an essential item in the programme?—A. I think a central institution is very necessary, otherwise it would not be possible to train the middle classes, and also to instruct the more enterprising weavers who would be anxious to receive further training.

Q. Do you consider it necessary to train the middle classes in the Serampore Weaving Institute?—A. I think it is absolutely necessary, as the middle class men may be considered as a link between the artisan and the capitalists.

Q. What is going to be their future?—A. We have been quite fortunate so far as from 80 to 90 per cent. of our boys have been successful in obtaining employment.

Q. In what way?—A. As teachers in factories, mills and as officers-in-charge of the textile departments in Jails.

Q. They are all pursuing the textile trade in some form or other?—A. There may be some instances here and there in which they are not doing so, but generally speaking they are all employed connected with the textile industry.

Q. What would be the percentage of teachers?—A. I just forget, but it may be taken at 25 to 30 per cent.

Q. This is an artificial demand?—A. No; hitherto the demand has been practically constant. For example zamindars constantly want men to train the people in their villages.

Q. You told us that they were averse to doing so?—A. Generally speaking they are averse to doing so but if we can get the leading people in the districts to influence them they readily take the advice and adopt improved methods.

Q. Were those weavers in a better economic position than the weavers in other districts of Bengal where they are using the ordinary pit loom?—A. Yes.

Q. When the advantages of using the fly shuttle loom are so obvious they still won't take up to the fly shuttle loom?—A. No, as they are generally conservative and will not adopt anything new unless influenced by their leaders.

Q. Is there any economic reason why the weavers in the Hooghly district should adopt the fly shuttle loom?—A. It was introduced by the Danes and certain amount of compulsion was brought to bear on them.

Q. My information is that it was introduced into 4 or 5 districts and then it spread voluntarily. Obviously the Danes must have had very little influence beyond Serampore?—A. Yes, the information you have received is correct as the fly shuttle loom is believed to have been introduced first at Serampore and when it proved a success some of the villages also adopted it. In some districts like Bankura they are also used to a certain extent which is due to the Swadesi movement of 1907.

Q. Have you been able to form any idea as to why in certain parts of the country fly shuttle looms are found and that in other parts they will take to them only under compulsion?—A. I think this is due entirely to the zamindars and other influential gentlemen who have introduced the looms and their influence over their subjects.

Q. You think there is no other reason?—A. I think that is the only reason.

Q. Do you think that it is due to economic reasons?—A. Not, so far as I am aware, in the case of Bengal.

Q. Can you tell me what you think would be the necessary working capital for a young man to start a small fly shuttle loom factory, a hand loom factory with, say, ten looms?—
A. Much will depend upon the markets he gets. In Serampore the weavers sell their stuffs only once a year, whereas in other places where there is a constant demand for the cloths a much smaller capital will be needed. The machinery will cost about Rs. 400.

Q. Can you work out in detail what would be the cost of two or three typical factories such as you think could be started here with the prospect of running it successfully, and send it to the Secretary to the Commission?—A. Yes. I could do that.

Witness subsequently forwarded the following statement:

Estimates of the annual cost of installing and working Hand Loom Factories.

1	2	3					4	5			6	7	8
No. of looms.	LOOMS.		PREPARATORY MACHINERY.				Accessories cost.	RECURRING CHARGES PER ANNUM.			Reserve capital.	Working Capital total columns 5 and 6.	REMARKS.

* Q. You say that at the present time there are several weaving factories which are working successfully. Can you tell me where these factories are?—A. You mean in Bengal.

* Q. Anywhere?—A. My students have started hand loom weaving factories in Nepal, at Kasimbazar, at Gomo, at Madras, at Colombo and in several other places in Bengal.

Q. Have you got any accounts of their financial position. Are they working at a profit?—A. I do not know. I get letters from them and they frequently write to inform me that they are doing well. As far as the Nepal factory is concerned it was started by the Raja.

Q. He can afford to lose money. You say that in some parts of Europe hand loom factories have been found to be a success?—A. Yes, in Ireland and France and in most silk growing countries.

Q. Where in Ireland?—A. I do not know exactly the names of the places where the factories are, but several hand loom factories are working in connection with linen trade.

Q. Have you actually seen them or is it only second-hand information?—A. I have not actually seen them but a reference to the official reports on these subjects should be sufficiently convincing.

Q. What improved processes have you demonstrated in the course of your teaching in the school?—A. The primary improvement was the introduction of the fly shuttle loom and the second are the making of warps, sizing, and the introduction of dobbies and jacquards.

Q. Have you any special arrangement for sizing at Serampore?—A. Yes, we do hand sizing and mill warping.

Q. About the difference between the hand woven cloth and the mill woven cloth in respect of durability, what do you attribute the durability to?—A. The cloth seems to lose strength in the process of calendaring.

Q. If you omitted that in the mills?—A. The strength would be practically the same then.

Q. Do you think hand sizing has anything to do with the matter?—A. As far as the size is concerned in both cases the size washes out.

Q. After the cloth is woven?—A. Yes.

Q. Don't you think that the fibres of the yarn are better set by hand sizing?—A. Yes, but the sizing in the mills is also very good.

Q. In the course of your tours did you go to Dacca?—A. I did not go there as I have no school at that station.

Q. Do you know anything about the weaving at Dacca?—A. I have not had an opportunity of going there. The orders I have received are to go only to certain schools. I cannot wander about all over the province.

Q. You say that although you have not been directly concerned in the raising of capital you have started a number of small factories for ginning cotton and so on. Were these under Government auspices?—A. They were more or less commercial enterprises and run by private capitalists.

Q. You have no system here of giving weavers takavi loans or of supplying looms on the hire purchase system?—A. In the district schools we have a small local fund for the purpose of supplying looms to passed students and recently Government has sanctioned a sum of money for it. But the scheme has not come into force as yet.

Q. How do you propose to finance them?—A. On the completion of the students' training we give him sufficient capital to purchase a loom. He signs a bond and later we recover the money from him as prescribed by the Government rules.

Q. It is a kind of hire purchase?—A. It practically amounts to that.

Q. You say that as regards Government pioneering industries you would introduce modern machinery through the medium of co-operative societies or rural banks. Have you got any scheme by which this could be carried out?—A. Yes, as far as the cottage industries are concerned.

Q. How do you propose to do it through the agency of co-operative societies?—A. The co-operative societies should be called on to provide the members of their societies with sufficient capital to purchase improved looms, etc., and these societies should also arrange to take over the cloths woven by the members, should the members be unable to sell the products of their looms themselves then the society should endeavour to sell the goods by contract either to the local mahajans or to the merchants at Calcutta. This experiment has been tried by one or two co-operative societies in Bihar and the results have been satisfactory.

Q. Have you got any actual examples of the co-operative society furnishing the members with improved machinery?—A. Yes, one or two co-operative societies are working on these lines, *viz.*, the Ranchi Union, The Sakoona Society of Bihar Kutchari. The Sambalpur Silk Weaver's Society.

Q. Inside Bengal?—A. Such societies are very few, infact I do not know anything about them.

Q. As far as industries in Bengal are concerned the co-operative movement has not spread to the necessary extent?—A. No. Not as far as industries are concerned, but there are many agricultural societies.

Q. You say that these central and rural banks could be considerably improved if placed on a safer footing by Government? What do you mean by that?—A. The capitalists are at present unwilling to put in their money in the various banks and the money would come in readily if there was some sort of Government guarantee.

Q. You want a Government guarantee?—A. That is what they look to.

Q. You say that many industrial co-operative societies were started but they were not successful. What organisation would you provide for the supervision of these?—A. There ought to be expert inspectors to go round and help the weavers to purchase their yarns economically, to sell their woven products, to check their accounts and to keep them always in working order. Those conditions do not exist here.

Q. Have you had any direct connection with a co-operative society?—A. There is a society at Serampore. That was started by the local weavers. I tried to help them to a certain extent, but the Registrar took the matter out of my hands, and he is now working it himself. He has got his own men to look after the matter and therefore there is no necessity for me to interfere.

Q. Is the Serampore society working satisfactorily?—A. I do not think so.

Q. Would it not have been an interesting experiment for you to have got control over these weaving societies?—A. It was with that very reason that I took the matter up. My convictions are that the Superintendent of Industries should have the control and management of all such industrial societies and he should be made a Joint Registrar.

Q. Have you addressed the Registrar of Co-operative Societies in the matter?—A. He knows my views about it. I have written to him several times.

Q. With what result?—A. He has asked me to take up the management of the Serampore society again.

Q. What do you mean by decaying industry? Do you consider weaving a decaying industry?—A. No, not weaving generally speaking, but the hand loom weaving industry of India. By the word "decaying" I mean an industry which is on the decline.

Q. Are there available statistics in Bengal sufficient to enable you to form any opinion as to whether hand loom weaving is making progress or not?—A. I do not know of any such records being kept in Bengal.

Q. Have you ever looked at the economic side of the question?—A. Yes. The prospects seem favourable as far as hand loom weaving is concerned.

Q. Do you know how much yarn is used by the hand loom weavers in the province?—A. Not exactly, but we get a vague idea from the textile journals.

Q. Have you seen the statistics which have been published in regard to other provinces which tend to prove that the output of the hand loom weavers is on the increase?—A. No.

Q. You say that the district schools have been well attended. I presume that is due to the fact that you give scholarships?—A. I do not think so. The amount is only Rs. 4 a month per scholar. Most of the men are adults. The amount of money that is offered is no attraction to them.

Q. In these factories which have been started by the pupils of the Serampore School besides fly shuttle appliances what other appliances of an improved type have you got?—A. Mill warping, pirning, winding and many other improved appliances have been introduced.

Q. Have they taken to dobbies or jacquards?—A. Yes, some of the weavers have taken to dobby and jacquard weaving and we are now endeavouring to spread the use of them in all districts where dhoty and saree weaving is done.

Q. Are there many in use here?—A. Not many. I could not give you the exact number.

Q. You have some in the school?—A. Yes.

Q. What is your experience of the Hattersley loom with the artisan class?—A. The artisan classes take to these looms very readily but unfortunately they cannot afford to buy them. Some of the more well-to-do men have purchased them.

Q. Apart from the question of cost have you found that it is too heavy?—A. Yes, they find it a little heavy, but with practice they can work at it the whole day without getting exhausted.

Q. You have already mentioned that the great difficulty about the development of the hand loom trade is the question of finding a market. Could you not devote a considerable amount of attention to this particular aspect of the question in the future?—A. Certainly I could, but my present duties will not allow of my doing so.

Q. The imported piece goods trade amounts to many crores a year and there is no difficulty in selling the whole of this through the organised agencies which have been established in the country. What real difficulty is there in creating a similar organisation to deal with the hand woven goods?—A. Hand woven goods have got only a local market and some how or other the industry does not seem to have been centralised, but there seems to be no reason why the local-made goods should not be sold if there was a proper organisation.

Q. If prominent attention were directed to this aspect of the question it is possible that mercantile people might find it possible to take it up. Have you any idea of the output of the 400 thousand looms of Bengal?—A. No, but the value of the goods may be calculated at Rs. 10 to 15 a loom per month.

Q. Then you have an unorganised trade of 7 to 8 crores a year. Would it not be worthwhile to take steps to get it properly organised?—A. Certainly.

Q. Is the whole of this trade a seasonal one or is there a steady demand?—A. Yes, it is more or less a seasonal trade. In some districts however there are biannual and triannual markets, whereas in other places, the weavers sell their cloths at the weekly markets. At Serampore the mahajans place their orders for the whole year with the weavers and recover the woven material from them just before Puja time. The cloths are then washed, finished and supplied to the merchants at Calcutta with whom they have steady contracts for the supply of hand-loom-made sarees, dhoties, and gamachas. The prices of these woven articles are just a little more costly than mill-made goods as the latter are manufactured on a large scale and the weavers find employment throughout the year from the merchants. The merchants also are consequently able to buy their yarns at wholesale rates.

Q. To what extent do individual mahajans deal in this business on a big scale?—A. At Serampore we have mahajans who have got as many as hundred looms each under their control. The weavers who work these looms make a contract with them for a yearly supply of some hundreds of pairs of dhoties and sarees. The weavers are not required to invest their capital at all but limit themselves to the manufacture of the cloths.

Q. Has any attempt been made to get the mahajan to improve the output? What is his attitude?—A. He is a very suspicious person and does not interest himself in any way with improving the machinery or output of the looms as the looms are not his property and the prices at which he manufactures his cloths are quite satisfactory.

Q. Have any of these people taken any interest in the improvement of the production?—A. No, none of the local gentlemen have hitherto made an attempt to improve the production of the Serampore looms but I believe that during the Swadeshi movement some of them came forward to help the weavers.

Q. You say that you are using jacquard looms in the Serampore school. Have any of these been introduced in the districts?—A. There are a few in Bankura and a dobby and a jacquard have recently been purchased by the municipality for the benefit of the Santipur weavers.

Q. Where do they get their cards from?—A. From England in the first instance and afterwards they buy their cards from the local shops in Calcutta.

Q. Where do they get them cut?—A. They cut it themselves.

Q. Have you got a card cutter in your factory?—A. No. We our out cards with hand punches.

Q. Are they using the drawboy type of harness?—A. At Bankura you will see both types—the jacquard and the drawboy.

Q. Have you shown the relative advantages of the two? Have you compared the rate of working?—A. It is not easy to do that in an institution like that of mine, but it has been tested in the various villages. For instance at Bankura where the jacquard has been introduced, it gives about three to four times as much work.

Q. And yet it is difficult to get them to adopt the improved methods?—A. Yes, as the Indian weaver is very conservative.

Q. Could you arrange to sell jacquards on the hire purchase system?—A. We could, but there is no money available for that purpose.

Q. Have you ever applied to Government for funds?—A. I said that a scheme has been sanctioned for the purpose of advancing loans to the students who pass out of the institution and the same money could be used for that purpose.

Q. In regard to the Serampore School can you send us the last annual report?—A. Yes.

Q. What is the annual cost of upkeep?—A. About Rs. 28,000 for the Central Institute and its outlying centres.

Q. What do you do with the products of the looms?—A. We do not sell them. The boys bring their own yarns and when they have woven the material they sell it in the local markets.

Q. There is no commercial side?—A. No, that is one of the reasons why the men come. This system of work has proved an attraction as the weavers are permitted to canvass orders in the market and to sell their material after defraying the cost of the yarn.

Q. How much was the capital outlay on the institute?—A. For the purchase of the machinery and furniture the initial capital was Rs. 6,000.

Q. How much has been spent since?—A. Very little.

Q. All your equipment cost only Rs. 6,000?—A. Yes, that is all.

Q. You speak of your deputation to other provinces?—A. I was deputed to Assam and Bihar and Orissa twice for inspection work and also to report on certain matters that interested the Government there. I was sent also to the Indore State last year.

Q. In answer to question 55 you say that all those in charge of prime movers should possess Government certificates of competency? Is that statement based on practical experience?—A. Yes. I think it very necessary as unless these men are of a certain standard the general tendency of the employers is to procure cheaply paid men who are as a rule incompetent, and there is always a danger of their doing damage. It is necessary that there should be some Government control.

Q. Would you have Government control to prevent your servants from breaking your crockery?—A. That is quite a different matter.

Q. Why should not a private individual be allowed to employ whom he pleases to damage his own machinery?—A. The public are also concerned. If a boiler bursts for instance there is danger to life.

Q. In the case of small prime movers don't you think it would be a great handicap to their owners if you insist on the employment of drivers with Government certificates?—A. On the other hand it is a great safeguard, but an exception could be made with small prime movers, such as oil engines, etc.

Q. Do you want a certificated man in the case of small pumps and engines?—A. No, in such a case a third class driver would do if he understood the working of an oil engine.

Q. On what pay?—A. It depends on the place. In some places they get 60 or 70 rupees per mensem. In other places only 20.

Q. In Madras there are hundreds of drivers on very small pay in some instances as low as Rs. 7?—A. They are simply coolies, and the owners of the plants invariably realise that economy of this nature is really no economy in the long run.

Q. Do you know whether in England people in charge of prime movers have to be certificated?—A. The conditions are different there. Such men cannot become engineers all at once. The proprietors would not allow him to take charge of the factory unless they were convinced that he was thoroughly reliable and experienced.

Q. In your experience how many machines have been damaged by these men?—A. I know of four or five instances, but I could not tell you exactly the number of such cases. I have had a lot to do with the selling of machinery in the Central Provinces, Madras and a portion of the Punjab.

Q. Would you apply the same regulation to an oil engine for instance?—A. Oil engines are excluded as with these prime movers there is not the same danger of explosions as in the case of boilers.

Q. Would you eliminate the oil engine?—A. Yes.

List of Hand Loom weaving factories opened by ex-students of the Serampore Weaving Institute forwarded by Mr. Hoogerwerf, after oral examination.

Serial No.	Names.	Address.	No. of Looms.	REMARKS.
1	Nalin Behary Nandy.	Sahagunj, Hoogly	1 Hatter-sley's and 3 Fly Shuttle Looms.	He closed his factory after working it for about a year and a half as he found that he had not sufficient working capital. The cloths turned out in his factory were quite good and commanded a fair sale.
2	Nirmal Chandra Mukherjee.	Eron'i, Murshidabad	5 Hatter-sley's Looms and preparatory machinery.	This factory is financed by the Maharaja of Kasimbazar. He is weaving silk cloths for which he has a sale at Calcutta.
3	Srinibas Saha	Bhadreswar, Hoogly	6 Looms.	He closed his factory after working about a year as some dispute arose among the share-holders.
4	Bijoy Krishna Mukherjee.	C/o Brothers Partners, 10, Sukea's Lane, Calcutta.	6 Looms.	He closed his factory for want of funds after working for about 2 years at Gomoh.
5	Debendra Nath Lahiri.	C/o Station Master, Coomerkhaly, E. B. Ry.	4 Looms.	He has just opened his factory.
6	Haripada Hans	Post Office and Village Badanganj, Hoogly.	3 Looms	He has installed three looms at Badanganj with his own capital and sells the products of his looms to the local merchants. He is believed to be doing quite well.
7	Atal Behary Nandy	Post Office and Village Badanganj, Hoogly.	4 Looms.	He has installed three looms at Badanganj with his own capital and sells the products of his looms to the local merchants. He is believed to be doing quite well.
8	Hem Chandra Dalal	Post Office and Village Badanganj, Hoogly.	2 Looms.	He has installed three looms at Badanganj with his own capital and sells the products of his looms to the local merchants. He is believed to be doing quite well.
9	Manick Chandra Nandy.	Post Office and Village Badanganj, Hoogly.	3 Looms.	He has installed three looms at Badanganj with his own capital and sells the products of his looms to the local merchants. He is believed to be doing quite well.
10	Bhusan Chandra Das.	Post Office and Village Kayapat, Hoogly.	3 Looms.	He has installed three looms at Badanganj with his own capital and sells the products of his looms to the local merchants. He is believed to be doing quite well.
11	Moti Lal Laha	Lal Bagan, Chander-nagore.	2 Looms.	He closed his factory after working a few months and went to Nepal where he is running the State Hand Loom Factory quite creditably.
12	Kenaram Mahapatra	Village Belda, Post Office Potaahpur, District Midnapore.	5 Looms.	He has opened a factory with 5 looms but no information is to hand as to what success he has met with.
13	Kishory Mohan Taldi.	Village Makulpore, Balasore.	2 Looms.	He has been working since the last 4 years and weaving fine dhooties and sarees which he is able to sell at good prices to the local shopkeepers.
14	Purna Chandra Paramanik.	Paipara, Santipur, Nadia.	2 Looms.	He is employed in the weaving of handkerchiefs with ornamental borders and he states in his letter that his average earnings amount to about Rs. 20 per mensem.
15	Narendra Nath Barick.	Santipur, Post Office Hatigarh, Balasore.	14 Looms.	He is employed in a factory opened by the missionaries at Hatigarh.
16	Muhammad Yunus	Sohdeeh, Post Office Soharai, Bihar, Patna.	2 Looms.	He closed his factory after working it for few months as he had no working capital.
17	Jaykrishna Das	Silk Factory, Bhagal-pur.	12 Looms.	It is rumoured that he has opened a silk factory in partnership with a Marwari but no advices are to hand as to what success he has met with.
18	Sarat Chandra Chowdhury.	Village Jote, Post Office Kotwali, Malda.	2 Looms.	He opened business with 2 looms but he had to discontinue his work as his house was recently burnt down.
19	Raja Ram Bhar	Begampore, Hoogly.	2 Looms.	He is working conjointly with one of his friends.

List of Hand Loom weaving factories opened by ex-students of the Serampore Weaving Institute forwarded by Mr. Hoogewerf, after oral examination—concl'd.

Serial No.	Names.	Address.	No. of Looms.	REMARKS.
20	Aidan Coomer .	D. U. Mission, Chittarpore, Hazaribagh.	6 Looms .	This factory was opened by the D. U. Mission, Chittarpore, some years ago and after working it for some four years it closed down as it was found that it did not pay.
21	Sital Chandra Seal .	Khasbagan, Serampore	2 Looms .	Not working satisfactorily.
22	Haladhar Paul .	Thana Battala, Dutta Bagan Lane, Serampore.	4 Looms .	He has been working satisfactorily all along. He sells the products of the looms to the local merchants.
23	Dina Nath Dey .	Thana Battala, Dutta Bagan Lane, Serampore.	3 Looms .	He is working on his own account.
24	Panchanan Adar .	Thana Battala, Dutta Bagan Lane, Serampore.	2 Looms .	He is working on his own account.
25	Sashi Bhusan Gui .	Cemetery Lane, Serampore.	2 Looms .	He is working on his own account.
26	Nibaran Chandra Das .	Post Office Begumpore, Hoogly.	3 Looms .	He is working on his own account.
27	Hopra Hembrom .	Wesleyan Mission, Bankura.	6 Looms .	He is working as the Manager of the Wesleyan Mission Factory. The factory is paying for itself and the number of looms will shortly be increased.
28	Gopal Chandra Dutta .	C/o Babu Adhar Chandra Dutta, Serampore.	2 Looms .	Working on his own account. He manufactures fine dhooties for which there is a local demand.
29	Kali Krishna Roy .	Beliatore, Bankura .	3 Looms .	Working satisfactorily.
30	Thako Hari Chowdhury .	Suri, Birbhum .	2 Looms .	He failed on account of financial difficulty.
31	Lalit Chandra Nath .	Belka Post Office, Village Trimohini, District Rungpore.	2 Looms .	He has recently opened a factory with a couple of looms but nothing definite is known as yet about him.
32	Banchanidhi Dhal .	Dongara Post Office, Cuttack.	About 6 Looms.	He has recently opened a factory with 6 looms in the hope of being financed by one of the local zemindars.
33	Surendra Nath Barvi .	C/o Reverend D. C. Haldar, Ramgarh (Chittagong).	2 Looms .	He has opened a factory with 2 looms.
34	Muhammad Asim .	Gulzarbagh, Bankipore.	6 Looms .	He worked his factory for 6 months then closed for want of capital.
35	Satish Chandra Mitra .	C/o Roy Bahadur Purnendra Narayan Singha, Bankipore.	20 Looms .	He closed his factory after working for about a month owing to the disagreement of the partners.
36	Satish Chandra Chatterjee .	Manaha, Khulna	He failed on account of financial difficulty.
37	U. B. Dolapihilla .	Rajagiriya, Colombo.	About 15 Looms.	He has started a hand-loom weaving factory with some 15 looms. The factory is financed by small capitalists and from recent advices to hand I understand that the factory is a success and that power machinery will be installed shortly.
38	Khader Ali Khan .	Bunganapalli (Madras)	25 to 30 Looms.	He is supervising the Bunganapalli State Weaving Factory which is working very satisfactorily.
39	K. Swamy .	C/o K. Veerabhadra Sastry Esqr., Vizianagaram City (Madras).	More than 10 Looms.	He is doing quite well and has hopes of increasing his present plant.
40	V. V. Narayan .	C/o F. R. Raghunath Rao, Esqr., Rajah's College, Parlakemidi.	10 Looms	He died ; I don't know who has taken over the charge of the factory.

WITNESS No. 115.

Hon. Mr. W. W. Hornell.

THE HON'BLE MR. W. W. HORNELL, *Director of Public Instruction, Calcutta.*

WRITTEN EVIDENCE.

Apprenticeship and industrial schools.

1. One of the points dealt with in the questions circulated by the Commission is that of apprenticeship and industrial schools. I understand that Mr. Chatterton's view is that the raw materials of an industrial organisation are not lacking in India; that there is plenty of capital, if only it could be brought into action and that the labour available is industrious, but that the deterring cause is to be found in the fact that industry is divided into two small units. The work is split up amongst individual workers and their families, whereas modern conditions demand larger units of organisation, a minuter sub-division of labour, more regular hours of work.

On the other hand, the labourer finds the sub-divided process monotonous: he dislikes the regular hours: dislikes leaving his family circle to go to work and wants to work at home. It is difficult to make him realise that in return for these minor disadvantages his hours would be shorter and his earnings greater!

2. There have been three main types of proposals for bettering the condition of the Indian craftsman. The art amateur would revive the past: he disapproves of modern machine-methods. His proposals are not practical. A critic of another class would introduce pure European industrialism, and despises any small-scale effort: this sort of person does not realise that in many, if not in the bulk of, cases highly capitalised industry on European lines is not possible; that there is not the volume of trade to make it succeed, whereas there might be quite sufficient to bring success to a smaller concern. In any case trees grow from seeds and an intermediate stage of small-scale enterprise might lead eventually to a larger industrial system by developing an export trade from one originally confined to a local market. To start the large export business straight off would involve unnecessary risk. If we are to wait for large industrial development in India we may wait for ever! "We must lead up to it" says Mr. Chatterton. Hence Mr. Chatterton's view is that a number of workmen should be gathered into a small factory where they can make common use of a small engine, of improved machinery, of common design and information (in the supply of which Government might assist), of a central sale and purchase agency shared between several such factories.

3. Experiments were made on these lines with some success. The difficulty which arose was the question of the limits of Government interference. Is it justifiable that Government should finance industry? Is it justifiable that it should finance and manage? Should it merely finance without having any say in the management?

4. I am not going to discuss these questions: I am not a business-man; besides they have been discussed at great length already and the Secretary of State has written more than one Despatch on the subject. It is not quite clear to me what the present position is. If there is any real vagueness as to the accepted principles by which the Government of India is to be guided in dealing with this difficult matter, the vagueness should be removed. My attitude, for what it is worth, is that of the recent Bengal District Administration Committee. If Government can contribute to the development of Bengal by means other than educational, doctrinaire opinions should not be allowed to stand in the way. The means I leave to others, but I think it is unwise to ignore in a matter of this kind the apparently inevitably cumbersome nature of Government machinery. Surely if Government is ever to do anything like commerce it must be able to act promptly. Is this possible?

5. To resume:—In his "Industrial Evolution" Bucher points out that Europe reached its present economic and industrial condition through a number of stages. The earliest form of industry is *house-work*. The house owner makes for himself: there is no specialisation or barter. This stage does not postulate village life: it is "home industry." Differences of endowment lead to excess in some cases, deficiency in others. Hence barter which implies the existence of neighbours. Village life develops and a man with a special gift may decide to live by that gift, abandoning the land. He works on the purchaser's material. Where the tools are bulky, e.g., a loom, the material is brought to the worker; in other cases the worker goes to the employer's house. This is *wage-work*. The next stage is reached when the worker purchases material, works all the year round, and sells the finished article for a price. This is called *price-work*. It postulates the existence of a town and it depends upon the personal touch between the maker and the purchaser. Hence the town must be small. The difficulties of the small man in capitalising himself, in tiding over the slack seasons, and in finding the money for the purchase of materials at the right time, introduce the middle man and *commission work*. The middle man becomes the sole customer: hence the worker loses direct touch with his market. This stage assumes a group of towns. The existence of the factory assumes national trade. It arises rather from a sub-division of labour than from machinery. It is more economical than individual workmanship, but it is not very adaptable either in the nature of goods or in the quality produced.

6. Where should India be placed in this development? Is it necessary that its industrial life should follow these stages? We find in Bengal a strange admixture of stages. House-work is rare, but still exists: a good deal of the cloth woven in the house is for home use. The goldsmith is an instance of wage-work. The brass-worker is an instance of price work. The potter is a commission worker. In jute, cotton, steel, we find the factory on a large scale: in soap, printing, jewellery, we see the small scale factory.

7. Reviewing the average *mofussil* conditions of Bengal it may perhaps be said that for the most part industry is in the stage of wage work or price work, but that the system is modified by the existence of cheap imports and the retail trader. Mr. Chatterton's proposal would be to substitute commission work and the small factory. The dangers of commission work are the fact that the worker is out of touch with the market. The continued existence of the small local worker is largely due to the fact that he is closely in touch with the market.

8. Then again there is the danger of the middleman. He is often oppressive. I am told that there is in East Bengal the germ of a useful little manufactory of shell buttons, but that the cost of the middleman is so excessive that the doom of the trade is inevitable.

9. Both the above dangers might be avoided by official control. Is this the sort of thing which the Industrial Bureau could control and is it likely to be capable of controlling

it? The value of the trade of any one small factory is microscopic: the workers are suspicious of the official as a new middleman who will enter and take an additional toll. It would seem as if the small factory and commission work is really a transitional stage in development containing elements which render early development or early decay inevitable.

10. There is an even more serious consideration. We find the wage worker, the commission worker or small factory, and the large factory in the same province. But they are not found in the same place. The wage worker is situated in the far-away village: the small factory is in the *mofussil* town: the large factory is in the city. Between these three there are centuries of social development. The type of industry is suited to the type of social life.

11. In endeavouring to make a small factory out of the village weaver, we are perhaps endeavouring to take an institution out of one social stage and place it in another era. It may be possible by building a railway by erecting a new steamer halt, by a new road, to make a village into a small town. Then the wage worker automatically tends towards piece work, and, as the town grows, he becomes a small factory owner. But the attempt to change the industrial type without real alteration of the social conditions seems foredoomed to failure.

12. At the same time one must admit the possibility that in some cases the social conditions may exist which render the small factory possible, but that indolence or lack of initiative have prevented its growth. It has been argued that Government might step in here. Has Government any right to step in, unless the chances of success are at least good? If any one was thinking of investing money in an embryo industry, he would ask a certain number of questions, *e.g.*

what would fuel cost?

what would transport to the customer cost? or if a middleman is employed transport to the distributor?

what would the plant cost? and finally

what would the capital cost?

13. An industry of this kind is bound to be a more or less risky venture; whereas moneylending to agriculturists is comparatively safe. A co-operative bank, which is, I am told, one of the safest investments going, if reasonable care is exercised, will pay 7 per cent. A slightly risky loan to a *ryot* is a less risky and a far more profitable investment than the factory, why then invest in industry?

14. I am exceedingly sceptical about the capacity of an external Director of Industries or Bureau to detect the possibilities of a small industry. The task would be, to say the least, one of extreme difficulty. The education of the people to detect for themselves would be a more reliable policy, but I should hesitate to say that it were practical. The man who lives in the small town and knows its requirements both in quality and quantity has a far better chance of seeing any opening which may offer. It may be that he may be too indolent to use his chance; but is there not a certain risk in that same indolence affecting the activities of the Bureau or the Director of Industries. There may be members of the Commission who have not toured in Bengal during the rains.

15. In spite of these objections it may be worth while to pay attention to the small factory, if future industrial development is likely to lead through it. It has been suggested to me that we might have an era of small factories, leading eventually to a fuller industrial development. I have my doubts, but I can realise that small scale production may arise from several causes. (i) A localised market, *i.e.*, the production of cloth on a lonely island cut off from every other part of the world would necessarily be on a small scale. I once saw a small factory in Bhola for the production of vests, etc., which seemed to be paying its way. (ii) A specialised demand, *i.e.*, the people of a certain district may desire a certain class of article which no one else needs, *e.g.*, the peculiar breast cloth of the Chakma woman of the Chittagong Hill Tracts would be a case in point. (iii) A perishable product, which may be produced near its market, because the additional costs of small scale production are less than the risks and costs of transport.

16. The earliest development of industry was accompanied by the opening up of communications and a gradual widening of the market. As the market widens, the factory increases in size, but the opening up of communications now-a-days puts an isolated part of the country into touch with the whole world. A small local artisan does not swell to a shop, thence to factory. He is apt to be faced suddenly by world products and then he usually disappears unless he develops into a factory supplying the world.

17. It looks therefore as if the factory arose not so much from improvement in the method of supply as by alteration in the nature of the demand. Improved communications, increase of population, development of education leads to an increasing similarity in taste. Men are much more like each other now than they even were before. Their tastes and their thoughts are becoming standardised; hence also their needs. This standardisation of demand makes possible the standardisation of supply. Can we suppose that time will accentuate local differences? I am afraid not: Local fads are an unstable basis for long-lived industrial hopes. It looks as if the perishable product, such as pottery, is the only one likely to rest with the small producer and there again the tendency of modern production is to displace the perishable article. We have enamel vessels, unbreakable glass, non-chip plates, and canned food!

18. One might have expected that Bucher in tracing the development of industry through marked stages, would also have pointed out that each stage of industry has an educational method peculiar to itself. In the early stages hereditary apprenticeship develops. With the advent of the small town where many different trades are gathered together it becomes possible for the parent to set his child to learn some other craft than his own. Moreover it becomes desirable for him to do so; for in the small town, unlike the village with its one official craftsman, overcrowding of crafts becomes a possibility. Hence it becomes necessary to secure (1) the prevention of over-crowding and competition, and (2) the supervision of apprenticeship. It is out of these needs that the guild arises.

19. The development of industry, the advent of commission work, and later the development of the factory make guild supervision and control inadequate. The outside competitor despises its rules. Having lost its authority as a regulator of trade, it loses its power also in the control of apprentices. Apprenticeship does not perish altogether. On the contrary, it continues to this day, but in an altered form. There are learners in most factories, but the learning period is usually, in view of the minute sub-division of processes, short. There are some who pass from one department to another as "learners" partly with a view to finding out what work suits them best, partly so as to have several accomplishments to fall back upon in event of unemployment.

20. The value of apprenticeship for the training of craftsmen in India has been repeatedly urged. The question was discussed by the Committee on Industrial Schools of 1903. The general trend of opinion is against it.

21. Apprenticeship is a contract for service on the part of the pupil and for instruction on the part of the master. The master stands in the place of the parent. The carrying out of the contract is supervised by the local community. Thus there are three parties in the matter: (1) the apprentice, (2) the master, and (3) the local community. Advocates of apprenticeship seem to be of a somewhat idealistic turn of mind. They urge the undoubted advantages of the system, *viz.* :—

- (1) the boy learns under real trade conditions: his instruction therefore is likely to be practical;
- (2) he receives individual attention and instruction; and
- (3) he is not merely taught skill, but also character: his life is regulated by the master.

22. Educationally all this is splendid, for character is everything in education. Artistically it is good, for in those trades which contain an element of art personal touch is all important. Here lies the cause of the frequent failure of the Art School. It is not so much the master's skill, but his outlook, his devotion, his attitude to the world and to his art which effects the pupil's development. Do artists come from the South Kensington School of Art?

23. The difficulty is that all the advantage are the advantages of one party only—the apprentice, and of the apprentice only for a part of the time. If apprenticeship is to succeed it must pay the boy; he must receive instruction which has a definite market value. It must also pay the master. He must receive service which is of some value to him. Hence arose the need of indenture. For the general tendency is for the boy to stay with the master just so long as he is learning and his services are practically valueless and no longer. As soon as his services become of any value, the boy goes off to another craftsman who offers him a bigger price. The master naturally expects to recoup himself during the concluding years of the indenture during which he is paying low wages for good work for the period during which the boy's services were totally useless. It is only just then that the better the master's teaching, the greater his reward should be during the final years of service. It naturally requires all the powers of the Guild to prevent the enticing away of apprentices; "Enticing" is scarcely the word, for the apprentice does not require any alluring to leave his apprenticeship if he can go and earn more elsewhere. Messrs. Labchand Motichand of Bow Bazar, Calcutta, have a most interesting school for apprentices in jewellery. They state that no boy yet during the ten odd years' existence of the school has stayed the full period. Very few stay more than 2 or 3 years at most.

24. Obviously, however, unless the master's rights are maintained the system of apprenticeship must disappear. It may be added, though the apprentice does not realise it at the time, that it is the final part of his instruction which is the most important. In that final period he learns to maintain a standard of quality—that excess of skill and delight in its exhibition, which distinguishes the artist from the mere worker. The last years of apprenticeship are in fact a training in character; but in spite of the laudable endeavours of various moral instruction leagues very few boys are able to realise or appreciate character training—at least not till afterwards. I do not think that we ought to complain about this. There are quite enough prigs in the world already.

25. The excellence of apprenticeship as a means of education must be admitted. Probably there is no method of specific education which is so good. Its practicability is at least doubtful. It does not pay the master because there is no power to enforce the fulfilment of the indenture. Moreover, under modern conditions large factories prey like parasites on the small ones and it is of course the small works, which give the best all round training. Apprenticeship does not pay the apprentice because apprenticeship is not enforced as the one

and only entrance to the craft. Without apprenticeship, or with a much shorter and less effective period learning, he can earn far more quickly and just as much.

26. The control of apprenticeship by Trades Unions in England is worth a moment's consideration. The unions have consistently opposed instruction in technical or artisan schools. This opposition has been based on fear of over-recruitment. They have favoured correspondence evening and continuation teaching, because it is given to men who are already members of the craft. Could they have a monopoly of the earlier teaching, they would undoubtedly be enthusiastic in giving the instruction, probably far more enthusiastic and far more capable than any present agency, because it would pay them. Under such conditions apprenticeship might well be revived.

27. In India there are no Trade Unions. There are a few Guilds, but they are not powerful. Caste is powerful, but it is not an industrial unit either in origin or in present function. It might become so. But it seems more probable that industrial development will be accompanied by a weakening rather than by a strengthening of caste. Had caste been adopted as an educational unit in the first instance, the result might have been different. It is in many ways a most valuable social organisation of which much use might have been made. A democratic outlook on sociology has emphasised its worst features. Probably the opportunity has passed and possibly the institution is so far removed from British ideas, perhaps so contrary to human nature itself, that there never was a possibility of a constructive policy with regard to it. Certainly caste as an active monopolist of labour and of a certain form of specific education seems quite incredible.

28. In the last resort we have to ask ourselves what does apprenticeship teach: School education produces uniformity of character; apprenticeship produces difference. That very uniformity of demand and supply in production which puts an end to the small industry, puts an end also to the training system of the small industry, in spite of all its merits. Modern industry requires inter-changeable parts, in its machinery and in its employes. It requires a standardised equipment in a worker even if that equipment be inferior. A special knowledge of one workshop is not so valuable as a general adaptability. In a word, apprenticeship, in its true meaning, training by personal influence and imitation, will not suit the large industry, and the future of the small industry is at least doubtful. As the method of teaching art, where difference and personality are the essentials, it lives still and it is never likely to perish.

29. The artisan school of Bengal is a growth arising out of the policy of 1854, the policy of providing practical instruction for the masses in their own employments; as a rule carpentry, tin-smithy, sometimes black-smithy and brass work, and more rarely basket work, are taught. Some artisan schools contain a section preparing candidates for work on zamindars' estates. The men turned out of this department are a sort of low grade surveyors. I have said above that some artisan schools contain a department of this kind. It would be more correct to say that schools which originally taught a certain sort of low grade of surveying and were subsequently developed to teach a part of the course of the Apprentice Department of the Sibpur College took up also at a certain stage in their development the training of artisans. The artisans are as a rule more or less illiterate and instruction in the three R.'s is given or supposed to be given in addition to the training in the workshops. Most of these artisan schools are not very successful. Artisans won't come at all except at very liberal rate of scholarships, and even with these they practically never remain throughout the whole course. The survey departments which provide for a low grade of professional employment for those who have been sifted early out of the selective system—the qualification for admission is the Middle English or the Middle Vernacular Examination—are exceedingly popular. In fact if you close these so called survey departments the system of Government and District Board technical schools, on the development of which the late Government of Eastern Bengal and Assam laid such store, would collapse.

30. I do not think that it is fair to blame the schools themselves. Their training of artisans is, on the whole, I think, practical and in close touch with the market. Sometimes the touch is perhaps too close, and their work is little better than that of the bazar. It is always more expensive. It would be too much to expect that they should lead the market, producing new designs and processes; yet something might be done in this way, if the schools were in the hands of really effective headmasters.

31. What is the reason for the failure of these artisan schools. The cause seems to be entangled in the perpetual discussion, which rages round technical instruction, at any rate in India. Are these schools preparing boys for present or for future industries?

32. If the training is for future industries if it is hoped that these boys will go out and create or develop new industries, are we not putting rather a heavy strain on youthful or parental optimism? A parent might send his boy to school in the hope that he will attain to a certain already existing position in an existing business. I have never met any one not even a Yankee, who entertained any definite hopes that his son would create a business and his post therein. Are we so certain ourselves that the industry will come? Even assuming the ability in the child, where is the capital? The ordinary Bengalee parent prefers to invest it in some less risky venture on behalf of his child. The obvious educational speculation is a comparatively inexpensive high school education with its lure of a Government appointment. At least in most cases the artisan school training given is intended to prepare the boy for

industry in its present condition. Here again the school is placed in a dilemma. It may endeavour to give a training severely practical, based simply on the existing processes, or it may endeavour to give a wider training in theory and practice, which will make the boy something more than the ordinary mechanical labourer. If the school gives the mere mechanical training, it is difficult to see what advantage it has over uncontrolled apprenticeship, which is the method usually employed. For if the school is practical, it must take notice of the existing conditions and processes. If this is so, is it practical to teach the use of a power-driven lathe for brass work? The child when he leaves school could not afford to purchase one, nor is his business likely to be large enough to bring him a return on such an outlay, were he in a position to afford it. Hence the school must teach merely what is done at present, and the boy's father, or his uncle, or his father's friend is probably a far more effective teacher. He is likely to be more practical: he is in closer touch with the market; he can give the boy more individual attention. If on the other hand the school attempts to give a wider training, a training far more thorough than that which the ordinary artisan master could give, its difficulty then is the narrowness of the demand. The boy desires merely to learn the specialised craft and wants to earn, as soon as he possibly can. If the school takes three years to teach him, even if it teaches for nothing, even pays a scholarship, the boy would prefer to learn rapidly the few special processes from a worker and start earning. No scholarship can compensate the boy or his parents for the loss of two years' wages. The educational superiority of the school course is a matter entirely beyond the parents' comprehension.

33. Probably the parents are right, for if wider intelligence and skill were among the conditions of the artisan's livelihood, the artisan would possess them and be able to impart them. The wider training is an attempt to produce a worker better than the circumstances demand in the hopes that he will raise his trade. It is a form of education for future needs; and this as I have pointed out is a form of education which can never appeal to the public. Socially it is an excellent scheme. Where compulsion is exercised as in German Compulsory Continuation Schools it may be successful. It can never succeed as a voluntary system.

34. The same criticisms apply to the technical school. Where the school trains for an existing form of industry, pupils may be obtained. But here the school works under a disadvantage in that most industries can give all the training they need in their own shops, and the training there given is better adapted to their own special conditions of work. The state technical school or college competing with the workshops of the larger industries as a training ground of the workers for those industries seems to me to be a monstrous anomaly.

35. Certain large employers notably railways are beginning to find that the technical training which they are able to give to their apprentices in their workshops require supplementing by some more effective and thorough form of general instruction than they are at present able to provide. They are beginning to feel that it would be an advantage to have efficient schools for general supplementary instruction attached to their workshops. I am not at all sure whether this will not be found to be one of the most effective ways in which Government can contribute to the production of efficient workers. The Governing Body of the Civil Engineering College are now considering whether it would not be possible to arrange for a much closer co-operation between the Apprentice Department of that college and the large employers of labour especially the railways.

36. A great deal has been written on the question whether technical and industrial schools should be under the Education Department or the Department of Industries, where one exists. On general principles I am in favour of a strong Department of Education which should develop in co-ordination all the various aspects of the educational system. I have always advocated this and opposed any transfer of technical colleges or schools from the Education Department. I am now, however, beginning to see that in administration generally, education is after all one of the aspects of administration, we have in India certain machinery which has somehow grown up and cannot be scrapped or even very seriously modified. The question therefore of the relative spheres of activity of the Departments of Education and Industries is one which I should decide on local considerations of practical convenience rather than on general principles. While I know that the Director of Industries, if he is to effect anything, will have to proceed by means which are in no sense educational and while I think that it would be unwise to impose upon him to start with any responsibility in connexion with existing technical or industrial schools: I do not consider it would be either logical or wise to deprive him of all influence over these institutions. If these institutions do not bear on the development of industry what is the use of them? If they do, surely the Director of Industries ought to have some say. There are now so-called schools with very little which is scholastic about them. If under the influence of the Director of Industries these institutions can be made to serve a more useful purpose by being converted into something which is in no real sense a school at all, so much the better. It makes very little difference what they are called. I am doubtful whether general uniformity of treatment is either possible or desirable. If the Director of Industries found that he could take an industrial school and make any practical use of it in any scheme which he had in hand in developing local industries, then I would say let him take that school over. Let things be as they are until an Industrial Department has not only been started but has been working for some two or three years. It is idle to discuss details of machinery, when we are still absolutely vague as to what it is practicable for us to attempt.

The relation between the Departments of Education and Industries.

Note on apprentice schools in engineering works and their relation to other forms of technical education.

[N.B.—This note has been compiled on the basis of information received from the Board of Education, Whitehall, London, S.-W.]

1. Within the last few years the movement for training the artisan for the work he is employed upon has found almost simultaneous expression in various parts of the world. The United States of America, Japan, France, Germany, and Great Britain have occupied themselves with this problem; and although the methods adopted by these countries differ very considerably one from the other, yet the idea expressed in the works school is common to nearly all of them.

2. *Developments in Foreign Countries.—Germany*—In the larger industrial centres in Northern Germany it is usual for an apprentice school to be provided in each works, or for a single school to be established in a central position to serve several works of a given kind. Such schools are recognized by the State, and students attached to them are exempt from attendance at the compulsory continuation school.

3. *France*—In France there is no national scheme for training artisans, but an association has recently been formed for the study of industrial arrangements and of various methods of training with a view to planning a national scheme for the training of apprentices.

4. *The United States of America*—In the United States there is as yet no national scheme for vocational training, but a strong movement in this direction has been manifested in many localities. Co-operative or half-time schools have been developed, in which the boys work in pairs and alternate week by week between school and workshop, one of the pairs being at school while the other is at work. Apprentice schools have been established in many of the large engineering works. Such works include the Pennsylvania and other large Railway Companies; the Westinghouse Electric and Machine Companies; the General Electric Company, Yale and Towns; Brown and Sharpe, Packard, Cadillac, and other large Motor Companies; the American Locomotive Company, and many others.

5. *England*—Apprentice schools have been established in England in connection with the following works: the Royal Dockyard (four schools); the Gas Light and Coke Company, Westminster; R. W. Paul's Instrument Works, New Southgate; the British Westinghouse Company, Manchester; the Midland and Great Northern Railway Works, Melton Constable; the Post Office Engineering Department, London; Head Wrightson & Co., Thornaby, Yorkshire; the South-West Railway Works, Eastleigh. Most of these schools aim at giving a training in the scientific principles of engineering to selected apprentices, rather than at training the rank and file for their daily work. The schools of the British Westinghouse Company, R. W. Paul, and the Post Office aim at training the ordinary artisan for his work.

6. *The educational needs of the ordinary artisan*—The Educational needs of the ordinary artisan may be summarized as follows:—

- (a) Instruction in workshop methods and procedure.
- (b) Instruction in the use of tools.
- (c) Instruction in elementary science, drawing, and calculations bearing directly upon the trades concerned.
- (d) Instruction in non-vocational subjects of a scientific, technical, or literary character to afford an interest in life outside the work of the artisan.
- (e) Instruction in the rights and duties of citizenship.
- (f) Some form of selection whereby students who show exceptional ability in the trade training may be afforded further training of a higher character.

7. *The existing means in England for training artisans*—At the present time an attempt is being made in England to meet some of the needs referred to above by means of the following agencies:—

- (1) Junior technical schools.
- (2) Part-time day apprentice courses.
- (3) Minor evening courses in senior institutes.
- (4) Trade courses in evening continuation schools.
- (5) The workers' educational association classes.

8. *The magnitude of the problem in England*—The census return for 1911 showed that the total number of males engaged in engineering work was approximately 828,000. This total was made up as follows:—

General engineering and machine-making	416,000
Tool-making	50,000
Electrical apparatus	84,000
Ship and boat-building	104,000
Vehicle-building	174,000
Total	828,000

The proportion per 1,000 of all occupied males in England and Wales for the age-range 15 to 20 years during the period under consideration was 133, or 13·3 per cent. On this basis it was estimated that the total number of workers in the engineering industry of 15 to 20 years of age amounted in 1911 to about 110,000. It was assumed by the Board of Education that all these youths ought to receive some sort of training for their work, but it was considered probable that a large number of them would be engaged upon work of a more or less unskilled character. The Board ascertained that in the British Westinghouse Company's Works the apprentices who were attending the works school in 1911 formed 7 per cent. of the total number of persons employed. They applied this percentage to the total number of male workers then employed in the engineering industry, and calculated that about 58,600 would require training for skilled work. The Board took this number as being evenly distributed over the age-range 15 to 20 years, and found that about 11,600 youths were entering the industry each year, and assumed that a training was required for this number as a preparation for their skilled employment.

9. *Junior technical schools.*—The Board of Education went on to discuss the agencies then existing in England for the training of artisans (see paragraph 7 above). They observed that the proper function of the junior technical school (engineering) appeared to be to give a pre-apprenticeship training to boys who would ultimately become charge hands, foremen, or shop engineers. They remarked that it was most desirable that boys sent to these schools with scholarships should be selected with care and with a view to their future careers. The Board added that in the London elementary schools the best boys were selected for transfer to secondary schools, the next best for transfer to central schools, while the junior technical schools were recruited from the residue. The Board stated that some adjustment appeared to be desirable between the aims of the junior technical schools and the central schools, and that the most effective arrangement would seem to be that the central school should aim at pre-apprenticeship training for boys who would ultimately become skilled artisans, and that the junior technical schools should train selected boys who would ultimately fill the more important artisan positions, such as foremen, etc.

10. *The functions of part-time day courses in technical schools.*—The functions of part-time day courses were stated as follows :—

- (a) To give a supplementary training to youths who have shown marked ability in works schools or evening courses with a view to training them for leading artisan positions and to selecting those of marked ability for further training in full-time day courses.
- (b) (In towns with a considerable number of small works of a given kind.) To work in conjunction with a "central training workshop," and to train the rank and file on the same lines as in an apprentice school in a large works. To select youths of marked ability for further training under (a) above.

11. *The functions of evening courses for artisan students.*—The functions of evening courses for artisan students were reported to be—

- (a) The provision of minor courses giving a trade training, and the selection of the best students for part-time day training.
- (b) In certain cases to provide instruction in science, drawing, and mathematics supplementary to the instruction given in an apprentice school in a works.
- (c) The provision of courses in non-vocational subjects. The question as to whether trade instruction should be given in junior courses is one that calls for serious consideration, and cannot be dealt with adequately in this note.

12. *The position of apprentice schools in works.*—Although the problem of training the rank and file of the industrial army has been attacked in England it has not yet been adequately treated, and a full solution has yet to be found. The Board of Education recognized the importance of the matter, and in a memorandum on the teaching of engineering in evening schools they described a number of minor courses for various trades which might provide a partial solution to the problem. These minor courses, however, have as yet not been extensively adopted, and no clear line of demarcation has been drawn between the work of the major and the minor evening courses. The present English system of technical education in evening schools appears to have developed from the top downwards, and an academic atmosphere still clings to the instruction given to artisans, making it remote from the daily work of the shops. It is essential that this academic atmosphere should be removed, and that it should be replaced by a "works" atmosphere. The reason for the institution of apprentice schools in works is to be found in the growing conviction amongst employers that under modern conditions of work in the shops it is not possible for the foremen to impart to apprentices as much theoretical and practical instruction as they require in order to carry out their work properly and in the most efficient manner. Coupled with this fact, the employers have recognized that the scheme of technical instruction has called for voluntary attendance on the part of artisans, and has offered to them a training that will fit them to rise to higher positions; but it has not given to the rank and file a training which will fit

them for their everyday work. The works school appears to meet this need in a very efficient manner.

13. *Advantages of works schools.*—The apprentice school in works appears to possess the following advantages:—

- (1) The question of compulsory attendance is dealt with by the employer in his indenture with the apprentice. Compulsion applied in this way is less likely to be resented than when applied directly by the State.
- (2) The employer is responsible for the trade instruction, and can assure its being carried out on lines to suit his requirements.
- (3) The instruction is given under conditions which cause the least disturbance to the work of the shops, and it is given at times best suited to the employer. On the other hand it must be recognized that works schools can only be established with advantage in fairly large works, and that small works must be dealt with by the establishment of "central training workshops" and by part-time day and evening classes. It may be urged that the instruction in science and calculations given in works school might be better undertaken in a technical school, but in a large works the instruction in these subjects of a character suited to the ordinary artisan could quite well be given by young engineers on the works staff.

Memorandum on some classes for railway apprentices in England.

[N.B.—This memorandum has been compiled on the basis of information received from the Board of Education, Whitehall, London, S.W.]

1. *Great Eastern Railway, Stratford, with repairing works at Ipswich, Norwich and Peterborough.*—There is a scheme in connection with these works by which certain apprentices obtain certain advantages. An apprentice must have been in the works for three years and have attended work regularly and given satisfaction; he must have attended classes at the company's mechanics' institute at Stratford, and be able to produce certificates that he has worked there satisfactorily. He has to pass a local examination embracing certain of the Board of Education and City and Guilds subjects. When he has fulfilled these conditions he may submit to the head of his department in the works a course of full-time study which he proposes to follow for a period of six months. Should this be satisfactory to the company he will be allowed to absent himself from the works for six months with full pay. The institute at Stratford, which is the property of the railway company, is not assisted by the Local Education Authority, but receives a grant from the Board of Education, and the company take a considerable interest in the work of the institute and provide for its maintenance. In connection with the classes held at the institute the company have practical classes at the works, in which students have the opportunity of using testing machines and of taking indicator diagrams from steam engines, etc. These classes are not recognized by the Board of Education for the purposes of grant. Special prizes are given by the company to a considerable extent. The approximate number of premium apprentices is 40, non-premium apprentices 460, and workmen 5,000. About 350 of the apprentices attend evening classes. Encouragement is given to apprentices to attend classes, in that promotion is made only to those who have shown ability in the evening classes as well as in the works.

2. *Great Northern Railway Company, Doncaster.*—The work done comprises locomotive, carriage, and wagon building. There is no definite scheme of education. The Great Northern Railway pay the fees of apprentices who attend evening classes and part of the fees of apprentices who attend afternoon classes at the technical school; they also give annual prizes to their students to the value of about £20 a year. The Chief Locomotive Superintendent is a co-opted member of the Higher Education Sub-Committee of the Doncaster Local Education Authority. There are 40 premium apprentices and 700 non-premium apprentices in the works. About 4,000 men are employed. Of the apprentices, about 25 premium apprentices and 110 non-premium apprentices attend technical classes. It is usually found that the premium apprentices attend the day classes and the non-premium apprentices the evening classes. No special privileges in the way of "time off" are allowed to apprentices attending evening classes. Periodical reports are sent to the company with regard to both day and evening students.

3. *Great Western Railway Company, Swindon.*—Locomotive building and carriage and wagon building are carried on here. There is a definite educational scheme approved by the company. The preliminary year of technical training is given in courses held in five evening schools built and equipped by the Borough Council and aided by the Local Education Authority. The technical school is managed by the governing body, which includes representatives of the company.

According to the company's regulations, all apprentices are expected to acquire a knowledge of practical mathematics, practical mechanics, geometrical and machine drawing, heat, electricity and chemistry. Those who have not had previous scientific training are expected to attend

the preparatory classes which are provided for students from 14 to 16 years of age. Subsequently they are expected to attend the engineering course which is provided for those between 16 and 21 years of age. Each apprentice is required to keep systematic notes of his studies. He is also required to make a record of his observations in the workshops, accompanied by neat sketches.

In order to encourage good work in the evening classes, it has been decided that when apprentices attend the engineering classes regularly three evenings a week and give evidence of industry and perseverance, their absence from the factory before 9 o'clock on the three mornings immediately before or immediately after the classes will not be recorded against them. The Great Western Railway Company also offer a number of day studentships to be competed for by apprentices between 17 and 18 years of age. Candidates for these must have regularly attended, for at least one session, the evening grouped courses in engineering at the technical school, and must have been at least 6 months in the factory. The successful students will attend two half-days a week for 26 weeks at the technical school. They will have their wages paid as if they were in the factory, and the railway company will pay their school fees. Capable students will continue for a three-year course, and those who distinguish themselves will be allowed to spend part of their last year in the drawing office or the chemical laboratory. The number of free studentships to these day courses will be limited to 30 at any one time, generally in groups as follows for a three-year course; first-year course 15 students; second-year course 9 students; third-year course 6 students. For each year's course there will be a competitive examination, successful students passing from one year's course to the next.

A monthly report is furnished by the principal of the technical school to the company on the work of premium apprentices and weekly report is furnished on those attending day classes and on those who claim the privilege of early morning leave.

4. *Midland Railway Company, Derby.*—Locomotive building and carriage and wagon building are done here. There are three types of apprentices: privileged apprentices, pupils, and ordinary apprentices. With regard to privileged apprentices, during the period of apprenticeship each apprentice is required to attend the classes held at the Derby technical school during two mornings a week, or any other course which may be determined from time to time. On these days he will not start work in the shops until 2 P.M. Each year of service he will be expected to sit for any examinations in technical subjects which may be held for the employés in the Chief Mechanical Engineers' Department. With regard to pupils, the conditions are similar to those of privileged apprentices, except that each pupil is required to pass the students' examination of the Institution of Civil Engineers before the end of his third year in the works. Persuasion and advice are given to induce ordinary apprentices to attend the evening classes, but there is no compulsion with regard to these apprentices. An examination is held in Derby every year, open to any apprentice who has been attending evening classes. Superior posts are given to those students who show merit in this examination. There is an institute conducted by the company which is not aided by the Local Education Authority. The only subjects taught in the institute are French, shorthand and German. The privileged apprentices and pupils attend the classes at the technical college. The company does not aid the technical college, nor is it represented on the governing body. The privileged apprentices and pupils number about 40. The ordinary apprentices number about 535. The workmen, excluding apprentices, number about 4,000. Any apprentice who attends evening classes and asks on that account to be excused overtime is so excused. Reports are sent to the company with regard to the progress of its apprentices in the day and evening classes.

5. *Midland and Great Northern Joint Railway, Melton Constable.*—No definite educational scheme exists, but all non-premium apprentices under the age of 18 must attend, in the company's time, a class in workshop mathematics of 1½ hours a week for 39 weeks in the year. The company allows the use of a good institute heated and lighted practically free for evening classes. The company provides a teacher free of expense for the afternoon class mentioned above. The parents of apprentices are required to sign a form stating that their boys will attend two evening classes each winter. Promising students are given chances of improvements by being taken into the office. The company officials make liberal offers of prizes. The committee consists of certain of the company's employés, and receives a grant from the Local Education Authority. There are 8 premium apprentices, 100 non-premium apprentices, and 500 workmen.

6. *North-Eastern Railway Company, York.*—Carriage and wagon building and some repair work are carried on. There is no definite scheme approved by the company for the technical training of their apprentices, although it is understood that notices will be issued that in future apprentices will be required, on admission to the works at the age of 16, to give evidence that they have some acquaintance with machine drawing, applied mechanics, and mathematics. Classes are held at the North-Eastern Railway Institute, a building provided by the company. The institute serves as a technical school for York so far as engineering is concerned. The Local Education Authority subsidize it to the extent of £250 a year. There are 4 premium apprentices, 136 non-premium apprentices and about 2,000 workmen employed by the railway in the works. Apprentices who attend evening classes are allowed to leave work early, but only by special permission, and only two apprentices have obtained this permission. The company has given some apparatus to the technical school.

Note on some part-time apprentice courses which are conducted in England for engineers.

[N.B.—This note has been compiled on the basis of information received from the Board of Education, Whitehall, London, S.W.]

I.—THE ROYAL DOCKYARD SCHEME.

1. The apprentices are employed in the building and fitting of ships for the Navy. They include shipwrights, engineering fitters, ship fitters, electrical fitters, boiler makers, caulkers, copper-smiths, founders, joiners, painters, pattern makers, plumbers, rope makers, sail makers, smiths, etc.

2. The dockyards are at Chatham, Sheerness, Devonport, Plymouth, Portsmouth, Pembroke and Haulbowline.

3. The apprentices are selected when between the ages of 14 and 16 years by means of a severely competitive annual examination; hence if a boy takes the examination at 14 and fails, he has another opportunity of sitting for the examination at 15 years of age. The period of apprenticeship was formerly seven but is now six years. The annual entry of apprenticeship is adjusted roughly to the annual loss through death, promotion, superannuation or other causes, and hence it rarely happens that an apprentice is discharged on the completion of an apprenticeship. The competition for these places is very keen. There are about 40 candidates to each vacancy. The better apprentices are promoted to such positions as draughtsmen, recorders, inspectors, etc. By means of Admiralty scholarships the best are able to proceed to the Royal Naval College at Greenwich for a further training with a prospect of securing appointments in the Constructive and Engineering Branches at the Admiralty. The dockyard schools were founded in 1843 at a time when there was little, if any, provision for technical education in dockyard towns. Their objects were not only to create a body of educated men from which could be recruited the designers and builders of ships for the Royal Navy, but also to increase the efficiency of the workmen as a whole. Many examples could be quoted of apprentices who ultimately have filled such positions as Director of Naval Construction and Assistant Directors and Engineers at the Admiralty; while many have passed into the service of private engineering and ship-building firms, and have become eminent designers or have occupied other positions of responsibility. At the present time, when compulsory attendance at continuation schools and the more general adoption of the part-time day system are being advocated, it is interesting to observe that the best example of this system which can be furnished is one which was initiated by a Government Department 70 years ago. The success of the system has been so remarkable, that it is surprising that it has not been adopted by a larger number of engineering firms. Attendance during the day-time while the apprentices are fresh, the disciplinary effect of compulsory attendance, together with the chances of promotion offered have produced remarkable results. The progress of the students through the schools is as follows.

4. Of the successful candidates at the entrance examinations the better section proceed to what is called the upper school, which they attend for 12 hours a week, made up of 3 hours on each of two afternoons and 2 hours on each of three evenings in such a way that they attend only on three different days in the week. The weaker section attend the lower school for 7 hours a week, made up of 3 hours on one afternoon and 2 hours on each of two evenings. The course in the upper school extends over 4 years, and that in the lower school over 3 years; in each case for 40 weeks in the year. Annual examinations are held in both schools, external examiners being employed in the case of the upper school. In the case of the lower school examinations the papers are set and marked by the staff. On the results of these examinations apprentices in both schools are weeded out rigorously from each year of the course, those remaining behind being promoted. Those who are rejected remain in the dockyard, but for further theoretical training they have to rely upon the technical school, which is maintained by the Local Education Authority.

II.—WOOLWICH ARSENAL TRADE LADS' SCHEME.

5. The following regulations govern the entry and training of trade lads at the Royal Ordnance Factories at Woolwich:—

(i) *Entry—*

- (a) An entrance examination is held annually in June.
- (b) The age of a candidate must not be less than 14 nor more than 16 years on 1st January preceding the examination.
- (c) Intending candidates must apply in their own handwriting between the 1st April and the fourth Saturday in May on a form which will be supplied on application to the Chief Superintendent, Ordnance Factories.
- (d) The vacancies are filled by candidates in the order of merit shown by the examination, provided that in each case not less than half the maximum number of marks has been secured in each subject.
- (e) Qualified candidates before entry into the workshops must be passed as fit by the Ordnance Factories Medical Officer.

- (f) The candidates are, in order of merit and subject to the convenience of the Ordnance Factory, allowed to choose the trade and department in which they will be trained.
- (ii) *Subjects of entrance examination—*
- Elementary mathematics.
 - Elementary physical measurements and their applications.
 - English.
 - Drawing.
- (iii) *Work in factories—*
- Trade lads are subject to the Ordnance Factories rules and regulations.
 - Each trade lad is attached to a competent workman, who instructs him in the use of his tools during the first three years in the workshops.
 - A lad showing an exceptionally good record of progress in the course of compulsory study detailed below receives, at the convenience of the department, a preference in being moved to different workshops while learning his trade and in receiving facilities in the drawing office.
 - Trade lads are not required to work overtime or nightshift during their training.
- (iv) *Work at the Woolwich Polytechnic—*
- During the first four years of their training all trade lads are required to attend the classes at the Woolwich Polytechnic detailed below.
 - If a lad does not attend these classes regularly, or if an unsatisfactory report is received of his progress, he is dismissed unless exceptional circumstances can be shown to exist.
 - Trade lads have leave with pay one afternoon per week during the first three years of their training to attend classes at the Polytechnic on one afternoon per week. During this period they also attend classes on three evenings per week for 40 weeks in the year. In the fourth year the lads attend for three evenings per week only.
 - The school fee is refunded to each lad at the end of his year's course if a satisfactory report of his attendance and progress has been received. The fee for the fourth year is payable by the lads and is not refunded.

III.—THE GAS, LIGHT, AND COKE COMPANY'S SCHEME.

6. The scheme was established in 1908 by the Gas, Light, and Coke Company in co-operation with the London County Council for the training of their gas fitters and apprentices. The theoretical work is done in part-time day classes and in evening classes held by the London County Council Technical Institute, Westminster. The practical training is carried out on the Gas Company's premises in special workshops which have been equipped for this purpose. The whole course extends over a period of six years.

(i) *Students.*—Applications are invited by the London County Council from pupils attending elementary schools in the district, and direct applications are made also to the Gas Company by sons or relatives of their employés. There are at present about 100 lads in training, and the Gas Company pays them from 2s. 6d. per week in the first year to 22s. 6d. a week in the final year of their apprenticeship.

(ii) *Theoretical work.*—Instruction is given in technical calculations, engineering drawing, English, elementary physics, and gas supply. The theoretical instruction averages 5½ hours per week throughout the course.

(iii) *Practical work.*—Practical training comprises 12 months in the special training workshops for 36 hours per week; 18 months on gas work in the district as assistants to fitters; 12 months as fitters' mates; 6 months meter testing; 6 months mantle maintenance department; 6 months mantle department; 6 months fitters; 6 months in show-rooms; 3 months in office; and 3 months estimating.

(iv) *Subsequent employment.*—At the end of their training the lads are continued in the company's employ, either as skilled artisans or as staff representatives.

IV.—THE MANCHESTER SCHEME.

7. Arrangements have been made between the School of Technology, Manchester, and about 40 engineering firms in the district whereby selected apprentices attend at the school for one day a week from 9 A.M. to 5-30 P.M. for 40 weeks per annum. The complete course extends over two years.

8. There is a strict entrance examination, and at the present time about one-third of the candidates are rejected.

(i) *Curriculum.*—First year: mathematics, mechanics, physics, and engineering drawing. Second year: mathematics, mechanics, heat engines, and engineering drawing.

(ii) *Reports and Certificates.*—Monthly reports are furnished to the employers of the attendance and progress of the students. Internal examinations are held in all subjects at

the end of each session and certificates are awarded to those students who have attended for two sessions and have passed the examinations in all the subjects of the course at the end of each session.

ORAL EVIDENCE, 7TH DECEMBER 1916.

President.—Q. You say speaking of apprentices "As soon as his services become of any value, the boy goes off to another craftsman who offers him a bigger price." We have heard the same complaint from firms when we asked them what they were doing to train their young men. When one takes that statement into account with the fact that in this country you can never get an apprentice to pay a premium but on the other hand he has to be paid from the beginning, does not that indicate that there are far too few expert workers for the work to be done and consequently is there not room of a very definite kind for the development of elementary and industrial schools?—A. I think so.

Q. With regard to our schools and colleges you have great difficulties in getting them filled except by bribes in the form of scholarships. Is it likely that a boy will value his education and his training unless he pays for it?—A. You mean technical schools?

Q. Yes?—A. The evil of the scholarship system is that it very often tempts a boy who has no sort of capacity in a mechanical direction into a technical school. The B classes have failed in Bengal. Speaking generally the type of boy who was and is attracted to these classes is the boy who cannot pass the Matriculation Examination.

Q. The apprenticeship system at home by which a boy is bound for five years has generally worked without any difficulty. Is that largely due to the fact that the boy has paid for it and stays for five years to get value for his money?—A. Yes, I think so.

Q. The remark made by Messrs. Labchand Motichand is very similar to the remark made to me by a member of the Commercial Institute here. I do not see how you are going to meet this difficulty?—A. I do not quite see how it is to be met. The position in Bengal seems to be this. Every boy of any social position or ambition wants to obtain a University degree. This is also the goal of all his parents' hopes. Every sacrifice will be made both by the boy and his parents when University examinations are the objective. A boy does not ordinarily go to a technical or commercial institution, unless and until he has definitely fallen out of the course which leads to a University degree. He is then a failure, flotsam which tends to drift.

Q. What is the value of the University degree?—A. It is the one gate to Government employment and to the favoured professions. If a young man can secure both a M. A. or M. Sc. and a B. L. degree he has 2 sets of openings before him. The Commission do not perhaps realise the enormous differences which it makes to a man's career in Bengal whether he has had to stop at the B. A. stage or has been able to secure the M. A. degree. I am compelled to offer B. A.s who are foolish enough to enter the Education Department as teachers Rs. 35 a month in the Lower Subordinate Educational Service, while an M. A. if he is fortunate enough to get into a college may begin on Rs. 200 a month in the Provincial Educational Service.

Q. One cannot say that Government is doing wrong by offering these attractions?—A. Possibly not, though the effect of making your educational system your direct sifting machinery for office and professional employment is overwhelming and I think disastrous. The position would not be so difficult in Bengal if the standards of the various educational grades were reasonably high. If it were made more difficult to get a degree, fewer would enter for them and those who secured them would represent a more uniform level of efficiency. Similarly as regards secondary schools, if there was a reasonable standard of admission to the secondary stage of education, fewer incapables would enter it and the general effect of secondary education on the community would be far more beneficial.

Q. The standard of examination here is fairly comparable with the examinations in England—I don't say of the Matriculation but of the degree examinations?—A. I cannot express any positive opinion because I have not been an examiner for the Calcutta University for many years. When I did examine for the B. A. and Intermediate Examinations my impression was that a great many unfit people went in for the examination and that many such passed. If you study the results, you find that there are a very large number of people who just get the pass marks and a few more. I do not think that this is the case in England in degree examination. Any examination finally adapts itself to the level of the candidates who go up for it.

Q. One thing that I have, as an examiner of the Calcutta University, felt is that there is a sort of uncomfortable feeling that you have to give the men marks for the answers they have given but you feel all the time that they are not fit for the University. I have found it difficult to analyse the feeling of discomfort. Have you felt that as an examiner?—A. Very strongly! In a subject like English literature, one felt that the whole thing was an elaborate and tedious joke—that a large number of hardworking and estimable young men had been compelled by some sinister but utterly stupid tyranny to waste the most precious years of their life in studying something which was utterly meaningless to them, while at the same time it was admirably calculated to make it almost impossible for them to get what they did want, namely a working knowledge of the English language.

Q. Do you think that matters would mend to some extent if we had a more extended system of primary education followed by simple industrial education?—A. I think that is probably in Bengal a necessary ingredient in the solution of the general problem.

Q. But at present the masters who are in charge of these primary schools are paid on a scale that surely does not attract the best type?—A. A man starts a school (the mere fact of his having done so entitles him to masquerade under the once respected title of *pandit*); he runs it for a certain time and the District Board gives him perhaps 2 or 3 rupees. Then perhaps the *pandit* goes away or gives up teaching and the primary school ceases and there is probably nothing to put in its place. What is known as the District Board Primary School system was started in East Bengal. Under this system the District Boards provide a certain number of school houses in which specially selected *pandits* hold their classes. Each such *pandit* gets a special allowance from the District Board. Fees are also levied and divided among the *pandits* of the school. The advantage of the system is it gives certain of the better primary school *pandits* a fixed and suitable *habitat* and reasonable emoluments.

Q. In Bombay I saw a scheme that was carried out in the Victoria Jubilee Technical Institute. They have a system of marking which begins when the boy enters and lasts throughout the whole of the four years' training. He gets marks for the quantity of work done as well as quality and he is allowed to work within certain hours. That means that the boy has to be prompt in everything that he undertakes. That must come into the boy's character after four years' practice and is exactly the kind of practice that distinguishes a business man from men of many other classes. If your results are based entirely on examination work I do not see how you can avoid developing a wrong kind of character. Is it possible to introduce such a spirit into our colleges and industrial schools?—A. Such a scheme appeals to me very strongly. I should like to see it tried in Bengal.

Q. That means the addition of a fairly large staff to carry out the scheme?—A. Yes, that would be necessary.

Q. I have heard a good deal from time to time of schemes proposed in Bengal for a technological institute and a school of mines and various reforms of the Sibpur Engineering College, many of which were attempted to be carried out for a short time and then abandoned. There is a state of feeling that there is no policy that nothing continuous has been done and there is no aim as far as technical and industrial education is concerned. I do not know if I have a correct idea of the state of affairs but if it is correct it seems to me that there is educational anarchy.—A. There have been a great many schemes which have not only not materialised but they have not even been worked out to definite conclusions. A detailed industrial scheme was worked out for Eastern Bengal and Assam by the Government of that province; this scheme centered round the Dacca Industrial Institute. A complete and elaborate scheme for the establishment of a technological institute in Calcutta has also been evolved. Not many years ago it was decided that the removal of the Civil Engineering College from its present location at Sibpur was a matter of imperative and urgent necessity. The sale of the site to the Port Commissioners was actually sanctioned by the Secretary of State. Many problems appear to have been involved in this removal and they were discussed at great length both by Committees appointed *ad hoc* and in the Secretariat. Then came the repartition and discussion broke out again. All that I have been able to do is to write a history of the whole business.

Q. Many of these have been started?—A. Nothing whatever has been started except a tinctorial department at the Sibpur College and that has been closed, because there were no students.

Q. And there was an agricultural section started.—A. There was at one time an agricultural section at Sibpur but that was closed years ago. The question of agriculture did not come into the chain of discussions which I have just outlined.

Q. Does not mining come within the chain of discussions?—A. The whole question has pivoted on the Sibpur College and its future. As you know, the Sibpur College now has a mining class and it has also a collegiate department of civil engineering and an apprentice department. The idea was that the collegiate department of civil engineering should become part of the Dacca University and that the mining instruction should be transferred to a school of mines in the mining district. A scheme was worked out for a school of mines. The apprentice department of Sibpur was to form the nucleus of the Technological Institute which was to be established in Calcutta. You can imagine that all these proposals involved considerable expenditure.

Q. It has been suggested to us that technical education ought to be made an imperial question that, for instance, our engineering colleges should be so governed that they should be colleges for all India, for instance Sibpur College would not be for Bengal alone, that there ought to be some scheme of imperial technical education and that the colleges should be specialised for particular branches of engineering or technology. Have you thought out that scheme?—A. It seems to me that as regards the training of the higher grade of engineers a system of Imperial colleges would be the best. I do not see any particular advantage in having engineering colleges under provincial Governments but then I am thinking only of the collegiate department of engineering. I am not thinking of the Sibpur apprentice department.

Q. That of course is a kind of training that might be reserved for the Local Government?—A. Yes, and I fancy that the reason why the people who worked out a scheme for an engineering college at Dacca dissented from the idea of a system of Imperial engineering colleges was because they thought that the Dacca University was going to be a teaching

University of a modern type and they conceived that it would be a great advantage, if the training of the higher grade of engineers could be made a part of the work of the University.

Q. You would not object to some scheme of that kind in which all the higher forms of technological and engineering education and research should be conducted by an imperial machinery while the industries should be run locally and consequently the artisan's education should be conducted by local Governments?—A. So far as I can see, I think that this would be a very much more effective way of dealing with the matter.

Q. What about the difficulties of boys going from one college to another?—A. A Bengalee would gladly go to Roorkee if he had the opportunity. People come to Sibpur from Burma, Bihar and Orissa.

Q. Would there be any difficulty about hostel accommodation?—A. We have never found any difficulty. Bengalee students go to any part of the world. Apart from the Government scholarship holders, there are a number of boys sent annually by the Association for the advancement of scientific and industrial education of Indians to England, America and Japan. So far as I know, this Association has never experienced any difficulty in finding recruits, nor have these recruits ever shown any reluctance to leave India and go anywhere.

Mr. C. E. Low.—Q. Your note points to the fact that the examinations at present conducted are now little else but a passport to entering Government service?—A. They are the necessary preliminary qualifications.

Q. A youth has nothing else to do, after passing the examination, except the exercise of necessary tact, diplomacy and influence?—A. I understand that this is largely the case.

Q. These examinations have been viewed by Government as means of assisting in the selection of candidates for Government employment?—A. Yes. Even the Sub-Inspector of Police must now be a B. A. (practically).

Q. Do you think it is right for Government to throw that onus on to educational institutions and save itself the trouble?—A. I think that the question which you have just asked me is a very difficult one.

Q. Have you ever considered the idea of educational institutions being allowed to have their own examinations for their own purposes and the Government itself assuming the duty of conducting examinations for the various branches of the public service?—A. I have often.

Q. Do you think it is a practicable idea?—A. I am not quite sure. One hesitates to be dogmatic about anything in India, least of all about educational problems. There is certainly a good deal to be said for your suggestion. What I feel is this:—The present system makes any real University education difficult, if not impossible. University teaching should be "scientific, detached and impartial." This necessitates the teachers enjoying a considerable degree of freedom but so long as University qualifications are the necessary preliminaries to admission to Government service or the favoured professions, so long will the community never acquiesce in the University teachers' teaching what they like and conducting their own examinations.

Q. Is not that position created by the Government? To a certain extent it renders it impossible for an industrial bent to be given to boys under our present system of education?—A. Yes. The tendency of selective education is always to sacrifice industry and agriculture to the professions. I have before me some notes from the Board of Education and from them I find that from the London Public Elementary Schools, the best boys go with scholarships to the secondary schools, the next best go to the central schools, while technical schools are recruited from the residue. This tendency cannot be tolerated indefinitely. The position has got to be adjusted.

Q. Don't the boys regard scholarships in technical schools and scholarships for technical instruction in England much more as an end in themselves than a means of obtaining technical instruction?—A. That is the case. We pay a research scholar Rs100 a month which is in many cases more than he can hope to earn when the term of his scholarship is over. Naturally the ordinary Bengalee young man (and many of the research scholars are very ordinary) would like to continue to be a research scholar for an almost indefinite period.

Q. You say that the students leave technical school fairly early and one reason was suggested that it was because there was a demand for their service. Is there not perhaps a greater reason than economic pressure to earn something for themselves and their families?—A. I think that this is to some extent the case. I should like however to qualify this statement by a suggestion which I have already made. The Bengalee student who finds his way to the apprentice department at Sibpur has almost invariably started out with the hope of eventually securing a M. A. or M. Sc. degree. If a student has for some reason or other fallen out of the University course, he goes to an engineering college or to some other technical institution. When therefore a student comes to the engineering college he has practically abandoned all his brightest hopes and whether he stays for the whole course or not does not seem to matter much.

Q. Have you found by any chance that a boy of well-to-do family taking up technical education is more likely to stick up to it than the poorer classes?—A. I do not know of any example. I do not say that such cases do not exist.

Q. You expressed yourself in agreement with the idea that the higher engineering institutes should be Imperial. Would the provincial Governments in which these institutions are

situated retain some kind of connection with them?—A. I suppose they might. It would not be impossible.

Q. Would it be a good thing entirely to divorce the United Provinces Government from all interest in the Roorkee College or the Bengal Government from all interest in the Sibpur College?—A. Certainly not from Sibpur as it now is.

Q. As it would be, if it were a civil engineering college?—A. The Local Government should certainly continue to take interest in the college. It might do so by means of a local committee. The institution would be a loser if the Local Government had no connection whatever with it.

Q. I do not want to raise the question as to the functions of the Director of Industries. I only want to ask you whether you would not agree that the Director of Industries should be at any rate responsible for all local demonstration work and the teaching of particular processes in particular industries—the teaching of actual processes without reference to general principles?—A. I agree entirely. I want the Director of Industries to have as much power as possible.

Q. That is to say, for instance, the teaching of the use of fly shuttle is purely a matter for the Director of Industries?—A. The Director of Public Instruction should have nothing to do with a matter of this kind.

Hon'ble Pandit M. M. Malaviya.—Q. You remember this question of the effect of Government taking in graduates and other educated men into Government service was considered by the Education Committee of 1882?—A. Yes.

Q. And they pointed out that it had a great effect in promoting the spread of education?—A. Yes.

Q. What advantage would, in your opinion, be gained if the other system is adopted, namely if the Government should hold its own examination for admission to the public service?—A. It would set higher education free.

Q. Would it not at the same time check the spread of higher education?—A. Not necessarily. It might encourage it. I do not think you can say that the establishment of the higher civil service examination in England has in any way checked higher education in that country.

Q. It is not a fact of men who want to compete for the civil service examination in England go to the Universities for education, at least many of them?—A. Yes, a great many.

Q. You have a system here also of examinations for particular professions, the legal, engineering and medical?—A. The higher ranks of the legal, engineering and medical professions in Bengal are all approached *via* the University.

Q. Is there a separate examination for entering the medical professions held in England?—A. You need not go to the University at all. A very large number of people never go to the University.

Q. Medical men?—A. Yes, medical men.

Q. If then there was a special examination, for instance, a competitive examination for admission into the higher grades of the public service, the object you have in mind would be attained?—A. I think it would be a very great improvement.

Q. Was not a system of a competitive examination for the provincial executive service in force in this province for some years?—A. There was and it has been modified. I am not sure about the facts, but it has been modified. I believe, speaking subject to correction, that the authorities wanted to get more local representation. I fancy the system of nomination is more or less a local system. All the candidates nominated must be graduates or a very large number of them.

Q. That system of competitive examination did correspond to the system that you have for admission to the public service in England?—A. Not exactly.

Q. It was a competitive examination for the posts of deputy collectors?—A. Yes, I believe so.

Q. Certain qualifications were laid down?—A. Yes.

Q. And only those who possessed those qualifications could compete for the examination?—A. Yes.

Q. So it did correspond to the system of competitive examination that you have for the civil service in England?—A. Any one can compete for any civil service examination in England with a few special exceptions, such as the Diplomatic service and clerkships in the House of Lords. There is ordinarily no question of preliminary qualifications.

Q. In the place of that you now have only a system of nominations by different bodies who have been empowered to do so?—A. Something of that kind.

Q. There is no examination held now?—A. Not, I understand, for the Provincial Executive Service. There is one examination which is still held and that is the Finance Department Examination which is conducted by myself.

Q. Except so far as the Finance Department examination is concerned, the Government here have deliberately abandoned the system of competitive examination for the executive service and have substituted for it a system of selection, from among the graduates of the

University who have been recommended or nominated by certain bodies?—A. Yes. But the change was made some years ago. There has been an enormous expansion of education in Bengal since that happened.

Q. But is that the system now in force?—A. Yes.

Q. You have given us some figures from the report of the committee on education?—

A. From certain notes that I have got from the Board of Education.

Q. Then we find in England that the best boys from the elementary schools do not go to the technical schools at present?—A. Yes. The statement refers specially to London, but I suppose that it is fairly typical.

Q. That is the case in England when there is a great deal of provision for imparting technical instruction there?—A. Yes.

Q. Since the Technical Education Act was passed many years ago?—A. There are now in England a large number of engineering schools, trade schools, technical institutes and polytechnics.

Q. It is not surprising then that in the absence of any system of technical instruction here you find our boys going largely into the University?—A. I consider that what has happened here is exactly what one ought to have expected would have happened.

Q. The remedy for it in your opinion is to introduce, in addition to a system of general primary education, a system of industrial education?—A. Yes. I have not worked that out.

Q. It is a fact that England has been more backward in the matter of systematised technical instruction than Germany?—A. Very much so. I do not think that people out here realise that.

Q. And therefore it is not much good asking us to go for a model to England for providing systematic technical instruction for our youths. Have you studied the system which is in force in Japan?—A. Not closely. I know something of the German system and the French system. I am not clear about the Japanese system.

Q. In the German system, am I right in saying that in addition to the elementary technical instruction they provide they have a system of higher technical schools in which very good and efficient technical instruction of the highest kind is provided?—A. Yes.

Q. Therefore if you have a system in which, in addition to general elementary education, you have elementary technical education provided and in addition technical education of the higher kind such as is given in the higher technical schools in Germany, that is likely to give a very decided turn to the minds of students in Bengal in favour of industrial work?—A. I think that unless you make it more difficult for a boy to approach the thing which he wants now, namely, the secondary school and the university, unless you make it more difficult for him and a little more expensive than it is now to go to a secondary school and then to a university it will be a very long time before he will go of his own choice into other lines.

Q. I understood you to say in answer to a question by the President that the standard prescribed for the degree examination here is quite as high as in England so far as the pass course went?—A. I say that the standard of any examination finally, and frequently before very long, adapts itself to the general intellectual level of the candidates who go up for it.

Q. In the Calcutta University you have been familiar with it for many years has the standard of education been lowered or has it been raised during the last twenty years?—A. It is rather difficult to say.

Q. What is your general impression?—A. My general impression is that the Matriculation standard has been lowered. That is a statement which is often questioned. Some people say that it is not so, but that the schools have improved. I say that the standard of Matriculation is deplorably low.

Q. In the matter of a knowledge of English or of other subjects?—A. English is very bad and other subjects are not good. The top classes of certain high schools in Bengal have recently been tested in arithmetic by one of my Inspectors by means of test cards which are given to children of 10 to 12 years of age in the Public Elementary schools in England. The average percentage of success in the high schools here was 33 per cent.

Q. Do you ascribe it to the standard being low or to bad teaching?—A. I ascribe it to bad teaching. In Bengal a number of schools have sprung up very quickly in response to the desire to compete at certain examinations. These schools have not got enough money. The teachers are paid starvation wages and they only exist by coaching their own pupils out of school.

Q. So far as the standard prescribed by the University is concerned, you have nothing to complain of?—A. The number of schools and the number of pupils have increased rapidly. The demand has outstripped the capacity to meet it efficiently. This in itself would tend to depress the standard.

Q. In the case of the B. A. and other degrees, the standard is not low but it is the teaching in the schools you complain of and you say that the boys go to the University less prepared than they should be?—A. I have had recently no personal experience of it in the colleges. I have no hesitation in saying that the standard of teaching in the secondary schools is deplorably low and that under the conditions under which the work is being attempted efficiency is impossible. The teacher is seldom trained, and even if he is, he cannot

possibly teach 50 boys at once, or generally work intelligently under the conditions under which he is forced to work.

Q. My point is this. You have said you have not compared recently the standards for the degree examinations and you have not been an examiner for some time. But I understand you to say that so far as the pass degree in England and here can be compared, the Indian degree compares favourably?—A. The pass degree in England of any residential University is not worth very much but it represents three years of systematised study in circumstances and in an environment which is out of comparison to anything which could be under existing conditions obtained in India.

Q. You have got in addition the honours course now?—A. Yes.

Q. And in addition to that, several students go up for a two-years course for the M.A. degree which you do not have in England?—A. Yes.

Q. Why do you suggest then that if you raise the standard of the degree examination and of the school final, it would be a proper alternative to attracting students to industrial lines?—A. My position is that too many students are attracted to the University courses.

Q. Because too many are attracted to the University, for that reason alone you would raise the standard higher?—A. I think that too many people are trying to follow the same careers.

Q. You have said that Bengal students love University educations. If you have higher technical education provided in the University, do you not think that without any raising of the standard of the Arts degree students will be drawn towards the technical side in large numbers?—A. The University degree in arts or science is of some value. There are openings for those who have secured university degrees even though the good openings are out of all proportion to the number of competitors for them. You cannot expect a man to go to a technical college, however high the standard of the institution, if he is going to be stranded afterwards.

Q. So far as the technological branch of study is concerned, don't you think there will be employment found for many a young man of University qualifications who went in for electrical engineering?—A. I have seen the matter discussed. There appear to be a good many openings for practical men.

Q. The man who has had practical experience in addition to University education?—A. Practical experience is indispensable. I don't consider that a University course is necessary or even desirable in every case. It depends on the capacity of the man and the sort of work which he is likely to have to handle.

Q. And also for mechanical engineers?—A. Yes.

Q. And industrial chemistry is also largely coming into play at present in Calcutta in the various mills?—A. Probably.

Q. For instance in the paper industry and the jute industry?—A. The fact remains that at the present time there are at least six chemists known to me who have done well in institutions in England and have had some practical training. They are all looking out for employment in the Education Department and all those who have not got it except one who has got some work in Tata's works are doing nothing.

Q. But, so far as you are aware are these European firms willing to take in Indian students who have passed in industrial chemistry?—A. I do not know. Apparently they are not willing to take in young Bengalees on the terms on which they wish to enter the firms. I have no definite information as to what terms if any they have been offered by those employers.

Q. You say "In many, if not in the bulk of cases, highly capitalised industry on European lines is not possible in this country"?—A. Yes.

Q. You did not have in your mind the cotton and the jute industry?—A. I meant local industries.

Q. You have advocated the apprentice system but you have also in one place condemned it?—A. I am not sure that what I have written is really contradictory. I am in favour of the system but am doubtful as to how far it is practicable.

Q. You say, "In a word, apprenticeship, in its true meaning, training by personal influence and imitation, will not suit the large industry." That is the conclusion you have come to. For training men for the large industry, you would require technical schools with workshops attached to them?—A. I suppose that they could be trained in the factories themselves.

Q. But you say that it is not suited for large industries?—A. The man who gets training in a factory is not necessarily an apprentice. By apprenticeship I mean a personal sort of relation between the craftsman and the pupil.

Q. From what you have heard do you think it is likely that our existing large industries will take in a large number of students as apprentices?—A. They are taking apprentices in the railway workshops and in the workshops of engineering firms.

Q. Would they be able to take in as many students as you would like to train for meeting the demands of our growing industries?—A. I think that the training which the workshops can give will have to be supplemented by a system of schools working in co-operation with the shops.

Q. Your experience of the artisan classes has been very unsatisfactory. You think that the boys do not stay. Don't you think that, if you improve the teaching, if you provide a better course which would have a market value, they would come more readily, even without scholarships or stipends?—A. Honestly with regard to the artisan schools of Bengal, I am absolutely at the end of my tether. They exist and we do not seem to be able to make any progress with them. As to what is wrong I am not quite sure. I have put down in my note certain difficulties which have occurred to me. A Director of Industries who could look into them from the point of view of the local industries might be able to do something. I can only tell you that at present they are not doing much good. There are not very many of them.

Q. You say "The ordinary Bengalee parent prefers to invest the capital in some less risky venture on behalf of his child." But are not industries and factories growing in Calcutta and around it?—A. Yes.

Q. But how much of the capital sunk in them came from Bengalees?—A. You don't see many factories in the mofussil.

Q. In and around Calcutta there is a great deal of employment available for trained artisans in the various mills?—A. Very little of this labour is Bengalee.

Q. In the jute mills, the Bengalees are not many?—A. Practically non-existent.

Q. In Jessop's works I understood there were many Bengalees employed?—A. Possibly. The steamers of Eastern Bengal are entirely run by Bengalee labour (*serangs*, engine room men, *mistries* and every one else). But these excellent men are not products of industrial schools.

Hon'ble Sir Fazulbhoj Currimbhoy.—Q. Suppose you got technical and commercial colleges as in Bombay do you think they would attract the intelligent class of students in Bengal?—A. Not to the same extent as in Bombay.

Q. Many of our boys who pass out of our technical college in Bombay go upcountry to the United Provinces, the Punjab and other places and in turn we have many students from upcountry?—A. The Vice-Principal of the Serampore school was till recently a Parsee.

Q. About the Director of Industries, do you think that he ought to be a business man or a service man?—A. It is a little hard to say until one knows what he is going to do. I do not suppose you are likely to secure the services of a very effective business man on a pay of Rs. 1,200 with a two years' probation.

Q. Do you think that the capitalists of Bengal who are now thinking of starting industries will be tempted to send their boys to the industrial schools if they are started instead of to the literary schools?—A. If there were openings in industry for Bengalees, whether trained in industrial schools or not, I am fairly sure they would try and take advantage of them. Whether the boys of this class would make good in industry or not is another question.

Sir D. J. Tata.—Q. Don't you think that the technical schools and other institutions of the kind which are advocated are a little too theoretical and much better work could be done by the factories themselves in training their own men for their own work?—A. My feeling is that probably the best results would be obtained by the Government working with the factories. I think that the scheme now under consideration the object of which is to link the Sibpur apprentice department with the training given in the railway workshops and other places is on the right lines.

Q. But if the factories themselves train the men they want for their own use, and give them a little technical education outside by night schools and things of that kind, would not that be a practical solution of the training up of people for particular classes of work? I am speaking from personal experience of the work we do in our cotton mills at Nagpur. We have a system of apprenticeship which has been in existence ever since the beginning of the mills which were started sometime in the seventies. We train up all the men we want from our works from the lowest to the highest department. We began by having Lancashire men; these men came out and taught everybody that we placed under them; they were bound to teach them all they knew and if they did not turn out satisfactory pupils they were liable to be sent away; in this way in a very short time we manned our mills entirely by Indian labour and did away with the imported skilled labour and every post right up to a manager was filled up by Indians trained under us. We found that very satisfactory. As a matter of fact, we find that men who have been apprentices with us and trained under us can always get appointments outside on double the wages that we can offer them in preference to the technical school men and men from the technical colleges because they are not practically trained in the ordinary work of spinning and weaving and all the other departments. Don't you think that it would be a better way of training up people if the factories themselves trained the men they wanted?—A. I think on the one side there is danger of the technical school being divorced from the real work done in the workshops and therefore it seems to me to be beyond dispute that somehow or other the school and the workshop have got to be brought close to each other. The danger of workers being trained only in the factories is that this system is apt to overlook the fact that the worker is not only a worker but that he is also a man and requires something more than mere technical training. Possibly that difficulty will not be felt in India for some little time yet but it will be felt later on. What is needed is that the factory and the technical school should work together.

Q. For all practical purposes we have found that the men we have trained give better satisfaction. We have tried technically trained men and they do not give us satisfaction because they have no practical knowledge?—**A.** The Eastern Bengal State Railway are not satisfied with the products of Sibpur. On the other hand they realise that the workers who have become employes of the Railway after undergoing the present system of apprenticeship in the shops can't go very far. They want to have a technical school at Kanchrapara and they want our assistance generally in connection with the general as opposed to the specific training of their apprentices by which the better qualified apprentices might take a course of instruction at Sibpur in supplement of their apprenticeship in the shops. Of course the dissatisfaction of the Railway authorities with their locally recruited worker is largely due to the fact that the boys who go into the workshops as apprentices go there with very low educational qualifications. All that I am suggesting is that your workers must have some intelligence in addition to mere mechanical skill. Your training will tell in the long run on the efficiency of the workers and consequently on the vitality of the industry.

Dr. E. Hopkinson.—**Q.** You stated in reply to a question of the President that there could be no development of industrial education without a much wider spread of primary education. That appears to me to be perfectly obvious, because industrial education cannot be imparted unless the students can read and write. Even an elementary mechanical drawing cannot be understood unless the students can read figures and tables. We have been told again and again by the manufacturers that they prefer to have boys who have had no primary education. They state that they make better workmen if they cannot read or write. Apparently the reason is that if they can read and write before going to the factory they get a bent of mind which develops in the wrong direction. A solution suggested by several manufacturers is that concurrently with work in the mills the boys should receive some primary education in schools attached to the mills. Has this method of the introduction of some system of manual training been discussed?—**A.** Everything has been discussed. In the present state of affairs in Bengal one cannot talk of a primary education system. The idea with which primary education is approached is that it will lead to something else. It is so bad that unless it is going to lead to something else the ordinary villager does not see any point in it and he is right. The primary school in Bengal is the first sieve in the selective agency but there is a large percentage of children who do not go to school. Those who touch the selective agency at all are apt to feel disinclined to settle down to their family avocations. They want to try and be something else, e.g., clerks.

President.—**Q.** What could be the effect if you made primary education of the right kind compulsory?—**A.** I think it would solve the problem. Education is an unsettling influence so long as it is confined to the few. The demand for instruction in English in Bengal is largely due to the fact that such instruction is comparatively speaking difficult to secure. If English were open to all, the fact of its acquirement would become of no inherent value. In the artisan schools I find that very few pupils can understand a design at all. As regards the mills, the managers of the mills around Calcutta would not mind having a school in the mills compound but the reluctance comes from the people employed. They don't care about their children having this education. The position of the managers of the mills is a perfectly reasonable one. They cannot force education upon their coolies; if they tried to do so, the coolies would go away.

Dr. E. Hopkinson.—**Q.** I gather from you that in Bengal at any rate as soon as any one starts on an educational career he begins to get engulfed in a downward stream which ends in the Calcutta University?—**A.** He does not always get there but most boys have probably a hazy idea that they might get there with luck. Look at the entire collapse of the middle vernacular school: It is a school which teaches a stage beyond the primary school but gives no instruction in English. The Government of Eastern Bengal and Assam tried to organise these schools but they are ceasing to exist because nobody will go to them. What is wanted is a better school which teaches English but has a practical bent.

Q. I am not quite clear whether if industrial schools are started provincially, you consider they should be entirely under the control of the department of Public Instruction or not?—**A.** It would depend very largely on the form which these schools would take. It is not quite clear to me for example with reference to the various proposals which have been made, what the difference is between a demonstration factory and industrial school. I do not see very much difference except that the industrial school will probably throw in a little teaching in reading, writing and arithmetic. If the industrial school in Bengal is simply a workshop in which people do tinsmith's work or blacksmith's work and if that is going to be the form of the industrial school, I think it had better be under the Industries Department.

Q. Take two concrete examples, the School of Carpentry at Bareilly and the School at Lucknow?—**A.** It seems to me they are quite well off as they are. They have got very good men in charge of them and strong local committees and I do not think there would be any point in taking them away from their present system of control.

Q. It is not a question of altering the personnel but of the ultimate authority. Is it to be under the Department of Public Instruction or the Department of Industries?—**A.** When I was in London the Government of India referred this question to the Board of Education. I was strongly of opinion that the ultimate department must be the Department of Education, but out here since I have come back, I have found that a good many practical difficulties stand

in the way of what was formerly my ideal. I find also that it is very difficult to divorce this question from the much larger question what sort of shape the Education Department is going to take.

President.—Q. What we were told was if they taught merely handicraft they might be under the Director of Industries, but if in addition to it, they taught drawing and mathematics they should come under the Director of Public Instruction?—A. I think on the whole, speaking from my experience of the last two or three years, that it would be better to have them under the Department of Industries. Otherwise there is a tendency to divorce them from actual industrial conditions.

Q. We have been told a great deal about the advantages of the system of education in Germany and Japan. Do you think there is any virtue from the educational point of view in elementary education being compulsory? Does it make a fundamental difference whether your elementary education is optional or compulsory. If it is optional, it leads to what you have described. If it is compulsory, would it prevent that result, and would it also be better for the boy from the educational point of view that he should be compelled to do something from the very beginning?—A. The answer to both the last questions is, I think, 'Yes'. Of course it is very difficult to say in a country like Bengal whether the fact of compulsory primary education would have any great effect on the general efficiency of the population. I think that eventually it would probably have such an effect.

Q. Bengal has the highest figures for primary education of all the provinces in the country and from the industrial point of view its figures are the most unsatisfactory, that is to say, with the greater industrial development of Bengal its people is taking a smaller part in its industries. How are these two facts connected? There are high figures for primary education and low figures for industrial employment. Is this due to the fact that primary education is optional and not compulsory?—A. I think it is due to that partly, and partly to the extreme ease with which a person can pass from a primary to a secondary school.

Hon'ble Pandit M. M. Malaviya.—Q. If you give an industrial turn by making manual work compulsory these things would be different. The technical and industrial education, we are talking of, would provide agricultural education for the agriculturists also. It would enable them to do better agriculture?—A. Yes. It would give them something to look to other than the secondary school.

Mr. C. E. Low.—Q. Is it not a fact that a great proportion of boys who undergo primary education in Bengal do not reach the secondary school?—A. Yes. And many who reach even the high school stage never get as far as the Matriculation. That is not because they do not want to.

Hon'ble Pandit M. M. Malaviya.—Q. Because they are poor?—A. Very largely and because they cannot get up to the standard.

Q. If the system is made compulsory for every boy between the ages of six to fourteen, you must have immensely better results?—A. Yes. You cannot call the present system of *pandits* a system of schools. That will disappear with the compulsory system.

Q. As regards the cost, would it not repay itself many times in the prosperity of the people and the growth of business in the country?—A. As to the cost, the nearest figure that has been worked was when the Government of India made enquiries as to what it would cost to make the primary education which was then being imparted free and the figure then given for the old province of Bengal was 30½ lakhs increasing in five years to nearly 64 lakhs. It would be a great deal more now for the Presidency of Bengal. For a long time elementary education was compulsory in England but not free.

Hon'ble Sir R. N. Mookerjee.—Q. You have a vast experience of the cultivators of the Bengal rural areas. A cultivator, if he has five sons, employs three of them in his own work. He cannot afford to let all the five to go to school?—A. Certainly the jute cultivator could easily afford to send all his sons to the nearest primary school, if he desired to do so.

Q. If there is compulsory education up to 14 years, would it not be a hardship to many of the cultivators to send all their boys to school?—A. It would cause difficulty in some cases.

Mr. A. Chatterton.—Q. In 1901 the Director of Public Instruction suggested a very elaborate system of manual training. What became of that?—A. A syllabus was drawn up. It did not really mean very much because there it was little use asking the unfortunate *pandit* to give a kindergarten lesson. The Education Department took away the old reading books and introduced science primers. The changes then introduced went on until about 1907 and then we revised the system and the present Western Bengal curriculum is the result. It is really almost beyond criticism but it does not work. We are always telling the *pandit* that he should stimulate the children into the free exercise of their natural activities but there is one teacher usually for five classes and he has not very much time for intensive culture.

Q. Is it in force in Bengal?—A. The main principles. We modified the science primers. I can send you a copy of the syllabus. It is like the Board of Education syllabus at home. It is in existence but not in force. During the period which intervened between the putting forth of Sir Alexander Pedler's syllabus and the revision in 1907 a committee was appointed to consider whether a specially simple course for rural schools should not be prepared. This committee suggested that there should be such a course but it was subsequently decided that there was not much to be gained by differentiating a rural from an urban primary school.

Neither of these institutions did in fact represent more than irreducible minimum. The syllabus for Western Bengal was then revised as a whole and a few remarks were added as to nature study and environment and all that. In the girls' schools where they have trained teachers sometimes quite wonderful work is done in the way of nature study.

Q. Talking of industrial education in Bengal, would you be in favour of making it legally compulsory that apprentices should enter into indentures and be compelled to fulfil the terms of their apprenticeship either in an industrial school or a factory?—A. I think it is necessary. It is difficult to dispense with the system and if it is not worked properly, it will not work at all.

Q. Can you give us the origin of these Bengal industrial schools?—A. Mr. Heaton will tell you. My impression is that originally all the industrial schools were missionary institutions.

Q. From the information which you have, they are mostly employed in training artisans for the villages, and I should like to know whether you can express an opinion on the point; does the development of village life in Bengal require a higher standard of craftsmanship than that provided by the hereditary artisans?—A. My impression is that it does not. That is the chief difficulty.

Q. These schools are not fulfilling any useful functions?—A. One of the best schools, that is the C. M. S. School near Krishnagar, does very good carpentry work indeed and it turns out work which is on a par with the work of European firms. Its aim is to train village boys to be village carpenters, but the boys of this school unless they subsequently get into the railway workshops or into the shops of some Calcutta firm are practically drags in the market. All that a village carpenter has to make is a rough wheel or something of the kind. That he could learn to do by watching his father at work. The work of this school is good because there is European supervision. The boys do come down to Calcutta and sometimes get good posts and they certainly get employment in the carriage factories of the Eastern Bengal Railway. My point is that as a school for the training of village carpenters it has little scope.

Q. In regard to the industrial schools, would you advocate the schools confining themselves to the training of artisans pursuing their particular trade, that is to say, if you have a weaving school, you would only admit weavers into the school whilst in a general industrial school you would only admit the sons of carpenters into the carpentry section?—A. I think I would.

Q. There appears to be no information available here as to whether these persons are in a decadent state or whether the number of artisans is not sufficient to meet the industrial requirements of the people?—A. You mean the village carpenters and the like.

Q. Not village carpenters so much as village weavers?—A. They always seem to be able to get plenty of students in the weaving school whether at Serampore or the branch schools. Mr. Hoogewerf tells me those students are able to earn more when they leave the schools.

Q. Do you think you would combine elementary education in the industrial school or would you rather restrict the industrial schools to boys who have already had a certain amount of primary education?—A. The latter course would be preferable.

Q. Going a step further, do you think it would be wise to abolish these industrial schools and start afresh?—A. We might very well abolish the industrial schools in Bengal—I mean thereby the small artisans schools—and it would have very little effect on any one. The institutions are few; the attendance is very intermittent and you very seldom find a boy who goes through the whole course.

Q. In regard to the general industrial question would you subscribe to the statement that what you want to do in the first instance is to create industries, that when the industries have been created and the demand has been set up for specially trained artisans for technically trained foremen and skilled managers, we should proceed to supply that?—Or do you think that we should have technical institutions turning out a large number of students who have picked up a knowledge of mechanics and so forth and then turn them out to try and find employment for themselves? So far as our experience goes, these technically trained students who have gone on scholarships to England, Japan and so forth and come back with a certain amount of knowledge have not been able to find employment or to create industries?—A. Is it fair to expect any one of that kind to create an industry? You can turn out any number of people with a knowledge of chemistry and engineering who would roam about Bengal without creating any single industry in 100 years.

Q. What object would be gained by attempting to create educational facilities before we get industries?—A. It is quite useless.

Q. That is to say, we should direct our attention more to the development of industries and to importation if necessary of the men to do that work before we begin to train a lot of men?—A. I think that is so.

Q. We have heard about the success of the Victoria Technical Institute, Bombay. It turns out a very large number of students and they get employment and many of them do extremely well because there is a large market in Bombay for such students. That does not exist to the same extent on this side of India?—A. Take the dyeing classes in Sibpur. Some

few students came to them but I suppose they did not derive any practical advantage from the course, for admissions very soon dwindled to nil.

Q. My point is this, you want to set up a dye factory before you start to teach the art of dyeing?—A. Yes.

Hon'ble Pandit M. M. Malaviya.—Q. If you had many industries in the country in which dyeing is a necessary process, would it be better that you should have uninstructed uneducated workmen or that you should have men who have received some training in the principles of dyeing?—A. If you have got a dye industry it would certainly be better that you should have technically trained men.

Q. Would you subscribe to this statement of Mr. John Perrin? "The manufacturing country that depends upon a few good managers and an army of unintelligent slaves will fall as the Roman Empire fell"?—A. Yes.

WITNESS No. 116.

Mr. B. Heaton.

MR. B. HEATON, Principal, Civil Engineering College, Sibpur.

WRITTEN EVIDENCE.

Introduction.

Civil Engineering
College, Sibpur.

The Civil Engineering College of which I am in charge has two main departments.

I.—*The Engineer Department*—in which instruction is provided to prepare students for the Bachelor of Engineering degree (civil engineering) of the Calcutta University.

Students trained in this department are employed in the civil engineering departments of Government, District Boards, and Municipalities as officers and upper subordinates, while others are contractors.

Civil engineering, except so far as regards the construction of docks, railways, canals, roads and buildings, has little to do with industrial development.

II.—*The Apprentice Department.*

In this department there are four courses of instruction—

- (1) The sub-overseer or lower subordinate course preparing lads for sub-overseer posts in civil engineering. This course acts as a feeder to the following 3 courses.
- (2) The (civil) upper subordinates course preparing for upper subordinate posts in civil engineering.
- (3) The mechanical and electrical engineering course preparing lads for employment as mechanical and electrical engineers.
- (4) The mining diploma course (started in 1906). These last 2 are the most important as regards the industries of the country.

System of affiliated technical and industrial schools.

It has been noted above that the *sub-overseer classes* have been utilised as feeders to the (civil) upper subordinate, the mechanical and electrical engineering and the mining courses.

There were many minor technical schools existing in different districts of Bengal offering classes for the training of low grade surveyors and low grade men of the sub-overseer type and possessing workshops also for training carpenters, blacksmiths and in some cases tin smiths. These were under no definite control or regular inspection on behalf of Government and in 1891 my predecessor Mr. J. S. Slater was deputed to visit them and to make proposals for their control. He devised a scheme whereby the better schools became feeders to the Sibpur College. They taught the sub-overseer course and sent their lads up to Sibpur for examination by the Sibpur standard. Their artisans too could be admitted to Sibpur for advanced training. Machinery is manufactured at Sibpur cheaply for affiliated technical and industrial schools.

Lads who passed were to be allowed admission to the higher classes at Sibpur. At that time only the old combined upper subordinate course existed and lads could be trained for the old upper subordinate and foreman mechanic's certificate, some specialising in electrical engineering. The main idea underlying this scheme was that technical schools

Note.—The mechanical and electrical engineering course on its present lines is quite a recent departure. There have been only 2 batches of lads who have completed the present course. Previous to 1942 the civil upper subordinate and the mechanical and electrical engineering students were taught together and special instruction in electrical engineering was given only during the year of practical training that follows the final examination.

The present 2 special courses were introduced in 1912 with the object of improving the quality of both the civil and mechanical and electrical overseers trained at Sibpur.

should exist one in each district and that where a demand for higher instruction showed itself the technical school at that centre might be developed into an institution similar to the apprentice department of the Sibpur College.

As this scheme developed in 1899 the school at Bankipur was raised to the full Sibpur standard in civil engineering under the title the Behar School of Engineering.

In 1904 the school at Dacca was similarly raised and called the Dacca School of Engineering and proposals were got out for a similar school in Orissa for the benefit of the Uriyas. This has not matured; they have not yet even got sub-overseer classes.

The full scheme eventually became as follows :—

Courses.

Major institutions	{	The Civil Engineering College, Sibpur.	{	Civil engineering.
				Mechanical and electrical engineering.
				Mining.
	{	The Bihar School of Engineering The Dacca School of Engineering	{	Civil engineering only.

Each have artisan classes in carpentry, smithy, pattern-making, foundry work and motor driver mechanic at Bankipur.

The artisan classes at the major institutions have, however, mainly a local significance. Before they can be of real value to the province barracks should be built.

Each of these major institutions has in turn become the head institution of a province, so that both Eastern Bengal and Assam and Bihar and Orissa, when they were formed found themselves with a definite system of technical and industrial education.

In Bengal.

Minor Institutions	{	Burdwan—Sub-overseer and artisan classes.
		Midnapur—(Sub-overseer closed) Artisan classes.
		Rajshahi—Sub-overseer and artisan classes (Sub-overseer class will close).
		Pubna—Sub-overseer and artisan classes.
		Barisal—(Sub-overseer classes closed) Artisan classes.
		Comilla—(" " " ") " "
		Victoria School . { Sub-overseer classes for European lads, no artisan classes. Closed.
		Geothals School . {
		Kalimpoung—Sub-overseer classes for Europeans closed.

In Bihar and Orissa.

Ranchi—Sub-overseer classes and artisan classes.

The numbers appearing at the sub-overseer examination increased up to a total of 319 in 1910 and since they have dwindled to 148 in 1916, and this in spite of extra attractions being given in the shape of mining and mechanical and electrical courses open at Sibpur to their successful lads. This falling off in numbers shows the failure of this system of affiliated schools, also indicated by the closing of some classes.

I attribute the failure to be due entirely to the want of industries in Bengal and to the desire of Bengali parents to obtain service for their sons with prospects of a pension. Although we have offered at Sibpur courses in mining and in mechanical and electrical engineering to lads who have passed the sub-overseer standard, practically every Bengali has clamoured for admission to the civil upper subordinate classes and this preference has become more marked since we separated the mechanical and electrical from the civil overseer course. The result has been two fold—

(a) An over production of civil upper subordinates.

(b) That other means of recruiting for the mining and mechanical and electrical engineering course have had to be found, that is, a special preparatory class has been started for these courses only.

The above is the history up to the present date of the affiliated system of schools in Bengal, their rise and failure.

The system of instruction followed at Sibpur in all departments has been as practical as possible.

I consider that with a Bengali student, whose tendency is more towards philosophy and the abstract ideas found in law, we must take every possible means to bring his mind from the clouds, from thoughts of the abstract to the practice of the concrete.

His method of learning is expressed by the Bengali English word "by heart." Knowledge is not acquired easily even when it is learned how to use a

hammer and chisel how to weld a piece of iron, that knowledge cannot evaporate. The same way knowledge gained through experiment in the laboratory will remain whereas the same facts "by hearted" from a text book are never absorbed and moreover in this latter case we do not know that they have been understood, even though the arguments are reproduced in an examination paper.

At Sibpur in every junior class 3 hours daily are devoted to work either in the workshops or laboratories. In the senior classes more time is given to the drawing hall.

I do not think that most Bengali lads approve of these methods of instruction especially those that join us after passing the intermediate arts or science examination and are more fixed on their "by hearting" methods.

The Bengalis who come to the college for training have seldom been educated with the intention of becoming engineers. This may be because the facilities for training engineers are limited, but chiefly I think because the profession does not appeal to the average Bengali. Students apply for admission to a great number of colleges and join where they can. Those that join the university classes at Sibpur have in the majority of cases failed to obtain admission to the medical or to another college.

The schools that prepare students for the matriculation, teach a lad the minimum number of subjects needed to pass that test, none of them attempt to prepare lads to study engineering. There are no facilities for learning drawing, carpentry or science; few candidates for admission to Sibpur have taken additional mathematics or mechanics. The lad that joins Sibpur from a Bengali school has not had the same chances of fitting himself to join an engineering college as a public school lad in England. Regarding the general remarks just made we may note that at some Government schools arrangements were made in 1901 to offer a choice of studies in the two higher classes; what we call B. classes were started; here drawing, science, surveying and manual training were taught.

The total number of students appearing at the B. final examination (conducted by Government at the same stage as the matriculation) is now only 46 from 8 schools as compared to a maximum in 1912 of 133 from 12 schools.

Lads who pass the B. final are permitted to join the 2nd year class of the sub-overseer examination, whereas matriculates join the 1st year class. The university recognises the examination but demands that a lad shall qualify in a second language before admission to a college. They give him no credit for his proficiency in drawing, science or manual training. This may to some extent account for the want of popularity of these B. classes.

The governing body of the Civil Engineering College are now further considering the question of the recruitment of students for the mining and the mechanical and electrical engineering classes at Sibpur.

Mining classes.

With reference to the mining classes a report has been written by Messrs. Adams, Glen George and Robertson, advocating a closer connection with the coal fields and suggesting that as it is difficult for lads to get in touch with colliery managers to undergo apprenticeship, it is better to recruit direct to Sibpur and to arrange for students to undergo an apprenticeship on a mine after completing a short course at the college and that they should come back afterwards to complete their special college training in mining.

Mechanical and electrical engineering.

A report is under preparation by Messrs. Hornell, Adams, Harnett and Heaton, which suggests a connection between the mechanical and electrical engineering classes at Sibpur and the apprentices under training in railway and commercial shops in the presidency. It is thought that if picked lads be taken into the college after having completed four years of an apprentice course satisfactorily they will be of more immediate value to employes on passing out of Sibpur than those who have only been through a college course.

One great advantage of such a scheme is that we shall recruit through it only lads who have grit and who are definitely committed to the profession of mechanical engineering, and it is probable that we shall turn out a greater number of those who will eventually succeed.

At present by direct recruiting I admit many lads who are wanting in determination. From 33 to 50 per cent. of those admitted do not reach their second year; they leave because they don't like work in the shops or for other similar reasons and the time, expense and trouble in training them has been lost to the country.

We propose to continue to make direct admissions to the college, as well as from these workshop apprentices. As the college now stands with its future still undefined, whether it will remain where it is, or be split up into a technological institute in Calcutta, and a school of mines at Dhanbad and a civil engineering college at Dacca we cannot expect any large development at Sibpur. We need an immediate increase in both class rooms and residential accommodation. The class rooms are insufficient in number, it is necessary to teach certain common subjects like mathematics and science to civil, mechanical and electrical and mining students together, they cannot be split it into batches so that if 60 be the maximum number that can be seated in one room, I can only take in 20 to study in each of the 3 branches, or a total of 60 in all.

If I take in 20 to study mechanical and electrical engineering these 20 should be determined to stay and be recruited of the best material available. I hope therefore to be able to fill up with a large proportion of apprentices from railway and other shops.

Besides my duties in connection with the purely professional classes at the Sibpur College I have had certain experience of industrial education. Industrial education.

I.—At the Sibpur College.

- (a) We had agricultural classes from 1897 to 1908 when they were removed to the Sabour Agricultural College. The Sibpur classes were not a success because guaranteed posts of deputy magistrate and sub-deputy magistrate were offered yearly as a bait to attract the "bhadralog." The bait was far more attractive than the study of agriculture and helped to fill the classes with the wrong sort of student, though doubtless producing excellent magistrates. Practically all students who attended were seekers for employment under Government.
- (b) We have had classes in dyeing from 1910 to 1916. In 1906 I put forward proposals in collaboration with Dr. Watson for classes offering a training to fit lads for work in connection with industrial chemistry, these proposals were limited by Government to bleaching and dyeing. The classes have not been a success, probably because the cotton mill industry is not so extensively developed in Bengal as in Madras, Bombay and in the Central Provinces. Two years ago I failed to obtain any suitable Bengali candidates for admission and on reporting the matter I was instructed to try to keep the class going by getting students from other provinces. I received that year in all 11 applications only 3 of whom joined the college. For the present session I received only 3 applications; 2 were of poor calibre for whom an artisan training might suffice. As in the previous year only 3 materialised out of 11. I might expect one at the most out of 3. On reporting the matter I was instructed to close the classes. They would have come to an end the following year any how as the Secretary of State had only sanctioned them as an experimental measure till the end of the 1916-1917 session.

An interesting point occurred in connection with these dyeing classes. The professor of dyeing urged me to try to affiliate the classes to the Calcutta University urging that if we could offer a B.Sc. degree in tinctorial chemistry we would get plenty of students.

I opposed this as it is no good holding out such a bait if no employment could be found.

Moreover I do not consider that a cumbersome body like the Calcutta University is the best controlling body for industrial education. Such is best given in the closest connection with industries and the controlling body should be mainly composed of manufacturers who have a direct interest in the training of the student in view of their future employment and whose active co-operation is essential.

I can't imagine busy manufacturers having the time to give to university matters or the patience to attend the interminable and inconclusive discussions on the Senate or Syndicate, discussions which are largely concerned with educational problems of an entirely different nature.

- (c) *Workshop artisan classes.*—We have useful classes of this nature in the Civil Engineering College shops.

We take lads, mainly the sons of mistries for training in carpentry, smithy, fitting turning and foundry work, and we give them instruction in trade drawing.

The full course is a 5-year course. As there is a great demand for labour around Calcutta many lads want to leave as soon as they have learnt the use of their tools.

If they leave at this stage they may never become really expert. To induce them to remain we offer them stipends varying from Rs. 3 in the 1st year to a maximum of Rs. 10 and at the same time we credit them every month with half the value of the labour they have put into their work; this is allowed to accumulate and lads on leaving occasionally draw from Rs. 300 to Rs. 400 from this source.

II.—Outside the Sibpur College.

I am Secretary of the Mining Education Advisory Board of Bengal and Bihar and Orissa to whom is entrusted the control of evening classes for mine assistants in the coalfields of these provinces. The object of these lectures is to direct the reading of assistants and to help to qualify them to pass the colliery managers examinations.

- (a) *English lectures.*

A full time instructor, Mr. H. C. Read, is employed, he lectures once weekly at each of the following centres:—

in Bengal:—Raniganj, Deshagurh, Charanpur
in Bihar and Orissa:—Sijua, Jherria.

The lectures take place from September to April when an examination is held, on the results of which certificates are given. This last year Mr. Read has started classes in the elements of surveying during the other months.

(b) *Vernacular lectures.*

A start has been made in giving instruction in the vernacular to the Bengali and Hindi speaking employes of the collieries.

Bengali lectures have been given in the last two cold weather seasons and Hindi for one season only.

These promise well.

Previous to 1910 I was ex-officio Inspector of Affiliated Technical Schools, but this work was taken from me on the appointment of the Superintendent of Industries.

Apprenticeship
system.

I do not believe in industrial classes run by Government at technical schools in mofussil districts; they cannot be properly controlled from Calcutta. It is extremely difficult to induce local authorities to take an active interest in them, or to place any orders with them for work. The training is generally limited to carpentry and blacksmiths' work though sometimes tinsmiths' work is also taught. The mistry teachers of these schools are often of poor calibre, far better results would be obtained by apprenticing lads to commercial work-shops and arranging for some instruction in drawing. Workshops are the natural schools for industry. The managers are vitally interested in improving the skill of their labourers. So far as artisan training is concerned managers should be encouraged to admit artisans for training and provided that proper arrangements are made for the teaching of trade drawing they should be given assistance by Government in the form of a capitation grant.

Industrial schools.

I am of opinion that industrial schools should be under the control of a Department of Industries, they need a far closer contact with industries than with schools, and though doubtless it is necessary that in some industries instruction should be provided for drawing and design of a trade description, I think that this should be given by men employed in the trade who can explain its technicalities and application rather than by teachers employed by the Education Department who have no direct knowledge or interest in industry.

The Department of Education should have no voice in the control of industrial schools; they cannot judge results; and it is results that you look for in industrial education.

The ordinary Inspectors of the Education Department will not have the necessary knowledge or training and their influence would tend to make the artisan training lose touch with industrial conditions.

Training of super-
visors and of skilled
managers.

The training of supervisors can only be undertaken in workshops. Such men must have a practical knowledge of engines and machinery; they must be familiar with the conditions of work in shops and must be able to control labour.

They are best trained through apprenticeship in large workshops where there is an adequate foreman staff and they can be properly looked after; they should be compelled to attend daily for technical instruction at a properly staffed and equipped mechanics' institute.

Here the bulk of them will be trained as mechanics and they will eventually become foreman mechanics capable of taking charge of a section of a large workshop or a minor industrial shop.

The cleverer lads will soon come to the front during apprenticeship and arrangements should be made to enable these to finish off their education by joining a well equipped and well-staffed college for more advanced training in theories and in laboratory work which cannot well be arranged at the mechanics' institutes they attend during their workshop apprenticeship.

A scheme putting forward such proposals is under preparation for the governing body of the Civil Engineering College.

We do not propose to confine the college training to lads who have been through 'workshops'; we propose to admit a certain number of lads direct to the college classes and to give them their full diploma only after the satisfactory completion of a further 3 years period of apprenticeship. The two methods of training should go side by side.

The type of Indian whom we should now attempt to train in India for industrial enterprise is the assistant manager or foreman; the better of these will doubtless rise to be managers. They are best trained through the school of practical experience accompanied by a modicum of work at college to enable them to understand the theories.

The university type of man, namely a man who takes his scientific training before he has acquired any practical knowledge of the profession he intends to follow, is a dangerous type to produce.

He is apt to think on the conclusion of his college course that he is qualified to occupy the higher posts and even to pose as a consulting engineer. Unfortunately public opinion in India does not even yet discriminate between the practical man and the newly fledged theoretical college student, consequently there is a tendency to put immature college trained lads into posts where a practical man is needed; this is fair to neither. Students too on

the completion of their college training, in their pride of intellect, expect employment in the office chair of a man who directs; they are impatient when it is pointed out to them that they have no practical experience and so little conceive what real practical experience of the profession is that they claim that practical instruction in college workshops and laboratories is an equivalent.

Recently a Bengali student immediately after obtaining his degree and before qualifying for the full college diploma was appointed a director of an industrial concern and actually demanded that the experience he might there acquire should be accepted as an equivalent to the period of practical training prescribed for a civil engineer's diploma.

The university type of man can be trained just as well in India as in Europe and at a smaller per capita cost to Government. Such a man may be sent to England for a period of practical training afterwards to fit him to begin to climb the ladder of his profession. But he must be prepared to go through the drudgery on his return. Englishmen have for years had to undergo long periods of apprenticeship after their university course and these are content to begin at the bottom of the ladder in England. Indians must be prepared to learn their profession just as thoroughly before they are competent to occupy posts of trust, especially those in nascent industries run with other people's money.

It will be quite possible to provide adequate university courses of training in India at probably no greater a cost to the public purse than is now incurred.

We have four engineering colleges of university rank: The Thomason College, Roorkee, the Civil Engineering College, Sibpur, the College of Engineering, Madras, and the Engineering College, Poona. The university classes of these colleges turn out at present only civil engineers.

It should be possible to retain college one for civil engineering only and convert the others into mechanical and electrical engineering colleges and into mining colleges where facilities could be offered for advanced courses of a university type.

These colleges all possess professors of mechanical and electrical engineering and have good equipment; by "pooling" the existing resources and by adopting a system of federation amongst these colleges we should be able to institute advanced university courses without any further charge on the public funds.

The colleges should be put under an Imperial Department as they will each have an Imperial outlook instead of their present provincial point of view.

The courses of instruction should be laid down by a Board of Control. The first 2 year courses may be given at all the colleges. After passing an examination held at the end of that period, students should be able to go to one college for a special course in civil engineering, to another for mining, to a third for mechanical and electrical engineering. It would be easy to add on a special extra course in, say municipal and sanitary engineering open to the whole of India.

The colleges would for the present retain their recruiting areas — Sibpur for Bengal, Assam, Burma and Bihar and Orissa; Roorkee for the United Provinces, the Punjab; Bombay for Bombay and the Central Provinces; Madras for Madras.

It would be easy for Burma to obtain the full benefit of such a scheme by starting at Insein or elsewhere a college offering merely the first 2 years of the prescribed course common to all the branches of engineering; the cost would be trifling. The larger independent States too might make similar arrangements.

Under the present conditions each province is expected to make its own arrangement for all higher training, either in the province or by arrangement with another province or by scholarships to England—a very unsatisfactory state of affairs that puts the maximum of obstacles in the way of an enterprising student.

If the engineering colleges were placed under an Imperial Department far greater use could be made of them as centres for higher industrial training. Compare the Forest Institute at Dehra Dun.

They will each be well equipped with workshops and laboratories and with a highly skilled staff. Special industrial courses offered would be open in the natural course of events to the whole of India. Each college would know exactly what each other college was doing (at present they do not) and each college would become a natural advertising agent for all the engineering and industrial courses wherever offered. People would have a ready means of informing themselves in regard to all courses.

I have no experience of industry other than that concerned with industrial education. I believe that it is advisable that there should be some sort of co-ordination of effort between the provinces. Industrial education.

I do not believe that Provincial Governments keep themselves fully informed of the experiments in the way of industrial education that are being made by other provinces.

For instance there is in my opinion room for a dyeing class in India. Bengal made the effort. So far as other provinces were concerned there was no attempt at co-operation.

Though dyes are I believe needed in greater numbers in Bombay and Madras, those Governments did nothing practical in the way of supporting the Bengal classes and it is quite conceivable that they would rather initiate classes of their own, than support those

in Bengal. They could have offered scholarships to enable lads to attend the Bengal classes. The experience gained in Bengal through these classes is practically lost to India.

As the provincial outlook is limited to the province and the provinces have no official right to concern themselves with the needs of other provinces some co-ordinating authority is needed to see that small classes of this nature have a fair chance and are not unduly multiplied. If a Provincial Government puts forward a scheme for a class that would have better chances of success elsewhere, they should not be allowed to start it but some one should see that they give assistance to a similar class started elsewhere.

To allow too many similar classes to be started is unwise; it means that each may be unsuccessful when one class would be a success; but that class should be opened to all India.

There is a danger of a Provincial Government taking a too provincial view where an Imperial outlook is needed; for instance, shortly after a question was asked in the House of Commons regarding the existence of facilities for mining instruction in India, the Government of India addressed the Government of Bengal on the question.

Schemes for mining classes were sanctioned at the Sibpur College and I was granted permission to tour round India with a view to finding out how admission to these classes could best be arranged of lads from other parts. On my return I submitted a scheme, and in sanctioning it I was told that I must not admit any outside student to the exclusion of a Bengali. This effectually prevented any being taken from outside Bengal. I could not know till the actual last day of admission if I would have a vacancy and then it is too late to correspond. Besides one must be prepared to give a definite yes or no to distant students or firms; one can't keep them on tenterhooks. It would be as easy to run an Imperial School of Mines as it is to run the Imperial Forest College at Dehra Dun.

Industries must be run locally and with them goes artisan education.

Higher industrial education may be run imperially and associated with research.

It does not do to divorce education entirely from research. If you cannot associate a professor with the practice of his profession as in medicine, you must allow him to keep his intellect alive with research.

ORAL EVIDENCE, 7TH DECEMBER 1916.

President.—Q. About this scheme of yours for an Imperial technological college, could you give us an idea of the subjects you would take there specially, or if you would propose a separate one for mining another for civil engineering, and one for other groups of engineering?

—A. Before the Public Services Commission I was asked exactly the same question, and I replied, one general technical university embracing all branches of engineering would be ideal, but I thought it would hardly be within the range of practical politics, and they suggested that we might proceed with some sort of scheme of federation of the existing engineering colleges. We might retain our present engineering colleges, with our present recruiting areas; then have the first two years of instruction common to all branches of engineering. After the student has passed his examination tests at the end of that period, he should be allowed to proceed either to one college to specialise in civil engineering or electrical or mining. My idea is that a scheme of that sort could be introduced with very little cost, but I would far prefer to have one general technical university embracing all branches of engineering, which would prevent any college getting at all narrow.

Q. You would have something like the Imperial College of Science and Technology?—

A. Yes.

Q. What standard of admission would you adopt?—A. I should adopt the Intermediate Science standard of the Calcutta University. You cannot adopt a very rigid standard of admission in India because we have to consider both the admission of Indians and of Europeans, and there are so many various standards that you have got to take into account when making admissions, that it is rather difficult to lay down any special standard. You have to teach at the engineering college a good many subjects that you perhaps have not to teach in engineering colleges in England. You have to teach drawing from the very elements. The majority of students who are supposed to know something of science have not even handled a test tube, and have not had any practical test in science at the intermediate examination of the Calcutta University.

Q. Indirectly would that have the effect of modifying the standard adopted for the intermediate science examination in India?—A. No, the trouble is, if you take the Sibpur College as we are now; my present recruiting area for university education is Assam, Bengal, Burma and Behar and Orissa. Any student of these provinces who wishes to be trained for an assistant engineer's post in the Public Works Department, has to come to Sibpur, i.e., there is one engineering college for 100 million inhabitants. I don't know how many arts and science colleges there may be in that particular area. The recruiting area is so great and the number of admissions so small—about 24 every year—that it will be impossible for every college to set up a proper training class for admission here, and you have therefore to take the standards as you find them.

Q. Supposing it was one compound technical institution, would you allow it to have power to grant its own degree?—A. Certainly.

Q. Would you prefer degrees or diplomas of the college?—A. A degree would more probably attract a certain type of student. A college diploma—if it gives the authorities of the college a greater amount of control over the course of instruction and examination—is more preferable to a degree.

Q. Taking into account the fact that the atmosphere of industry is valuable to the student, would it pay to have a separate school of mining, apart from that big technological college?—A. Well, I think it would. The other day we were having a meeting of the Mining Education Advisory Board, and we asked one of our mining representatives what number of men, as assistant managers, he thought would be absorbed every year. He told me about 40 to 60 if the coal-fields are fully developed and the requirements of the Mines Act as to certificated managers fully met. If we assume that half of those were to be college-trained men and the other half practical men, who had trained in the mines, the organised college to turn out about 30 diploma holders here would be a very big thing. You would have to admit 75 or 80 the first year to start with. There would be ample scope for two institutions, one of the university type and one of the practical type run by the mine and acting as feeders or independently.

Q. Assuming that there is justification for setting up an independent institution for mining, are there any sub-divisions of engineering that might be split off in this way for independent treatment, especially having regard to the fact that you would then get an industrial atmosphere which would be conducive to good teaching? Mechanical, electrical and civil engineering?—A. It is much easier to get a proper atmosphere for electrical than for civil engineering. All the machinery may be concentrated within the four walls of a building. In civil engineering our examples must be sought for all over the face of the country.

Q. Would this institution have any dealings with pure science, or rather would it treat pure science as equivalent to a form of technology in its professorial staff and its facilities for research work?—A. If we could get the students who had a sound training in science to start with, there would be no necessity to duplicate training, but at the present time at Sibpur, although we get students who pass the intermediate science examination of the Calcutta University, from the very fact of his having had no laboratory work at all in science, we have to cover a considerable portion of the ground before they are of much use to us. It is rather difficult to imagine what might be the condition in future.

Q. Would it not be better then to make this practically a post-graduate institution and admit no one except those who have passed the B. Sc. degree or an independent examination set up as a test?—A. My experience of Sibpur is this. I have admitted 25 to 30 students who have been B. Sc.'s and those students have a better grip of science than I. Sc.'s. From a student's point of view, the Bachelor course in science lasts 4 years after the matriculation; and to have to put in another 4 years to complete the course in Bachelor of Engineering course is rather a long time. That is the real trouble.

Q. The man who would go through this college would either be fit for nothing, or fit for the best post. Surely if the training is worth anything it should be worth a higher class appointment in the Public Works Department or among firms?—A. I am not quite certain, students who come at the B. Sc. stage are more or less played out, it would be better to catch them at an earlier stage. B. Sc.'s have got more into a definite groove than I. Sc.'s, but if we could give the science training a more practical trend and introduce laboratory training from the very start at Science colleges and insist upon a really good course of science, it would simplify matters.

Q. Could you take them in the earlier stages and give them 5 years' training instead of three? Are you contemplating the practical training to follow, or to come in between?—A. I would like it to come in between the elementary and advanced stages. I think you could give it in 5 years; you could turn out a very good article in 5 years.

Q. You don't turn out a doctor in less than 5 years, why an engineer or an industrial chemist?—A. When I was in America, Colleges were saying they wished they could have their students for 5 years.

Q. Under the British law no one is allowed to practice medicine under 5 years' training, yet they have established B. Sc. degrees with a 3 years' course. Do you think there is any hope of turning out a good technical man under 5 years?—A. I don't think really there is. I think 5 years is a short course to turn out a good man.

Q. Would you then prefer the technological institute to adopt your intermediate standard as an entrance test, followed by a 5 years' course, one year of which at least should consist of practical training in a workshop; do you think that would produce good men?—A. That is what we have now. I have a 5 years' course at Sibpur, 4 years' for the B. E. followed by one year's practical training, and I would like to increase the time beyond 4 years.

Q. Your work is diluted to some extent by several other kinds of classes and also your choice is limited to the one province, or at any rate to the Eastern provinces, so that your field of choice in candidates for admission is small. The prospects offered to the man afterwards are limited, and your training of the higher class man is diluted by the training of other classes. Do you expect success under those circumstances?—A. No, we don't, we are turning out more B. Es. than the country can absorb.

Q. You recollect the classes that were established for evening work on the coal fields under Mr. Griffiths somewhere about 1906. According to the figures that I have seen, of those who have passed the examinations for mine managers'

certificates; most of these men have been trained in evening classes. The next largest group came from Sibpur, and last of all about 2 or 3 out of the 18 scholars who were sent with State scholarships to Europe. Do you think that an increase in evening classes would do as much good as a mining class in Sibpur?—A. I don't see how you could substitute a mining class. The point that I see is that it is a matter of recruiting students to be trained. Students will come very readily to the college, and parents will allow boys to come to a college where they are looked after. It is very easy for me to recruit any number of students every year. It would be far easier for them to come to me than for any of them to make arrangements with individual mine managers.

Q. You serve supplementary purposes?—A. Yes.

Q. Your men when they leave college, do they readily get posts as assistant managers?—A. They are snapped up before their training is finished. Last year we had more applications than we could deal with.

Q. Do they get good pay?—A. After they get the manager's certificate they do very well. They begin on Rs. 150.

Q. How soon after they leave you do they get their certificate, as a rule?—A. Nominally one year, practically one year and eight months. At the last examination I think 80 per cent. of the successful men were from Sibpur.

Hon'ble Pandit M. M. Malaviya.—Q. Having regard to the distances of the different provinces, do you think that one central institution for imparting higher training in engineering would be sufficient for the whole country?—A. As a start.

Q. Don't you think that each major province, such as Bengal, Burma, Madras, Bombay, the United Provinces and the Punjab, is large enough to require provision for the highest kind of engineering education within its own area?—A. Not in all branches! I have the greatest difficulty in getting suitable employment for the 13 E.E.'s I turn out every year.

Q. You know the practice of Roorkee; they have a larger number of students?—A. Their position is entirely different. The Roorkee College is bolstered up with guarantees.

Q. There are only six appointments guaranteed?—A. Six out of 20 admissions means that in the final class there may be 10 or 12. Practically every boy who passes there either will get immediately an appointment as assistant engineer, or be employed by somebody in a similar position. Sibpur passes out an average of 13 every year, for only one guaranteed post. The remainder look for positions elsewhere and generally to the overseer grade of the Public Works Department. They are not trained to be overseers; they are trained to be masters.

Q. What salary do they get in the overseer grade?—A. Rs. 100 to 120.

Q. What is their salary when they find employment under the District Board?—A. They begin at Rs. 60 or 80.

Q. How many of your students rise to be executive engineers; do any?—A. Yes, I could not say what percentage exactly, but we have this one guaranteed post every year in the Public Works Department, and in course of years everyone of those boys has a chance of rising to be an executive engineer. It only means sticking to their work. I want you to understand, if you are thinking of comparing Sibpur with Roorkee, that at Sibpur we did not start till 1880, and it is not fair to make the comparison. If we had started at the same time as Roorkee, you probably would not hear so much about Roorkee. They got their privileged position straight away, and we are trying to compete with them.

Q. So far as the standard is concerned, your standard is not lower?—A. It is higher, and I have a better qualified teaching staff.

Q. I understand that you began the other branches of engineering, electrical and mechanical, only two years ago?—A. We have been teaching electrical engineering for about sixteen years or eighteen years, but we were then teaching a general class sort of engineering. As you saw, the workshops form the backbone of our training, and we were then training a general engineer who was both civil and mechanical. After he finished his college course we gave him a special training in our Electrical Department, we have a considerable reputation for our electrical engineers, and have no trouble in getting employment for them.

Q. How does your standard now compare with the standard of the Imperial College of Science and Technology at South Kensington?—A. Ours is more specially for India, and I should say that they are higher than we are. They must be higher. We are not trying to give a very high theoretical training; we are trying to turn out practical men who will be useful supervisors. Our aim is somewhat different to that of the College of Science and Technology.

Q. You do not aim as high as they do?—A. Not in theory.

Q. You don't think there will be any difficulty in raising your standard to that of the Imperial College at South Kensington? It is only a question of employing more staff?—A. And we would probably have to modify the course and give a higher training in mathematics.

Q. Do you think that one institute will be sufficient to meet the requirements of higher education for the whole country?—A. Of the type of education we have in the Imperial College.

Department you can have one in each of the provinces, but of the university type one would be quite sufficient for many a year.

Q. You do not then advocate the abolition of the colleges that exist, but you want something better to crown them?—A. Yes. You will have to abolish the university classes as they exist, but we ought to have courses everywhere of the upper subordinate type training practical men. The university classes will have to be closed and centralised somewhere.

Q. Is it not wrong for an institute to have lower classes attached to higher classes?—A. It is much better not.

Q. What does the lower subordinate sub-overseer get?—A. The salary ranges from Rs. 35 per month to about Rs. 80, but you find the District Boards and municipalities have men whom they call overseers to whom they offer as little as Rs. 15 per month.

Q. Don't you think that that accounts for the fact that you don't get many students for the classes—the low emoluments?—A. It is only a two-years' course of training to qualify as sub-overseers.

Q. The students can probably earn as much without going through that course?—A. I don't know; I have been told that the value of my sub-overseer's certificate in the marriage market in Bengal equals that of the M. A., so it appears it must be attractive to them.

Q. I would not rely very much on that information. If you separate the school of mines from the technological institute would there not be a danger of your not attracting higher class students to the school of mines, whereas if you had a school of mines as part of the technological institute, are you not likely to attract a better type, the university type of students?—A. It would be some years before you actually started your special training of mining engineers. My opinion is that it is best to let matters evolve. I don't believe in a pure university course of theoretical training, which gives the student an inflated idea of his own knowledge.

Q. Could you not secure that by arranging your courses better, by insisting upon a portion of the time being spent in mines, and a portion in college?—A. We hope to do that, but directly you begin to associate any part of the institute with the workshops, or with mines, it is almost impossible to allow the university to control it.

Q. Supposing the proposed technological institute controls it?—A. Then so long as it is separate from any form of education, art, science, medicine or law; then you could do something.

Q. You have said that there is danger if you delay admitting students to your technological college; they might be played out by that time and may not be able to bring robust minds to the study of the different subjects?—A. Yes.

Q. You say that you attribute the failure of affiliated schools entirely to the want of industries in Bengal and to the desire of Bengali parents to obtain service for their sons with prospects of a pension?—A. Yes.

Q. But the number of appointments which carry a pension are limited, are they not?—A. Yes, but if you cross-question any student in class you will find that his guardian is looking for service for him either under Government or the District Board or the municipality.

Q. But they must very soon discover that not a quarter of them get such employment?—A. That particular batch will, but the batch of the following year won't know anything about it.

Q. Don't you think that parents are beginning to find out that they cannot obtain such appointments for all their sons?—A. They are beginning to find out.

Q. Don't you ascribe the desire of Bengali parents to look for service for their sons under Government or District or Municipal Boards partly to the absence of suitable instruction in technological institutions? That used to be the case in Germany between 1830 and 1840. If a man had 12 sons he would like his twelve sons to go in for Government employment, but all that has been changed since a system of technical education was instituted to provide new openings for them?—A. I regard it more as a question of employment than of an actual course of training. I don't think any guardian has any opinion of the course of training which his son is going through. He would be just as pleased with a bad form as a good form.

Q. In view of the industries—chemical industries, jute and paper industries, etc.—that exist at present, don't you think that there is enough room for employment for young men who may receive proper education and training in technology?—A. I thought you were alluding to the civil engineering side. These technical schools will train only for sub-overseers.

Q. You say that the Bengali student has a tendency more towards philosophy and the abstract ideas found in law. Don't you find that he delights to receive the technical instruction which he is receiving, for instance, in your college, and that he takes to it quite as eagerly as is philosophy or law?—A. When you have once wakened him up and made him take a proper standpoint with regard to training, he is as keen as anybody.

Q. You have had a number of B.Sc. students; did you find in their case that they were not sufficiently keen?—A. They are not so keen as the I.Sc. He is more ready to take to the workshop training than the older men. It is only a difference of two years, or may be three years.

Q. And you find that two years make a great deal of difference in the attitude of the men towards the workshops?—A. Yes, but you must also take into account that the larger proportion of the B.Sc. men are married than the I.Sc. That must affect it somewhat.

Q. You say that the B.Sc. who go to you don't show the same willingness to benefit by practical training as the I.Sc. do?—A. They are very much better in the chemical or physical laboratory, but they are a little bit impatient over work in the carpenter's or blacksmith's shop, regarding it as drudgery. They don't see the benefit of it.

Q. Their higher knowledge of mathematics would be of greater help to them?—A. They are better students as far as passing examinations is concerned.

Q. You put them through a practical course for one year after they have passed their examinations; is that not sufficient to make up the deficiency in regard to practical work?—A. No; what is one year compared to five years. That is demanded in England after a university degree before they can get practical work. Here they expect me to turn out practical engineers after one year's training. In the last 12 years no B.Sc. has won the guaranteed Assistant Engineer's post.

Q. He has not to spend five years in apprenticeship without payment. Has he?—A. They do in England. You have to pay for it the whole time, but he should be able to arrange to get suitable wages.

Q. That is only to qualify him to rise by practical experience?—A. You begin at the foot of the ladder after having done that.

Q. Do you find that these B.Sc.'s are very much addicted to "by-hearting" methods, as you describe them?—A. I think they probably do not find it so necessary to do so now.

Q. You say here, "I do not think that most Bengali lads approve of these methods of instruction, especially those that join us after passing the intermediate in arts or science examinations and are more fixed on their "by-hearting" methods. Does that apply to the case of those that join you after passing the intermediate science?—A. I was more comparing the matriculation stage with the intermediate science. In the apprentice department I admit students in the matriculation stage, and in the engineering in the I.Sc. Those in the matriculation stage take more kindly to workshop instruction than the older students.

Q. In view of this opinion do you think that if drawing were insisted upon earlier in the school course, and students received a good education in elementary physics and chemistry before they passed their matriculation examination, a five years' course after that—if the course for the matriculation was modified—would suffice for the engineering degree?—A. So much depends upon the method of examination and the standard adopted by the examiners.

Q. You don't insist upon a high degree of qualification in the English language for the engineering standard; what you want is a knowledge of mathematics, physics, chemistry, and a good knowledge of drawing?—A. Yes.

Q. So if you had a modified system of the school course, in which these subjects received proper attention, then in your opinion a five years' course in engineering would be sufficient?—A. I would not prescribe it for a man who is going to take a university course, because he ought to have some training in literature as well, but for a man who is going to be a supervisor, specialising would be an advantage.

Q. For a man who is to rise to the top, you want a more liberal education?—A. Yes. After my students leave college and mix with deputy magistrates and other people who have had a more liberal education, they don't shine; their English is a bit faulty; they are under certain social disadvantages, because of their want of knowledge of those general subjects which might enable them to meet these officers as equals.

Q. You think that for those who aspire to higher engineering appointments and examinations for university degrees, this is very desirable?—A. As things are in Bengal, I think it is simply because the ordinary curriculum both in school and college is so peculiar. The student goes to school and takes the minimum number of subjects, whereas in England you take the maximum number. If four subjects are required, you appear in four; in England you appear in eight. The same in the college courses, they take the minimum number and the whole outlook of the student is narrow, because of his narrow education.

Q. Suppose you were to take up only the B.Sc.'s. Do you think, in view of the knowledge of mathematics, physics and chemistry, which they possess, a three years' course would give them all the theoretical knowledge they require of engineering?—A. I am admitting B.Sc.'s now.

Q. In their case, could the course you are putting them through now be covered in three years?—A. No, but if they had a real working knowledge of drawing and of mathematics; if they had mastered their subjects and not only obtained 33 per cent. of marks, and have only read the easy parts of the syllabus and not the difficult parts.

Q. Supposing they had taken honours?—A. That is a different matter; then they could go through the course in three years.

Q. You say, "The university type of man can be trained just as well in India as in Europe." What do you mean?—A. I think if you turn out too many of that class of men who find it difficult to get employment, you would only be adding to discontent in the country. We are now

turning out far too many civil engineers in Sibpur. What is the result? All these students who go into the overseer grade are entirely discontented. Perhaps a school-mate has become an assistant engineer and they look with jealousy at him.

Q. That is because their emoluments are not sufficiently good?—A. No, it is a matter of position. There is no demand for them in the country. They are occupying the post of overseer to the exclusion of the overseers for whom I have got another training class.

Q. That would apply to numbers put through the college, not to the qualifications of the men admitted; for instance you have said that the B.Sc. is a better student in all theoretical knowledge than the non-Bachelor; supposing you restricted the number to B.Sc.'s, then he would not be a dangerous type?—A. If you restricted the number that can be readily absorbed by industries, it would be a good thing to do.

Q. Then you are probably inclined to modify this sentence of yours?—A. I daresay I would. I am only looking at it from the point of view of want of employment, and nothing else.

Hon'ble Sir R. N. Mookerjee.—Q. You complain that you don't get the best type of students in the engineering profession; don't you think that the difference in the grades of the appointments, Imperial and Provincial, has something to do with it?—A. Yes, it certainly would have.

Q. In your experience, coming in contact with these engineers who come out from England under Imperial appointments and those sent out by your college, do you find much difference in their education?—A. I have not got the same intimate knowledge of men who come out from England. I only judge from my own case. The course of training we put our students through is a thorough course of training.

Q. In reply to the Pandit you said that you considered that the standard and quality of teaching, both practical and theoretical, in Sibpur is, if anything, superior to Roorkee College; can you say that with reference to the colleges at Madras and Poona?—A. I made more visits to Roorkee than to Madras and Poona. I think we have a stronger professorial staff and better equipment and facilities for training.

Q. Do you think the system of guarantees has anything to do with not getting a better class?—A. It makes the Roorkee College very much more attractive than the Sibpur College, and it is probable that you will find a better class of student at Roorkee. Their fees are very much higher than at Sibpur, and they are probably drawn from a different grade of society.

Q. Do you attach any real value to your connection with the Calcutta University; is it advantageous to your college or disadvantageous?—A. I don't see any real advantage in the connection. The connection is only valuable to me from the point of view of what you would call "window dressing."

Q. How much time have you, as Principal, to give to university meetings?—A. For the last fourteen years or so I have given up practically every Saturday to university work, and it is a very heavy drain on my energies. It would be much better if I could spend that time in keeping in touch with the future employment of my students.

Q. You replied to the Pandit that practical training is not recognised by the university, and that is one of the reasons why B. Sc.'s don't care for practical training; taking that into consideration, if your college were separated from the university it would be better for all concerned?—A. I think so. I may say especially with reference to the last question you asked me, I would judge that about one-quarter of one per cent. of the business I am called into Calcutta to discuss has relation to engineering. My time is absolutely wasted in the university.

President.—Q. Do you get any advice of value from the university?—A. No.

Q. You have a governing body; do you get more or better advice from your governing body than you do from the university?—A. I get much better advice from the governing body. All practical questions I take to them.

Q. So far as actual efficiency is concerned, it would be better for you to cut your connection with the university?—A. Yes, I find it is merely a body of examiners; there is no university life.

Q. What about the hall-mark that is stamped on your students; is that of any market value to you?—A. It helps to attract students to the college, and at the present time it has an exaggerated value in the eyes of employers.

Q. So long as an employer can be taken in in this way, it would be an advantage to be connected with the university; is that the conclusion?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. You say that commercial firms engage them because they are B.Sc.'s or M.Sc.'s?—A. I don't think they do.

Q. Then does Government alone stipulate for certain theoretical qualifications besides practical experience?—A. Certain theoretical qualifications are always laid down quite apart from practical experience.

Q. Can you give us an idea of the cost of giving higher engineering education to students per head?—A. No, I cannot answer that question, but I have got one or two points, and that is with reference to the question of the cost of education at Sibpur. The college costs

Government about 2 lakhs out-of-pocket every year, excluding all interest on capital investments and all pension charges. The tuition fees in the engineering department are Rs. 120 yearly for the first two years and Rs. 180 yearly for the second two years. Against that 63 per cent. of my students have scholarships or are receiving assistance in some way or another, 80 per cent. of the money is returned to the student in the shape of scholarships. In the apprentice department, where we have mining courses, the tuition fees are only Rs. 36 yearly, and 85 per cent. of my students receive assistance in the way of scholarships or reduction of fees, including 40 Indian students who are received on inclusive fees, i.e., tuition, board and lodging at Rs. 3 per month, 25 Anglo-Indian apprentices who pay Rs. 6, and 25 who are free. From that department we return the students in one form or other four times what we collect in tuition fees. This is for the whole department. I have not got separate figures for mining, etc. In the whole department I return to the students four times what I take from them in tuition fees.

Hon'ble Pandit M. M. Malaviya.—Q. In what shape?—A. Lodging, reduction in fees, etc.

Hon'ble Sir R. N. Mookerjee.—Q. In your system of education, you don't have any lectures as to how to keep accounts?—A. No, we have no lectures on accounts of any description.

Q. Would it be a very difficult problem?—A. No, it could be very easily arranged. I think it would be a very good thing to introduce if our boys are going afterwards to help in starting industries, they ought to know something about it.

Dr. E. Hopkinson.—Q. Has the Board of Faculties of the University any control?—A. They are supposed to inspect the college once a year, and if they consider that the facilities for teaching are not up to the mark, they can disaffiliate the college.

Q. Then the controlling body is what you would describe as a governing body?—A. There is a governing body of 9 to whom the Government give a grant of nearly fifty thousand rupees a year for contingent expenses like the purchase of apparatus for the practical training of students, laboratory, etc. All questions of the employment of the staff, construction of new buildings, etc., go to the governing body. It is appointed every year by Government for that particular purpose.

Q. In all matters of curriculum you have a free hand?—A. No, with reference to the university courses they have to be approved by the university, and then the university sends them up to the Government of India who eventually sanctions them. With reference to the other courses, since we have two other institutions, one at Bankipur and one at Dacca, the Joint Technical Board advise us with reference to the syllabus.

Q. Take the experiment you refer to, viz., the dyeing school; to whom did the proposals you put forward go?—A. Those were sent to the Director of Public Instruction. There was no governing body at that time.

Q. It would not go before the university?—A. No, it is not a university question.

Q. You attribute the failure of those classes to the fact that there was no cotton in Bengal to be dyed or bleached. Do you think that was the sole reason for the class, not being a success?—A. We have not turned out many students; perhaps eight or ten students only since the class was started, and the majority of those have not followed the subject of dyeing. One is employed at Kalimati.

Q. What constituted the failure? Did you fail to get students?—A. Yes, the fact being that there was no employment for students after they were trained. There was a great demand for the artisan classes. When I found that the other classes were failing I asked Government if they would allow me to divert some of the scholarships to the training of artisans and the artisan classes have always been full. In the dyeing department we gave free education and a scholarship of Rs. 14 per month, which would practically support the boy in college, except for the purchase of his books. Even that would not attract the students. We also gave a diploma in the principles and practice of dyeing and bleaching.

Q. How is it that it was suggested that if the university offered the B. Sc. degree, the class would have been a success?—A. More students would have been attracted, simply on account of the B. Sc. degree, and because they would be supported for 2 or 3 years without expense to their guardians.

Q. That would not alter the scholarships that they might be able to obtain?—A. Every student joining the dyeing classes was given a scholarship.

Q. Whether reading for a degree or not?—A. Yes. He would also imagine that the B.Sc. in dyeing would give him a great claim on Government for employment afterwards either in teaching or otherwise. He would say that he had been deluded into joining the class by me when there was no possibility of getting employment afterwards.

Q. The only appointment he would be likely to obtain would be in connection with bleaching or dyeing; how does the question of the B.Sc. degree make any difference in that respect?—A. It would not to the practical man, but to the student who would be attracted to the college. He would be very much attracted by the possibility of getting the B.Sc., especially as he would be getting the B.Sc. cheaply.

Q. Would the B.Sc. in dyeing imagine that some position in dyeing would be created for him?—A. He would probably conceal the fact afterwards that he was a B.Sc. in dyeing, and say that he was a B.Sc. only.

Q. What then? Assuming that he successfully concealed the fact, that he knew something about dyeing, what would be his fate then?—**A.** There would be no employment open for him.

Q. He thinks he would be better off: why does he think so?—**A.** There is a general hunt for degrees in Bengal. They are very popular. I had an application from a teacher in the Central Provinces, who said he wanted to join the dyeing classes. When I cross-questioned him for reasons, he said it would improve his value as a teacher. He was already in employment but wanted to get a degree in dyeing.

Q. Are those who hold the B.Sc. degree engaged mostly in teaching; is that how they find employment?—**A.** I am afraid I don't know, not having sufficient knowledge of the university side.

Q. Do you differentiate between those who obtain the B.Sc. degree and those who do not, but hold a certificate?—**A.** The B.Sc. would be of greater value from the teaching point of view.

Q. You mean in obtaining a teaching appointment?—**A.** I think so. But at the present moment certificates are of value because there are not many in the market. The students place value upon these certificates. I know of an instance where boys who have passed the sub-overseer's examination have joined a course for the training of Sanitary Inspectors without any intention whatever of following the profession afterwards, but they considered that it added to their prestige to have a number of qualifications.

Q. You said that the total cost of running the college was 2 lakhs?—**A.** 2 lakhs annually, excluding interest on capital and pension charges.

Q. You said that the amount returned to students was four times the amount of their fees?—**A.** Tuition fees; they also pay other fees for boarding, etc.

Q. The total figure with regard to tuition fees; how much does this come to?—**A.** The tuition fee in one department is Rs. 120 yearly for the first two years; and Rs. 180 for the second two years.

Hon'ble Pandit M. M. Malaviya.—**Q.** Do you charge for 10 months or 12 months?—**A.** We used to charge for 12 months but now they pay 8 instalments instead of 12. In the engineering department in the year 1914-15 the total received from students in the shape of fees is Rs. 14,521. The scholarships and stipends paid to students were Rs. 9,639, i.e., the fees exceeded the scholarships by Rs. 4,883, for an average of 92 students, the average attendance during the year. In the other departments the fees collected amounted to Rs. 3,365 and the scholarships and stipends to Rs. 15,679. The scholarships exceeded the fees by Rs. 12,314. In the apprentice department the average number of students was 166. The number varies from month to months.

Mr. A. Chatterton.—**Q.** Do you know the kind of training that is given to boys going to the Osborne Naval College at home?—**A.** I know that class of teaching.

Q. I gather from the examination going on this afternoon that you are not at all satisfied with the previous training that the students have received before they come into the engineering college, and you admit boys at present who have passed the intermediate examination or a higher examination. They go through certain course of instruction in the engineering college, and finally take a degree at the university. I also gather that you are not at all averse to disassociating the college from the university?—**A.** Quite so.

Q. Would it be practical to take boys into the engineering college for the engineering classes at a very much earlier age than is done at the present time, and to give them an education in the engineering college which would embrace not only the ordinary engineering subjects now taught, but also include some amount of suitable English and mathematics and anything else necessary to give them a fairly liberal education to hold their own with other Government officers afterwards: would it not be practicable to take in boys of the age of 16, and cut them off altogether from the university system of the country?—**A.** I don't think so; the university system has far too great a hold in Bengal.

Q. That is the very reason, if we had an Imperial college established on these lines, we should probably be able to draw students into the engineering college from a different strata of society altogether?—**A.** Against that we must remember that there is only one engineering college in Bengal, and it would be rather rough on the province if you force everybody to come in at an earlier stage. A great many parents have not made up their minds about the profession they want their boys to follow, and it is right that he should continue his general studies until he is about 18, when his parents would know better what his bent is, we could do better with him, if he joined at that age. My point is that at the present time the Bengali guardian keeps his boy in what he calls "the general line" as long as he possibly can. He cannot see at the age of 14 what the trend of his mind is; he does not know whether his inclinations will lie towards doctoring, engineering or anything else, and I don't think, from the educational point of view, that he would be able to specialise at such an early age. I don't think it would be a sound proposal.

Q. Of these students who go into your engineering college, what percentage become officers in the Public Works Department or the various branches of the engineering service in the country, or are masters in private work?—**A.** I have not got any exact figures by me, but speaking generally the number is between 35 to 40 per cent.

Q. That is to say, you are training practically three students to get one officer, and the other two-thirds go into the subordinate ranks of various services, and naturally they are

discontented all their lives?—A. Yes, it produces discontent in other classes as well as in their own.

Q. Are the prospects the same in all those engineering colleges?—A. Not in Roorkee. Every man who passes out of the engineering classes gets an officer's appointment. Although they have six or seven guaranteed posts in their assistant engineer's grade. When you come to the upper subordinate class, they have 15 upper subordinate posts guaranteed to my one.

Q. The training which you give to the engineering class is not exactly suited to produce what you call a first class upper subordinate?—A. No.

Q. So that to get this comparatively small number of officers you are giving a bad training to men who would otherwise make good upper subordinates?—A. That is so.

Q. Then if a central engineering college were established it would not be necessary to make the classes so large as they are at present?—A. No, it would not. There is one point which I think we are just coming to, and that is that owing to our present organisation of these engineering colleges—I am speaking more especially of Sibpur where we have the upper and lower subordinates all being trained together, and all joining the same mess—it makes the gentlemen who are capitalists, and to whom we may look to promote the industrial development of the country, very chary of sending their sons to the college at Sibpur. I cannot give them accommodation of the sort that they have been accustomed to have at home, and from that point of view I think you may say we are not properly organised.

Q. Don't you think that we should get a better class of engineer in this country, if we recruited them from a higher strata?—A. I think our drawing from a better social strata is more likely to produce a better officer, people who are accustomed to the handling of money.

Q. People of that class don't pay so much attention to a university education as is the case when students are drawn from the poorer classes. Would it not be advisable to take the boys at an earlier age and give them a thorough education, such as I have mentioned is given in Osborne rather than continue on the present system. It would mean a bigger staff but the results may be well worth it. You would teach them all the science they have got to learn in this college; they would begin with mathematics, English and drawing, and the course of instruction would be much longer if you brought them in at 16 and turned them out at 20. The final result would be a more highly trained and more valuable officer, although perhaps we could not afford one such college for each province in India. I suppose that the whole of India could afford to establish an institution on those lines?—A. I am still rather of opinion that you would miss a very large number of excellent people, because their guardians do not realise the necessity of their leaving school at that early age.

Q. What we want people to look at is that education is not necessarily connected with the university. There are other systems by which students can be trained than the system in vogue at the present moment. It is not a question of everybody being able to take it up, but whether there would be a sufficient number who would be willing to do so. We might make a beginning with engineering, and if we found that successful we might develop in other directions. There are peculiar facilities in the training of engineers, because Government would be the largest employer?—A. Certainly, I think you would turn out very much better men in that way. I would however like to consider my reply to that.

Q. You are not prepared to commit yourself to the statement that it would be a better system than the present one?—A. I am not prepared to do that; I think the country would suffer if you had it that way.

Q. In what way?—A. The large number of students who would like to take up engineering and continue their studies in the B.Sc. or I.Sc. class would be excluded. You might say that they are able to go home and get a training elsewhere.

Q. This would not apply to the training of the upper subordinate in the least. The great bulk of your students you say not more than one-third rise to the officers' grade, therefore the great bulk would still be unaffected, whereas we should be able to ascertain clearly were there a better system of education, to what degree of engineering fitness the people are capable of rising?—A. I think if you were to introduce a college of that sort, you would probably find other people trying to start colleges directly affiliated to the university, teaching the present courses. You might make a *corps d'élite* that way. If you have the others started you would soon find that the *corps d'élite* would disappear. Political influence would be brought to bear and the others would try to come in. Cooper's Hill was abolished to give the universities a chance, so this would be abolished in order to give the university in India a chance.

Q. If a college on these lines were established, would it be practicable for private enterprises to start rival engineering colleges; where would they get their staff from?—A. We know very well that they started private medical colleges in Calcutta, in order to meet the demand. They were not fortunately successful from the medical point of view, but they had numbers and numbers of students.

Q. There is a difference between the engineering and the medical profession; there is an enormous demand for qualified or half-qualified medical men; but there is no demand for

half-trained engineering men?—A. When the university lays down a syllabus of instruction, as the Calcutta University has in the B.E. degree, it would be possible for institutions to train students for that degree at a very much less cost than Sibpur by eliminating the workshops which the university ignore.

Q. The University would disaffiliate them, because they were not properly equipped, that is to say if the university performed its functions properly?—A. If the university had capable engineers on their syndicate, they probably would.

Q. I understand it is the duty of the university to inspect your college every year; do they do so?—A. Practically.

Q. Do they formally do so?—A. I have had about three inspections in six years.

Q. Have they raised any questions of inadequate equipment?—A. No, but when you appoint inspectors they have always got to complain about something or other, whether right or wrong.

Q. In such a college as I am suggesting, would they not attach more value to the diploma than to a university degree?—A. They would, because it would ensure them employment afterwards.

Q. In the scheme which you put forward here, you propose the federation of the existing colleges; if that federation is to be of any value it would mean disassociation of the existing colleges from the existing university, and would imply the granting of a diploma by the Board or the Government of India who would be over this federation?—A. Yes.

Q. At what stage, under the present system, do you think you should take your students away from the ordinary channels of education and divert them into special courses for the training up of engineers; what would be the best stage in the present system of education for this?—A. I think the intermediate science stage. If they continue their education to the B.Sc. stage it would mean that the majority of the students on joining the college would be 21 to 22 years of age. Then the five years course after that would make it 26 or 27 years, presuming that they don't fail to take promotion every year.

Q. I suppose your average boy matriculates at 16 or 17?—A. He cannot before 16.

Q. Well he matriculates between 16 and 18; don't you think it would be practicable either in this federated system of engineering colleges, or a central engineering college, to give better education to the boy who was going to be trained as an engineer during the two years that he is going to spend either in this college or in an ordinary arts college. Would it not be practicable to devise a system of education that would enable him to spend his time better and with much more certainty, since he knows at the earlier stage what was going to be his proper career?—A. It would be quite possible, I think.

Q. There may be many reasons against this on the score of expense or otherwise, but don't you think that on the score of feasibility it would be practicable to get as students a very much more promising class of boys?—A. You would probably have to face this difficulty that in order to get the certainty of admitting, say, 40 boys at the present age, I would probably have to admit 100 boys to that special course of training. You could not bind them all to come to engineering. They would probably want to leave for several reasons. Take the engineering department, I lose about one-quarter of my students during the first year.

Q. That was not my experience in Madras. I don't think we ever lost a student unless he died?—A. In the apprentice department we lose up to 40 per cent.

Q. I don't think it is the experience in other classes where you have this highly specialised course of training that the number that fall out on the way is at all large?—A. In the old days when I admitted 40 to the engineering department, my average output was 13 B. E.'s.

Mr. C. E. Low.—Q. It is certainly the case in the agricultural college that you lose anything up to 50 per cent. during the three years?—A. In the old days many of the students would go away in the first week, because they did not like the work in the workshop.

Mr. A. Chatterton.—That sort of thing would not apply to a high grade of college where the boys are taken at a comparatively early age, and where the social requirements would be of a very much higher class. They would all live in hostels under very careful and close supervision.

Hon'ble M. M. Malaviya.—Q. Are not courses in engineering now ordinarily part of the curriculum at every English University? I mean there is not a Faculty for Engineering in almost every English University?—A. I believe so.

Q. In America there would hardly be a university that would not offer a degree in engineering?—A. No.

Q. So also in Japan. Apart then from the reasons you have given for disassociating the engineering college from the university, a degree in engineering should form part of a university course?—A. In the educational world, perhaps, yes, but you will find that the technical college education is becoming more popular than the university.

Q. Take, for instance, the Imperial College of Science and Technology. It stood a separate institution for many years, but it has now become a constituent of the London University?—A. I don't know.

Q. So that the tendency is to include engineering colleges which stood outside a university in a university. Do you think on the whole that the atmosphere which the students would

find in a university would attract a better type of students, to an engineering college which was affiliated to it than would otherwise be attracted?—A. In my college at Sibpur there is no university atmosphere at all.

Q. If you cut off the lower portion of the institution and raised it to the university standard, do you think then the atmosphere would be better and attract a better class of students?—A. The only value of a university connection is the atmosphere of the other graduate courses, which we don't get.

Q. And that corporate life of students exercises a stimulus and also a moral influence?—A. Yes.

Q. Are you aware that two engineers from the Roorkee College are occupying very high positions in Bengal?—A. Yes.

Q. You have seen many Roorkee men, do you think they are altogether of a higher level than the students whom you turn out under existing conditions?—A. The way I would put it would be this, that they mix more easily in society.

Q. Do you ascribe it to the fact that the students at Roorkee know that they have to work with officers as men of equal standing, or do you ascribe the difference you find in Sibpur to the fact that the students have the idea that only one can obtain an appointment and the rest of them have to work on a very much humbler plane?—A. Yes, and you might add that at Roorkee the university students live entirely separate lives to other students. They have their own mess, where they are expected to live in good style, are expected to dress for dinner, and are prepared for an officer's post, whereas at Sibpur my university students have a joint mess with the sub-overseers and overseers.

Q. Then what is needed to raise the Sibpur Engineering College to a first class engineering college are three things; one the cutting off of the lower class, the sub-overseer's class, the second the giving of an assurance to the students that they will find employment as engineers in the public service, rising up to the executive engineer's grade; and the third the provision of a numerically stronger teaching staff?—A. You cannot give that assurance. At the present time the Bengal Government only take one student from me every other year. Before they cut off Bihar and Orissa, we had double the number I have now. The Bengal Government took one every year; now they take one every alternate year.

Q. If the students had a little better prospect held out to them then many of your difficulties would disappear, so far as attracting a better class of student is concerned?—A. Yes.

Q. You would attract students who would be fit to become first class engineers, to take up executive engineers as the experience of Roorkee shows?—A. Yes, but we would have to alter the living arrangements entirely.

Q. You have said that the fees here are Rs. 120 for the first two years and Rs. 180 for the next two years; what fee has the student to pay in a University in England when he goes in for the engineering department?—A. I don't know what the fee is.

Q. In your college a student has to pay Rs. 600 for the full course, boarding being separate?—A. Yes.

Q. Has he to pay a fee when he goes in for the apprenticeship period of one year?—A. No, he is paid a scholarship then of Rs. 50 a month.

Q. So far as you are aware, do you think that a student has to pay more than Rs. 600 for a degree in engineering in Manchester?—A. I am not quite certain.

President.—The fees in Manchester probably works out to 40 guineas a year, i.e., Rs. 640 yearly. Those are nett fees. There are certain other charges they have to pay of various kinds. It is about Rs. 1,800 for a three-year course.

Hon'ble Pandit M. M. Malaviya.—Q. In view of the average incomes of the people in India and in England, don't you think that Rs. 600 against Rs. 1,800 is not a low fee to pay?—A. If they all paid it, it would be a fair fee but when you return 80 per cent. of the fees, it is very low indeed.

Q. You have stipends and scholarships in England? Have you not?—A. Not to that extent.

Witness subsequently forwarded the following statement:—

Statement showing the careers of former mining students of the Sibpur Engineering College.

Name.	Diploma in mining.	Colliery Manager's certificate.	Position attained.	REMARKS.
1. A. A. Jones .	Passed 1907 .	1st class 1910	General Manager, West Tethuria Colliery.	Fighting in France.
2. E. Kelly .	Passed 1907	...	Surveyor, Nundydrog Mine.	
3. T. Powell .	Passed 1907 .	2nd class 1908 .	Manager, Bajara Colliery.	

Statement showing the careers of former mining students of the Sibpur Engineering College—contd.

Name.	Diploma in mining.	Colliery Manager's certificate.	Position attained.	REMARKS.
4. Abdullah .	Passed 1907	Prospector, Diamond Prospect- ing Company, Punjab.	
5. E. Murphy .	Passed 1908	Assistant Manager, Charanpur Colliery.	
6. P. C. Pandit .	Passed 1908	Assistant Manager, Jamgram Colliery.	
7. E. Milchem .	Passed 1908	V. G. Manager, Jamgram Colliery.	
8. U. N. Mukerji .	Passed 1909	Sub-Divisional Officer (P. W. D.), Suri, Birbhum.	
9. A. E. McGrath .	Failed .	2nd class 1918 .	Assistant Manager, Lodhna Colliery.	
10. G. Bridgwater .	Passed 1908 .	2nd class 1909 .	Manager, Aiyapatra Colliery.	
11. J. H. W. Payne .	Passed 1910 .	1st class 1916 .	Assistant Manager, Deehargarh Colliery.	Gone to the front.
12. S. N. Bhattacharjee	Passed 1908 .	1st class 1912 .	Manager, Khora Ramji's Col- liery.	
13. F. Short .	Failed	Assistant Manager .	In Mesopotam- ia.
14. J. N. Sen .	Failed	
15. W. Powell .	Failed	Assistant Manager, Bhurra Dhemo Colliery.	
16. K. C. Bannerjee .	Failed	Assistant Engineer, Calcutta Improvement Trust.	
17. N. C. Dutt .	Passed 1910	State Geologist, Jeysalmer.	
18. G. A. Hyde .	Passed 1910 .	2nd class 1913 .	Manager, Sitanalla Colliery.	
19. S. M. Chatterjee .	Passed 1910 .	1st class 1914 .	Manager, North Baraker Col- liery.	
20. H. Brown .	Passed 1910	In Rawalpindi.
21. J. N. Bhattacharji	Passed 1910 .	2nd class 1918 .	Manager, Albion Coal Com- pany.	
22. N. G. Roy .	Passed 1911	Contractor, Pabna.	
23. C. C. Chatterji .	Passed 1911	Overseer, Port Commissioner, Calcutta.	
24. D. K. Penfold .	Passed 1911 .	1st class 1916 .	Assistant Manager, South Bullari Colliery.	
25. O. N. Devereux .	Special Course .	1st class 1910 .	Messrs. Burn & Co., Howrah.	
26. A. T. McGuire .	Failed	Gone to England for training.
27. E. Seymour .	Failed	In Burma.
28. N. C. Khan .	Failed	
29. M. D'Crus .	Failed	
30. K. Manna .	Passed 1911	Officiating Director of Mines, H. H. the Nizam's Govern- ment.	
31. B. K. Ganguli .	Passed 1911	Surveyor, Giridih Colliery.	
32. B. M. Bhagat .	Passed 1912 .	2nd class 1913 .	Chief Surveyor, Kenwadih Colliery.	
33. J. C. Das Gupta .	Passed 1912 .	2nd class 1913 .	Manager, Kusumkanali Colliery.	
34. H. C. Das .	Failed .	2nd class 1915 .	Assistant Manager, Sendra Colliery.

66. C. L. Guha	Failed	Assistant, Surveyor, Burma Mines, Ltd.	

WITNESS No. 117.

MR. A. POINTON, *representing—*

- (1) *Kilburn & Co., Managing Agents, India General Navigation and Railway Co., Ltd.,*
- (2) *Macneil & Co., Agents, River Steam Navigation Co., Ltd.,*
- (3) *Andrew Yule & Co., Managing Agents, Bengal-Assam Steamship Co., Ltd.*

WRITTEN EVIDENCE.

2s. Nos. 97 & 100.—We regret we are unable to give you a precise answer to the first portion Waterways of question 97. The province possesses a network of magnificent waterways on which transport facilities have been gradually extended thus greatly assisting industrial development. Transport facilities could be more fully developed on waterways already being used and could be extended to other waterways if the waterways had proper attention.

In countries where transport as a whole has been highly developed it has been recognized "that it is communication which makes traffic and not traffic which makes communication." It therefore behoves the country to look far ahead with regard to her transport facilities in order properly to encourage the development of her industries. By putting the waterways of the country under proper control it would help very materially and economically to increase their value as a transport asset.

In this connection we wish to have the support of your Commission as soon as conveniently possible to the proposal now before Government:—

1. That the waterways of the three Provinces of Bengal, Assam, and Bihar and Orissa should be placed under a permanent staff of Waterway Engineers in the control of a Waterways Trust constituted somewhat on the lines of the Calcutta Port Trust.

In order to give the proposed Trust a solid financial basis it is desirable that sanction should be first obtained from the Secretary of State for carrying out the Grand Trunk Canal and Inland Harbour Projects, which we refer to below. To assist your Commission in considering the proposal we enclose a statement (Statement No. 1) on the subject.

As regards the latter portion of question 97 and question 100 we also wish to have the support of your Commission as soon as possible to the following proposal now before the Government:—

The Grand Trunk Canal

and

Inland Harbour Schemes.

A report with estimates and plans has been made by Mr. Addams-Williams, C.I.E., the Superintending Engineer, South-Western Circle, Bengal, Public Works Department. We are in general agreement with the scheme as set out in the report. This states clearly and convincingly the extent to which the canal and harbour schemes are likely to forward the industrial development of Calcutta and Bengal. Briefly they would provide—

- (a) better terminal facilities;
- (b) many miles of slack water frontage for industrial development; and
- (c) better sanitation.

The report also shows that the projects will fulfil the conditions laid down in the Public Works Department Code and can therefore be classed as productive work and be financed from loan funds.

Mr. A. Pointon will represent us before the Commission. As Mr. Addams-Williams' report is a long one, for the convenience of your Commission a statement (Statement No. 2) has been prepared, more or less in Mr. Addams-Williams' own words, setting forth what appears to be the more important advantages of the Grand Trunk Canal and Inland Harbour Schemes. This statement (Statement No. 2) is being submitted by our representative.

STATEMENT No. 1.

Proposed formation of a Waterways Trust.

For many years the various Chambers of Commerce, the Inland Steamer Companies, etc., have been pressing for a better system of control for the Ganges, Brahmaputra, and Megna group of waterways.

Sir John Woodburn thoroughly appreciated the potentialities of the Bengal waterways and at a meeting of officials and others on the "Rhotas" on the 23rd August, 1902, His Honour decided in connection with the proposed improvement of the Bhagirathi and the canalisation of Tolly's Nullah and Madaripur bhiil that the schemes should be taken as one under some such title as that of the "General Improvement of Bengal Waterways." Sir John Woodburn did not live to see the preliminary estimates of the Tolly's Nullah scheme, as he died in October of the same year.

In 1907 the steamer companies wrote to the Governments of Eastern Bengal and Assam and Bengal asking "if a comprehensive scheme could not be adopted for the improvement of the great waterways of the provinces."

Nothing definite having been arranged, on the 7th June, 1912, the Chamber of Commerce wrote to the Government of Bengal pressing for the formation of a waterways trust.

Witness here gave an extract from the confidential proceedings of the meeting of the Standing Waterways Committee, held on 16th December 1914, to consider the question of the proposed formation of a waterways trust.

Through transfer, employment on special duty, leaves, sickness, and retirements there were the following changes (temporary and permanent) of the officials in charge of irrigation (including waterways) during the 25 years ending 1912, viz. :—

In the Office of Chief Engineer of Irrigation, 25 changes.

In the Office of Superintending Engineer of S. W. Circle, 29 changes.

In the Office of Executive Engineer of Calcutta and Eastern Canals, 22 changes.

Both the Chief Engineer and Superintending Engineer have many other duties.

In Canada, U. S. A., and on the Continent of Europe they have permanent staffs of waterways engineers.

The Standing (Advisory) Waterways Committee is formed as under :—

President.

Member of Executive Council in charge of P. W. D., portfolio.

Members.

Four official—

- Chief Engineer for irrigation (Waterways).
- Superintending Engineer, South-Western Circle.
- An officer with financial experience (Secretary of the Financial Department).
- A Railway representative.

Five non-official—

- Vice-Chairman, Port Commissioners.
- A commercial member, Bengal.
- A commercial member, Eastern Bengal.
- A representative of the steamer companies.
- A representative from the National Chamber of Commerce.

If the engineer of the proposed Trust was substituted for the Superintending Engineer, South-Western Circle, the above body of representatives might form the General Committee of the Waterways Trust and probably be sufficient security that the funds provided or guaranteed by Government were being employed to the best advantage. Out of this general committee a small Executive Committee could be created.

STATEMENT NO. 2.

ADVANTAGES OF THE GRAND TRUNK CANAL ROUTE AND INLAND HARBOUR.

Mileage saving by proposed trunk route and existing Madaripore bhal canal.

From Howrah bridge via Sunderbans and Barisal to	Distance.	From inland harbour (Manicktola) via Trunk route and Madaripore bhal to	Distance.	SAVING.			Distances reduced by about
				By Trunk canal.	By Madaripore bhal route.	Total saving.	
	Miles.		Miles.	Miles.	Miles.	Miles.	
Chankuri-Pussur junction.	342	Chankuri-Pussur junction.	12*	12*	...	121*	One half.
Madaripore . . .	445	Madaripore . . .	209	121	115	236	Do.
Chandpore . . .	451	Chandpore . . .	267	121	63	184	Two-fifths.
Naraingunge . . .	485	Naraingunge . . .	277	121	87	208	Do.
Goalundo . . .	585	Goalundo . . .	271	121	143	264	One half.
Barisal . . .	888	Barisal via shortest branch route.	205	188	...	188	Do.

* If the Assasuni khal in the Grand Trunk route is improved, there will be a further saving of 15 miles.

Ton mileage saving by Trunk route.

On 1913-14 traffic figures 181,000,000 to 204,000,000† ton miles.

On the 15th year estimated traffic figures 277,000,000 to 310,000,000† ton miles.

† Based on mileage saved if Assasuni khal is used.

In addition to the ton mileage saved the Grand Trunk route will give the following advantages :—

- Greater safety due to absence of snags and avoidance of large open estuaries.
- Less liability to delays from silted channels (trouble increasing) and bad weather.
- The route would pass through cultivated country instead of through the jungle tracts of the Sunderbuns.
- Greater carrying capacity secured for vessels as the Trunk route being a safe one, vessels could be loaded to a greater draft—an extra foot being equal to, say, 25 per cent. additional carrying capacity.
- Avoidance of the great delays at the Howrah bridge and the difficulties of night running on the lower reaches of the Hooghly.
- Greater regularity in arrivals and departures of vessels.

The proposed inland harbour and canal would provide the great advantages—

- (1) of more up-to-date terminal facilities for handling cargo,
- (2) of many miles of slack water frontages for the development of industries, and
- (8) of better sanitation.

1.—Facilities for handling cargo.

"We possess a network of magnificent waterways unequalled in the world, which contain a few weak links that can be kept open by suitable dredging plant, and which require one short link to Calcutta which this project will supply" (*vide* Mr. Addams-Williams' report, page 35, line 2). "I believe I am correct in saying that there are over 20,000 miles of waterways in the provinces of Bihar and Orissa, Bengal, and Assam" (*vide* report, page 55, paragraph 97, line 16). These well matured views further demonstrate the urgent necessity of adopting for handling cargo in Calcutta modern methods which can only be fully obtained by the use of inland harbours and canals in the vicinity of a large terminus. In this connection the following may be of interest. In his very able book "Garden Cities and Canals," issued about two years ago, Mr. J. S. Nettlefold (author of "Practical Town Planning") says on page 19: "In uncivilized countries towns are built on the banks of rivers; in civilized countries the river or canal is brought to the town, etc."

(a) "As now laid out (*vide* report, page 39, paragraph 73, line 8) the water frontage of the proposed inland harbour and branch canal amounts to a little under 14 miles with a maximum over all length of 2½ miles from the offtake of the branch canal to the south-western corner of Harbour No. 2, and there is room for a large additional water frontage close by to the south of the branch canal." In designing the harbours "the object aimed at is to supply adequate frontage in communication by road and rail, so that, as far as possible, vessels will not have to move long distances in the harbour for various purposes" and "the main marshalling yard will be located on the north bank of the Kistopore canal, where it will not interfere with expansion (either of the harbours or of the city) but will, at the same time, be fairly central."

(b) *Inland exports*.—The harbours as planned would give up-to-date methods for dealing with traffic. Transit sheds for *inland exports* (general) would be provided, having ample frontage accommodation with little variation in water levels where vessels could moor within a few feet of the sheds. It will also be easy to adopt a system of road communication, etc., by which street traffic congestion could be much minimised and perhaps avoided altogether. Freight coal can be dealt with on the north side of the Kristopore canal near the marshalling yard, while provision can be made for bunker coal on the north side of Harbour No. 1 near the eastern end. There would be ample room for salt golahs.

(c) *Inland imports*.—"In the north-west corner of the (salt) lake is a suitable site for the institution of a *jute bazar*. As designed, the area available amounts to 795 bighas and has a water frontage of two and a half miles" (*vide* report, page 38, paragraph 70, line 14). There would be also good direct rail and road communication with the above site. Vessels with jute consigned direct to mills and presses would have ample accommodation for transshipping their consignments into barges within the canal and harbour system. "If the *tea industry* requires accommodation at the harbour, a good site (frontage 3,000 feet or more) is available on the west bank of the western jute dock; another possible site (frontage 3,500 feet or more) is on the south bank of Harbour No. 2 to the east of the Surah Jute Mills" and parallel with Narkaldanga road (*vide* report, page 39, paragraph 71, line 6). There would be in either case good rail communication with the tea districts and docks and probably later on direct canal communication with the latter.

(d) "The shape of the harbour will enable vessels to turn easily at the western end, while at the same time providing somewhat extra water frontages and a large area on the island between the two Harbours (Nos. 1 and 2) for the housing of coolies, etc., and for offices, all of which will be close to the points at which the exports and imports are handled" (*vide* report, page 38, paragraph 68, line 8).

(e) *Passenger traffic* will be dealt with at the transit sheds, where a tram connection can be supplied from Upper Circular road *via* the Manicktolla road" (*vide* report, page 38).

(f) "The western end of the harbours can be utilized for *merchants' godowns*. This site appears to be most suitable since the lead to town is the shortest. Foreign imports from the docks can be dealt with to the west of this site, which will be connected by rail with the Eastern Bengal main line to the south of the Ultadinghi road. Merchants requiring delivery of their goods at the harbours for export can therefore arrange to have them booked through from the docks; if delivery has to be taken at the Port Commissioners' Foreign Import Depot at Balliaghatta, the goods will either have to be carted from Balliaghatta to the harbours or into the town first and then back at the harbours; town deliveries can be made at Balliaghatta Depot" (*vide* report, page 38, paragraph 69).

(g) *Rice trade*.—A large triangular area (with two to three miles frontage round it) between the south-east of Harbour No. 2 and Dhappa could be devoted to the rice trade. There would be complete rail connection with up-country stations and docks. The latter connection could be shortened by making a branch line through Dhappa to the main line south of Balliaghatta. As regards a safer and quicker water connection between the docks and inland harbour, that would be obtained when the following proposal is carried out.

(h) "Another improvement, which could be made at some future date, is the opening up of an inland water connection with the Kidderpore Docks by means of a canal (from the canal and inland harbour system) across the southern lake and thence *via* Tolly's Nullah and the Port Commissioners' boat canal, which could be used for direct shipment if a demand for such convenience arises. This connection would save delays at the dock entrance" (*vide* report, page 40) on the river as well as provide a safer and quicker route between the inland and ocean docks.

2.—Slack Water Frontages for the Development of Industries.

(a) "When the trunk canal and harbour are made, Calcutta will be provided with significant additional waterway running due east at right angles to the Hooghly along which communication can be carried on, every part of the harbour area being capable of being connected by road, rail, and water communication (*vide* report, page 36, paragraph 65, line 16).

(b) As previously stated, the branch canal and harbour area will afford 14 miles of water frontage. Some sections of this frontage will be available for industries. Along the main canal, which will have a total length of 24 miles, there will be many suitable sites for industries. The whole of its northern bank can be easily connected by rail right up to Kulti. The section (18 miles in length) of the main canal between the branch canal off-take at Kulti will ultimately have a bed-width of 400 feet.

(c) Local services of small steamers could run frequently on the canal and trunk route and bring the districts tapped in much closer communication with Calcutta, which would have a modern inland harbour to assist in the development of industries, fisheries, agriculture, horticulture, and gardening, etc. It is proposed to have fish and produce markets on the north side of the canal.

(d) Rangoon has 14 small local services running daily to various parts of the delta.

3.—Better Sanitation.

"The eastern portion of the Manicktolla Municipality is a low-lying waterlogged area, the level of the land being at the same level as the lake; in the rains this area never dries; the sanitary conditions leave much to be desired; the drainage is carried on by means of open drains, many of them *kutcha*, running along both sides of the roads, and is discharged into the lake, when possible, at low tide, in the crude state. The gradual deterioration of the (Bidiadhuri) almost entirely prevents any flow in the drains for days together in the rainy season when low water level in the river is about the same as that of the land; many of the houses in the compounds of garden houses are connected with the roadside drains, and a more sanitary arrangement can hardly be imagined" (*vide* report, page 35, paragraph 63). "Of the area which is bounded by the railway on the west, the new cut canal on the east, and the old danga road on the south, a little more than one-sixth is composed of irregular tanks" (*vide* report, page 35, para. 64). As pointed out above, much of this area is at the same level as the salt lakes. "The spoil excavated from the basin (Harbour No. 1) will be sufficient to raise the land to about 10.50 or 11.00 (level of the salt lakes and low-lying ground being 8.00 to 9.00) or to the level of high water of springs, and the result will be the removal of this insanitary area from the neighbourhood of the town" (*vide* report, page 36, paragraph 65). "The modern dredger affords the means of economically raising or reclaiming large areas of land within a radius of two miles or more of the point at which the dredger is working. The present method of filling up existing tanks and raising land in this way is very costly and also unsatisfactory from a sanitary point of view, as further tanks are created in the neighbourhood of Calcutta in the course of obtaining the reclaimed earth."

ORAL EVIDENCE, 7TH DECEMBER 1916.

President.—Q. Can you give us some idea of the duties of the Advisory Committee on the ways?—A. They consider the important points brought before them, and advise on them. Q. But who takes action on the advice?—A. The Government of India and sometimes Assam.

Q. What about Assam; does this Standing Committee extend to the water-ways of Assam?—A. To a certain extent. Of course we want to extend to the higher reaches of the river.

Q. Is no body looking after that?—A. To a certain extent.

Q. If anything is wanted in the way of dredging or deepening of the higher reaches of the Brahmaputra, do your two companies do that on your own account, or does the Government do it?—A. We have done it on our own account. Sometimes we have got small subsidies from Government in connection with Dibrughur.

Q. In regard to this statement you have given us, showing the ton mileage saved by this Trunk route; what are these figures?—A. The ton mileage saving on the Trunk route is given, in 1913-14, 181 to 204 million miles. Does that mean the actual traffic or the estimated traffic?—A. The actual traffic in 1913-14 on the mileage likely to be saved.

Q. But not making an allowance for increased tonnage that would occur if you had a better route?—A. That is 300 million ton miles in the 15th year.

Q. The proposal that you want us to back is this proposal regarding the formation of a Water-ways Trust, similar to the Port Trust of Calcutta?—A. Yes, so as to get a permanent body of waterway men.

Q. And they would have their own regular engineers and financiers?—A. Yes, they would draw from special experts.

Q. Do you approve of the proposal made in this report, regarding the financing of a Trust like that?—A. I have been through the report.

Q. But do you approve of the proposals?—A. Yes, the scheme as a whole.

Q. This has the general support of the I. G. N. Co.?—A. Yes, as also that of the R. S. N. Co., and the B. A. S. Co. (Messrs. Andrew Yule's Co.).

Q. This is a fairly new estimate?—A. Last year's. It is a revised estimate.

Mr. C. E. Low.—Q. What would be the effect of the canal scheme on the cost of transport from Eastern Bengal here?—A. We save so much ton-mileage, but I cannot give you the figures as regards actual cost.

Q. In the case of 100 miles saved by this means, what would, roughly speaking, be the saving in cost of carriage, assuming other things to be equal?—A. I could not very well answer this. I could only tell you actual ton-mileage saved.

President.—Q. You are quite sure that it is going to reduce the cost of transport from here to Eastern Bengal for instance?—A. Yes, we reduce the distance in many cases to one-half to Eastern Bengal.

Q. But we want some idea of how much the actual trader is going to benefit by this?—A. It is difficult to prophesy what you have to pay for coal, material, etc., in future, but you can see the advantage, if you save half or two-fifths the distance to Eastern Bengal that the public would eventually get the benefit of it. The waterways being open to everybody you cannot make a monopoly of it.

Q. Have you any ideas with regard to the improvement of waterways away up the north-west on the Ganges; you have not included that in your statement?—A. Not in the estimate at all; that is a matter, I think, which should be taken up so that the lower reaches of the Ganges and Brahmaputra may get improved. Many of the troubles are caused by snags; they constantly change the course of the rivers and keep the channels in a turmoil.

Q. Would you put the Ganges under this Waterways Trust, as well as the Brahmaputra?—A. Yes. Take the German Rhine. It was under three principalities. Not working to a common standard and their efforts did not obtain satisfactory results. Now it is under one Chief Engineer, and they have one common standard. In the United States of America all the waterways are under the War Department (Corps of Engineers).

Q. Has your activity in the case of river steamers been diminished in recent years by competition with railways, or by the silting up of the rivers? Has the radius of action of your India General Navigation Company been diminished during recent years, or has the traffic been increasing?—A. The traffic has been increasing. It has been doubled during the last ten years.

Q. Have you relinquished any of the routes that you used to carry out in the upper reaches of the Ganges?—A. We used to run up to Allahabad at one time. That has been knocked out by the railway competition and the bad river. In my time we used to run up to Benares, but some of the channels were bad. We also ran up as far as Fyzabad, but had to give it up on account of the river Gogra being so bad.

Q. We will study these documents you have sent in, and will probably get all the information we want out of them?—A. Owing to there being so many changes amongst the officials we are anxious to get your help, your backing, as it were, as soon as possible.

Q. How many years has the India General Navigation Company been in existence?—A. We started in 1844.

Q. You have a direct connection also with the Rivers Steam Navigation Company?—A. Yes, I am representing them at this meeting. I am also the Bengal Assam Company's representative.

tenders of machinery from some leading Scotch firms, some German firms, a leading Swiss firm and many American firms. The tenders of a Scotch firm, a German firm and a Swiss firm were most suitable for our purposes. The Continental firms had our grass converted into paper and sent the manufactured paper to us. We found the paper to be of excellent quality and very suitable for book-work.

A representative of the Scotch firm came to see me at Calcutta after supplying some bamboo pulping plant in China. He advised me that bamboo would be the most suitable material for preparing pulp for paper manufacture in India. Bamboos of two years' growth would give excellent pulp and the paper manufactured from it would be strong in texture and light in weight. The paper may be of slightly creamish tint but would be very decent in appearance. I was told that bamboo-pulp paper was being manufactured then in China. About six lakhs of rupees would suffice for the setting up and working of a bamboo pulping plant in any locality where bamboo is available in abundance.

We came to the conclusion from the tenders we received from the Scotch and Continental firms that a paper mill for preparing paper from *sabai* grass may be started and worked with a capital of 15 lakhs. Unfortunately the Maharaja died at that time and the scheme fell through.

My idea is that bamboo pulping plants may be set up with advantage in Eastern Bengal, Assam and Burma. As they must be located on river-side, cheap water carriage would be available for transporting the pulp to Rangoon or Calcutta and paper mills may be set up in these commercial towns where the manufactured paper would find ready market. Paper is selling now at famine prices. With Government assistance surely such industries may be promoted. Some of the enlightened Indian princes are very keen on promoting such industries for benefiting their subjects.

Financing agencies

If co-operative banking societies may be suitably organised throughout a province and a central bank may be established at its capital, the banking facilities for industries will greatly increase. But the organisation and supervision must rest with the Government.

Should there be a Provincial Director and a Board of Industries, they might in suitable cases recommend the financing of particular industries or factories either out of Government funds or through specially organised banking agencies such as central or local co-operative credit banks, on sound business lines. Government can borrow at a much lower rate of interest than private individuals and they will be able to grant loans at easier rates of interest and on more favourable terms than existing banking or money-lending concerns. Government may also with little risk advance money to manufacturers who turn out articles of which the Government is a large purchaser.

The Director of the Board of Industries will of course have to be satisfied about the quality as also the capacity of the factory to turn out the requisite quantity. In such cases advances may be safely made against the output which the Government may take over in repayment or liquidation of loan. Machineries on the hire-purchase system may be supplied by Government to suitable industries on the recommendation of the Director and the Board.

Co-operative societies amongst weavers, metal workers and people engaged in other cottage industries are essential for their existence and improvement.

Government certificates of quality especially with regard to chemical industries, iron and metal manufacture, and various other articles regarding which it is possible to grant such certificates would surely serve a very useful purpose.

Limits of Government assistance.

I would not put any limitations on Government aid to a new enterprise if it competes with any established external trade. Where a fresh private enterprise may be demonstrated to cheapen the cost of production and price of articles, Government aid may be granted even if such industries would go to compete with existing ones. But where over-production would lead to the curtailment of normal profits, it would not be desirable to grant any Government aid.

Technical aid.

Loan of Government experts may be given to help private firms and companies to remove difficulties or defects or economise the process of manufacture or to improve the method employed. The help may be given gratuitously or for a charge agreed upon. If the process is a speciality of any firm or company, the result of the researches at the latter's expense should not be published except on such terms as may be pre-arranged between the firm and the Government. If the process is common to many similar industries, the result should be published.

Research abroad.

The researches with regard to Indian industries should be carried on wholly in India. The researches abroad may be communicated to the Research Institutes in India and references may be made to Research Institutes abroad when necessary, but no such Institute should be maintained by India outside the country.

Surveys for industrial purposes.

Further surveys may be carried on by Indian students after post-graduate or other suitable training under the guidance of appropriate Government Departments. The results of surveys should be published by Government in English and vernacular.

Commercial museums.

The mere formation of commercial museums or emporia or even sale agencies in the principal towns of India and outside India would not be of much good unless the persons in charge of such museums, emporia or agencies are in a position to give suggestions on lines that would make products of 'unorganised cottage industries' readily marketable. More

display of the products of Indian cottage industries in foreign countries will only enable the more efficient operatives in those countries to produce cheap imitations and deprive the Indian handcraftsmen of their bread.

My experience in connection with Indian industrial exhibitions has been that it helps the enterprising foreign businessman more than the Indian craftsmen. Exhibitions in which more economic and improved processes are demonstrated, useful machineries and their use are displayed are more profitable to this country. The Government should help and assist in the organisation of exhibitions of this kind periodically. Exhibitions should be popular in character.

The appointment of trade representatives either outside the province or abroad pre-supposes manufacture on a larger scale and in the present state of the industries, they will not be of much use. Trade representation.

The publication of a list as also exhibition in the commercial museum of imported articles used in the Government departments including the railways, and the Army clothing, equipment and supply departments would be very useful to Indian manufactures. When Provincial Boards of Industries are established, they should be consulted regarding the purchase of Government stores. Their recommendations regarding the purchase of stores in India should be acted upon by the Government departments. Government patronage.

It will be of great assistance to some industries such as match factories, pencil factories, tanning and some chemical industries such as the manufacture of methyl alcohol, etc., if the Government would supply wood and other forest produce on favourable terms. Forest administration requires revision on business lines. Supply of raw materials.

I took prospecting lease of forest produce of the Maurbhanj State for three years and collected and exported such produce to England, America and Germany. It would be more profitable if they could be put to industrial use in this country. The lease terminated on the death of the Maharajah.

The tenants' rights secured by the Bengal Tenancy Act do not afford much scope for carrying on agricultural operations on a large scale, nor for the development of industries dependent on agriculture, such as sugar, etc., on a commercial scale. But it would not be practicable or even politic to interfere with tenants' rights for the prospective development of agricultural industries. The remedy lies in organising co-operative societies amongst the tenants for such purposes. For instance, sugar on a commercial scale cannot be manufactured profitably unless large tracts of suitable land are put under cultivation for the purpose. By co-operative organisation not only may this be done but capital may be secured and plants may be obtained and worked. The Government may also advance loans and supply machinery on hire purchase system in such cases. Land policy.

Where Government owns *khas* land, it may grant lands on favourable terms for the establishment of new industries or the development of existing ones.

The existing provisions of the Land Acquisition Act furnish sufficient scope for the acquisition of land for industrial companies. I would not make the powers conferred under the Act too lax. But Government may be empowered to acquire land for pioneer or demonstration factories. As "public purposes" are not defined in the Act, I presume no court of law would interfere with the discretion of Government if it declared such purposes as public purposes. If any doubt is entertained with regard to this matter, a suitable provision may be made in the Act to remove the doubt. Land acquisition.

I am of opinion that to increase the efficiency and skill of labourers generally, it is necessary to make them go through a course of elementary general education early in life and supplement it by a course of technical education according to locality, the occupation of the boys or their aptitude for any particular kind of work. Training of labour.

Free and elementary primary education for the boys and girls of all classes and supplemental technical education are absolutely necessary for the industrial development of the country.

Factories and workshops in India are reluctant to take apprentices except for their own requirements. So their usefulness as training institutions is almost nil in this country. Technical schools can alone meet the general demand for industrial education. Apprenticeship system.

I have found Bengalee youths particularly quick in acquiring technical knowledge of the working of even complicated machinery.

I believe, I was the first in Calcutta to introduce the Linotype composing machines in the printing press I have to keep for publishing the *Calcutta Weekly Notes* which I edit. The difficulty that confronted the then Agent of the Linotype Machinery Trust was the difficulty of getting suitable operators. I got some very young but smart compositors apprenticed at the Linotype office. They not only turned out to be good operators but mastered the details of the working of the machine within three months. These boys had just enough school education to be able to read, write and spell fairly well. I found that boys of the better castes turned out to be as efficient as those who belonged to the mechanist class. The Trust advised me to employ two of my trained men as operators and a mechanic for looking after the machines. But after a short time I found it unnecessary to keep a mechanic. The operators were as efficient in looking after the machinery parts as the mechanic. Ever since then I have not kept any mechanic and the machines have always worked without

any hitch. I was also told by the then European foreman of the Trust, that the record of the boys as operators did not compare unfavourably with first-class operators in other parts of the world.

I found at the same time that men of much maturer age, who were very fast hand-compositors, did not turn out to be successful operators. The best results I obtained were with youths of about 20 years' age.

In the pencil factory of which I am a Director my experience has been the same. There I found that boys with a fair amount of education supplemented by some technical training at the Bengal Technical Institute, turned out to be very efficient foremen and boys of the class used to manual labour turn out under such supervision to be very successful operatives. The same has been my experience with regard to some hosiery factories both at Calcutta and in the mofussil, Pabna for instance. I and some of my friends had also got some Bengalee youths apprenticed at weaving and spinning mills at Nagpur, Rewar and Ahmedabad and every one of them proved a success. But Bengal does not yet afford sufficient scope of their employment in the province. A graduate in chemistry whom I got apprenticed at the Empress Mills, Nagpur, after learning all that could be learnt there, obtained a State scholarship and had further training in England and returned home recently. I do not know if he has been usefully employed. Another under-graduate whom we got apprenticed at Messrs. Fielding and Platt in England in their mechanical department, after receiving practical training as a mechanic later on got apprenticed in some Dundee Jute Mills where he qualified himself both in the weaving line and also in jute mill machinery and finally obtained the degree of B. Sc. at the Manchester University and won gold medal at the City of London Guilds Examination in jute weaving, etc., but after seven years' training in England he cannot find employment in this country because of his Indian nationality. Instances of this kind may be multiplied from every province in India.

How far industrial education to replace literary education.

In addition to the establishment of special industrial schools, it would be desirable to provide evening classes for boys who are already employed in industries. Primary education should be compulsory for all boys and the above schools and classes should be supplementary. Now the only system of education which obtains in this country is literary or university education. In the absence of any form of practical education all flock to ordinary schools and colleges. But these cannot give a career to all. Many after passing through the grinding of the university up to the age of twenty or more, go out in the world without any business ideas or practical training and look upon life as a blank. It is absolutely necessary to draw out a large section of our youths from the schools and put them to some practical training which will give them employment and occupation in life. I would fix the ordinary school-leaving age at 12 and then put them to some school where they may receive technical training with so much of theoretical training thrown in as would expand their mind and intellect.

I would place the primary schools under the general Education Department of Government but would have a separate director for the industrial schools. The industrial schools should be placed under the supervision of the Provincial Director of Industries and the Board. The Provincial Government shall be the only connecting link between the two Departments of Education.

Skilled managers, etc.

In order to train skilled managers and supervisors, people who have received some training in the line or are engaged in the business or private firms may be given help or sent out on deputation for study or special enquiry in other countries.

Female education on practical lines.

I also believe that by the spread of female education on practical lines and by training women for carrying on home industries, such as the manufacture of hosiery and other knitted articles, lace making and the making of trimmings, etc., they would be able to supplement their husbands' earning and also maintain themselves during widowhood. Women of all classes used to manufacture yarns and were in fact the backbone of weaving industry in India. The spinning mills have deprived them of a profitable occupation and they may even now take to useful cottage industries, if the necessary instructions are imparted to them through female teachers specially trained for the purpose. Some amount of education and training would increase the efficient and scope of female labour generally.

Official organisation.

In my opinion there should be a Director of Industries in every province and specially in Bengal. The Director for Bengal should be a man well versed in chemical technology and should be assisted by some specialists in special branches of textile and other industries for which Bengal offers special scope for development. If it be not possible to engage a number of specialists to form an efficient Board of Industries, an Advisory Committee composed of men of experience and influence may be formed to assist the Director.

This Board or Committee may be composed of official and non-official members, the former being selected from the agricultural and such other special departments who may combine special knowledge regarding some branch of industry with a knowledge of the special circumstances of the province in relation to such industries. The non-official members are also to be selected on the same principle; men of general education with a scientific training and some business experience would be very serviceable on such Boards.

In the Provincial Board for Bengal there should be men who can not merely give advice but organise and promote industries for which Bengal offers special opportunities. I am of opinion that it is very desirable to have an Imperial department of experts not merely with

regard to the larger industries but also in connection with industries generally. The Imperial department should consist of specialists only.

For instance, I have said that the Director in Bengal should be a man well versed in chemical technology. But he may not necessarily be a specialist in agricultural chemistry. Chemistry is such a vast subject that it is impossible for one man to master all the various branches of its technique.

This is where I think the usefulness of an Imperial department comes in. In the Imperial Department there may be more than one specialist in chemical technique.

Imperial
Department.

(a) For instance, there may be an expert in agricultural chemistry, there may be one who may be an expert in the manufacture of dyes and another capable of advising the Provincial Directors regarding the manufacture of acids, alkali and other chemicals on a commercial scale. I am of opinion therefore that the Imperial Department should have several chemical experts attached to the department.

(b) An expert in leather and hide industries would also be useful.

(c) For glass-making experts in the Provincial Boards would be more useful.

The same with regard to—

(d) sugar and

(e) oil seed industries.

I would suggest that there should also be an expert electrician and expert metallurgist attached to the Imperial department. The Imperial department may be organised under an expert scientist and all his expert advisers need not be centralised in one place but may be located in places which offer special facilities for their usefulness and for the carrying out of experiments or researches. Their opinion may be sought when required.

The function of the Imperial department should be investigated, research and advice in connection with the work of the Provincial Boards and also the co-ordination of Provincial efforts. The Imperial department should be provided with laboratories and museums or experts of the department should be located in places where these facilities are available. The museums and laboratories need not be centralised in one place but may be located in places which offer special facilities for investigation and research.

To start with, there might be a Director for each province assisted by one or more experts to assist him in drawing up schemes for the promotion or development of any particular industry for which the province may offer special opportunities. For instance, the manufacture of paper and the obtaining the pulp from bamboo or suitable wood or some substitute for it should immediately engage the attention of the Governments of Bengal, Burma, Assam and the United Provinces. The same may be said of glass. Other industries, some of which I have already indicated, may be similarly developed under the guidance and direction of a Provincial Industrial Department.

Provincial
organisation.

The department may engage experts when necessary. But the Provincial Director should ordinarily have an Advisory Committee and this committee should form a connecting link between the Director and the people. In the Advisory Committee there may be some Government officers who are well acquainted with the existing conditions of some of the more important industries (such as agriculture, weaving and sericulture), some scientific men who are interested in industries or are engaged in research in their connection, some representatives of the capitalists and the landholding classes and some representatives of the educated middle class. The Advisory Committee should not be larger than a body of seven. But sub-committees of co-opted members may be formed for special industries or special purposes or for local areas. A member of the Board may preside over the sub-committees when necessary. The Director and his Industrial Board may be located in the capital of the province but in addition it is very desirable to have also local consultative committees in the mofussil. The Director and his Board should try to create an industrial spirit in the country and if they can do this both capital and enterprise will be forthcoming.

The Provincial Director of Industries should have a seat in the Provincial Council and should budget for grants, subject to the sanction of the Council. Power should be given to Provincial Councils to float provincial loans subject to Imperial sanction.

If the Imperial department consists of specialists, the provincial department will seek their advice or assistance when necessary and also obtain through the Imperial Department information as to what is being done in other provinces and in other countries. The Imperial department shall have a specialist department and also an information bureau and a special Statistical Department. All information regarding marketing products should also be available from this department.

There is no scientific and technical department at work in Bengal worthy of the name. Technical and scientific departments.

In order to aid industrial development it is obviously necessary to organise an Imperial Scientific and Technical Department. It should work hand in hand with the Imperial Department of Industries and the Provincial Boards. The Imperial Scientific and Technical Department should be under a scientist of European reputation, well-versed in scientific technology. His department must be a part of the Imperial Department of Industries. He should be in

direct touch also with the Education Member of the Government of India as also with the Directors of Public Instructions in the different provinces.

Technological research institutions should be established in every province and should be attached, if possible, to technical colleges in the capital of each province.

In Bengal the college of science may be fitted up with laboratories which may serve the purposes of a research institute. A technological college should also be established by Government, properly equipped, on the lines proposed by the Hon'ble Mr. Lyon, regarding which nothing has been done since his announcement.

The technical college in Bengal should aim at the development of technical industries, which in fact form the backbone of other industries. The electrical industries and other industries for which Bengal is especially suited, some of which have already been mentioned by me, should receive special attention there. Each institution of the kind should be allowed to develop in each province on some lines specially suited to the province.

With regard to research institutions, the co-ordination of work and results may be secured by the publication of journals in which the particulars of research as also the results may be published.

Colleges attached to the universities should also be encouraged to carry on research work. Even if there be some overlapping of activities in this direction, it would have beneficial results than otherwise.

It would be premature and undesirable now to confine the research activities of the technical department, technological institutes, colleges and universities to particular grooves. Specialization will come in course of time. At present the general spirit of investigation should not in any way be checked.

A college of commerce in each province will not only assist Indian industries but will encourage a spirit of commerce with foreign countries. Such colleges besides giving business training may serve to train a body of men who will be found of great service in the management of companies, banking concerns and firms engaged in foreign trade.

Statistics, journals
and monographs.

The department for the collection of commercial intelligence should be a branch of the Imperial Department of Industries and this department should directly collect, tabulate and edit industrial statistics.

It would be beneficial to establish or assist 'general' industrial journals in the vernacular languages. But before the introduction of technical training on a large scale special industrial journals will not be of much good.

Monographs of Forest and Geological Departments have, to a certain extent, been taken advantage of by enterprising men in developing jungle products, sericulture, mining industry and the like.

Certificates of quality.

For chemicals which are used as medicines and articles of prepared food, certificates of quality should be compulsory. For other manufactured products and articles it should be left to the option of manufacturers to obtain certificates.

Prevention of adulteration.

Penalties for adulteration should also be confined to articles of food and medicine.

It is very desirable to make legislative provisions for the registration of partnerships and the disclosure of names of partners.

Hydro electric
power, etc.

Waterfalls in the Darjeeling District, in Hill Tippera, in Chittagong District, in Maurbhanj and in Ranchi Districts might be utilized for generating hydro-electric power. The late Maharaja of Maurbhanj consulted some leading electric engineering firms in England regarding the saddling of some water-falls in his State for supplying electric energy to Calcutta for manufacturing purposes and the project was considered as quite feasible by experts.

Railways and waterways.

Railway freight does to a great extent interfere with the success of many local industries. There should be a special manufacturer's scale of freight. For instance, pencil and match factories in Bengal have not flourished partly because of the difficulty of getting suitable kinds of wood from the hills or from a distance. We have found it more convenient and less expensive to get wood for pencil from East Africa, than from any of the Indian forests.

Waterways.

Waterways formed, before the advent of railway, the chief means of communication and transport in Bengal. Most of the offshoots of the big rivers in Bengal become unfit for navigation even for small boats during the summer owing to their sources being blocked by the deposit of sand and mud after the flood (rainy) season. It is possible to store up some of the huge quantity of water that unprofitably flows into the sea annually and also to open up the sources of the minor waterways and utilize them all through the year for purposes of cheap transport. They would not compete with the railways but would serve as feeder lines. This would benefit the agricultural population greatly. Cart transport to railways is very costly and takes away a large percentage of the profits of the producer. There should be a special department of either the Local or the Imperial Government for improving the waterways of Bengal. The improvement cannot be effected from provincial revenues but must be done with borrowed capital which may be made to yield handsome returns to the people and the money so invested. The offshoots of the Ganges (Padma) in Bengal may all be made navigable. Many of them have been killed by reckless public works and railway engineering.

The expert report recently published by Government shows that. Many of the waterways in Bengal have got silted up through accident and neglect. The injudicious putting up of embankments, the sinking of heavily laden barges or fall of big trees at the sources after storm or bamboo and mat or other obstructions put up for fishing purposes when the water goes down after the monsoons, have gone to silt up many minor streams in Bengal at their sources of supply from the big rivers. The offshoots of the Ganges which might with advantage be restored to navigation for minor crafts all through the year are :—

The Bhagirathi (river Hoogly), the Bural which rises at Sardah (Rajshahye) and flow into the Brahmaputra at Bera (a great jute mart) and which is a great short cut for country crafts from East Bengal to West Bengal, the Ichamati below Pabna, the Nadia rivers (Jalangi, Mathabhangha-Churni, Ichamati and Bhairab branching off through Nadia and Jessore Districts), the Kumar and Chandana which flow through Faridpur district, all of which take their rise not far above the Sara bridge, Eastern Bengal State Railway; the Gorai which takes its rise a little below the Sara bridge to the west of Pabna; all these rivers used to give not only good drinking water to men and cattle but also great transport facilities to ryots both in Deltaic Bengal and in North Bengal.

(Note.—Witness did not give oral evidence.)

WITNESS No. 119.

HON'BLE RAI SITANATH RAY BAHADUR, *Merchant and Banker, representing the Bengal National Chamber of Commerce.*

Hon. Rai Sitanath Ray Bahadur.

WRITTEN EVIDENCE.

Q. 1.—I have had some experience of raising capital for one or two industrial enterprises. True it is that the Indian capital is somewhat shy and requires a good deal of coaxing for investment in industrial enterprises, but about eight or ten years before, when there was an outburst of enthusiasm for industrial enterprises, and in cases where promoters were well known personalities or men of standing and character, the difficulty was not so acute in raising capital for industrial enterprises. But the difficulties multiplied after the failure of the several Indian managed enterprises, especially after the failure of the Indian banks. Capital for industrial enterprises came from all classes of people; a large amount came from the middle educated classes, and some even from people of limited means. The difficulties that are now-a-days met in raising capital are as follows :—

- (1) Want of faith in the efficiency of management and want of expert knowledge on the part of managers.
- (2) Too many restrictions placed on the formation of a limited company by the amendments made in the new Companies Act, chiefly the material curtailment of time within which a limited company should be registered and material curtailment of time within which share-lists should be closed.
- (3) The important trades of this province are jute, rice and coal. A very large amount of money is required in financing these trades and the share of the indigenous capital in financing it is considerable. What remains of the capital in the hands of the large capitalists is invested in land which offers a more tempting security in this province. To them therefore industrial enterprises even with prospective high dividends, offer very little inducement for investment especially because of the risks and uncertainty involved.
- (4) Disinclination of the several banks to give financial assistance or loans to Indian managed companies, however good and sufficient the security offered may be.

The difficulties in raising capital may be removed and Indian capital to some extent, may again be drawn or allured to industrial enterprises in the following ways and under the following conditions :—

- (1) Soundness of the enterprise, that is, whether the enterprise would be commercially profitable.
- (2) Loan of the services of Government experts on favourable terms.
- (3) Efficiency of management, that is, the management should be conducted by one who has practical knowledge or experience of the enterprise.
- (4) Guaranteeing dividends for a limited period; the condition of guarantee is essentially necessary in view of the fact that capitalists now-a-days do not experience much difficulty in investing their money on good security, that is, on the security of land.

In view of the security furnished by lands, capitalists cannot be easily induced without guarantee to invest their money in industrial enterprises which involve an element of risk and uncertainty. Of course provision should be made for subsequent refund to Government of the

expenditure incurred in paying dividends at the guaranteed rate, with powers to Government to make concession whenever it deems it fit.

- (5) Another suggestion that I have to make in this connection is the establishment of a large industrial bank in every province, that is, in the provincial capital with branches in all important centres of trade and industry.

It is a painful fact that industrial enterprises under indigenous management do not get the usual banking facilities from the several banks which are all under foreign management and without banking facilities it is not possible to develop industries.

Q. 2.—Large industrial enterprises in this province are mostly conducted with foreign capital. The middle classes of the province and some of the large capitalists have been recently subscribing to industrial enterprises especially to light railways guaranteed by Government and individually starting industries on a limited scale.

Government assistance.

Q. 5.—I heartily approve of the following methods of giving Government aid which will go a long way to develop existing and new industries. With the exception of the methods described in clauses (1) and (6), the other methods will readily commend themselves to all of us.

Guaranteeing dividends for a limited period is one of the best forms in which financial assistance can be given to existing or new industries. This will help to draw capital from other channels of investment to industrial enterprises. In Bengal on account of the uncertainty and risk incidental to industrial enterprises, a large amount of private capital is invested in land; so guaranteeing of dividends for a limited period may induce capitalists to invest their money in a large measure in industrial enterprises. It is reasonable to make provision for subsequent repayment of the expenditure incurred in paying dividends at the guaranteed rates. What I mean is this, that when an enterprise or an industrial concern has shown profit enabling it to pay dividend at a certain reasonable rate then the surplus profit after providing for reserve should go to repay Government money. I do not approve of giving Government aid by money-grants or by subscription of part of the share capital.

Besides guaranteeing dividends for a limited period, loans should be advanced to industries generally with interest on easy terms but in particular and exceptional cases, short or temporary loans may be granted for a limited period without interest.

To my mind it is not desirable to offer any money grants-in-aid or even loans without interest, or indiscriminately to guarantee dividends, without provision for repayment of the expenditure incurred for guaranteeing dividends, as too indiscriminate generosity in a matter like this may lead to the growth of unsound enterprises.

Sub-clause (5)—Supply of machineries and plants on hire purchase system would considerably help the development of cottage-industries, where the value of machinery is small and the variations in the prices of different makers are negligible. But it has to be seen how far this system can be made profitable in the case of large industries where the value of machinery is very large and the quality and the price of different makers greatly vary.

Sub-clause (7)—It would be a great incentive to the promotion and development of industries, and it will indeed be of substantial help to many industries, if the Government would undertake to purchase the products of certain industries for a limited period. It would help the industries to grow and eventually become self-supporting.

Q. 6.—In the case of Government guaranteeing dividends, some control is necessary to ensure good and economical management. These powers may be exercised by a competent officer being placed in the Board of Directors. In the case of a loan, the Government should have full knowledge of the actual state of affairs of the company concerned; this may be had by periodical auditing. In my opinion, Government control by the appointment of Directors should only be provided in cases covered by clause 3.

Pioneer factories.

Qs. 7 and 8.—It would indeed be a great encouragement to private enterprises and private capital if Government were to take the lead in establishing pioneer factories thereby demonstrating to the people whether a new industry would be commercially profitable. The utility of Government pioneer factories has been as reported, demonstrated in Java, Sumatra and elsewhere. In Java and Sumatra, the unique development of the sugar industry has been solely and wholly due to the establishment of pioneer sugar factories by the Dutch Government, where the Government not only provided the necessary plant but set up several sugar factories and provided working capital for their management. This continued to be done until the factories were in a position to show profit and it was after these factories had shown profits that they were made over to private capitalists. It is not possible for private capitalists with their limited means, as is the case in this country, to set up factories solely for experimental purposes. It is only a big Government like ours which can and should allot a certain amount of money every year for setting up experimental and pioneer factories for the development of industries.

The industries which offer prospects but which have not been already undertaken to any large extent and which are not likely to be undertaken in the near future, should be tried by Government by opening pioneer factories. When a pioneer factory has grown to be commercially successful, it should be handed over to a private capitalist or company when fully convinced of the capacity of the party for properly conducting the concern. A pioneer factory

should be closed or sold when a sufficient number of private or company-managed factories have grown around and proved successful. A pioneer factory should also be closed when it is found impossible to make it commercially successful.

Such pioneer concerns should alone be converted into permanent Government enterprises when there is no chance of private parties venturing to undertake such enterprises and when such industries are essential either for Government purposes or for purposes of public utility.

In this province the following pioneer industries may be undertaken with advantage as there are abundant raw materials available for them: sugar, glass, chemicals, alcohol, hardware, and matches.

Successful pioneering experiments should not be converted into permanent Government enterprises, but they should be made over to private capitalists or companies after they have shown a profit and more especially after the Government is satisfied as to the capacity of the private capitalists or companies successfully to carry on the work of the pioneer factories.

Qs. 9 and 10.—Excepting to some extent the industries started by Indians individually, where they generally limit the scope of their operations within their financial means, industrial enterprises under indigenous management are extremely handicapped for want of proper banking facilities in this province. Financing agencies.

Most of the joint-stock concerns recently started have not only suffered from bad management but also for want of financial assistance from the existing banks in the country. They therefore have to raise money by loans from private capitalists who, having no ready means properly to value the security,—the machinery and the plant,—give loans with much precaution and at a high rate of interest. This is generally the condition of industrial enterprises under Indian management in this province. There are no reasonable grounds to expect that the existing banks here will change their ways and readily offer proper banking facilities to Indian enterprises. Even then, it will be highly desirable to establish industrial banks in all important centres of trade and industry without which it will be vain to expect any great industrial development here.

The functions of these banks should be amongst others to advance loans to indigenous enterprises on their stock-in-trade and products, to stand guarantee for them in procuring materials and plant and machinery on credit and also to stand guarantee for merchants to whom the manufactures of those enterprises may be sold or given for sale on credit.

Q. 13.—Government should not lend its support or give financial assistance to any enterprise which would compete with or in any way hamper or discourage existing, or fresh private enterprises. Where private enterprises have already succeeded Government should stand aside. Limits of Government assistance.

To prevent Government aid from competing with existing or discouraging fresh enterprises, the following precautions may be adopted:—

- (1) Aid should be given to existing industries or to fresh enterprise only when such industries show possibilities of great development with such aid and when there is no likelihood of any fresh private enterprise being undertaken without aid.
- (2) Government should have power to regulate the price of the produce of an aided industry with the object that the produce of such an enterprise may not unfairly compete with that of an unaided one.

Q. 14.—When an industry is capable of being considerably developed in India and finally placed on a sound economic basis, there should be no limit to Government aiding such an enterprise whether it competes with an established external trade or not.

Q. 20.—Demonstration factories will be of great help in inducing people to take to industrial undertakings and in giving them a proper idea how best to work the different factories. The people are quick to appreciate advantages of improved methods and will readily adopt them, provided they are convinced of their usefulness which cannot be better done than by demonstration. Demonstration factories.

The organisation that may be established for the industrial development of the province should consider the industries for which demonstration factories might be profitably established. It appears that it may be so done in a large number of cottage-industries, such as, cotton and silk weaving, brass work, bamboo and mattress work, moulding and modelling, and tile making.

Qs. 28 and 29.—Commercial museums with complete arrangements for showing the process of development of suitable articles both indigenous and foreign and the raw materials necessary for their manufacture with indication of the places where such materials are available, and the quantity available, should be established on a proper scale in commercial and industrial centres. Business-men, commercial and industrial, should be associated in a board of management. The commercial museum established in Calcutta does not conform to those conditions. Commercial museums.

Qs. 31 to 33.—From a very long time and even now periodical Melas held all over the country, such as Sonapore Fair, Kisingange Fair, and Kartickbari Fair near Munshigange, serves the purpose of exhibition and sale, where a considerable amount of trade is done, supplying the requirements of the respective localities, carrying their superfluities and creating markets for new commodities. The Indian Industrial Exhibition that is being held every

year has given considerable impetus to some industries by bringing their productions into prominence and making them popular. Government should always encourage and help the holding of exhibitions like those mentioned above and should themselves also organise exhibitions in a comprehensive scale periodically. They should be popular in character.

Government patronage.

Qs. 37 and 38.—Before purchasing stores from outside, it would be better to advertise in the papers inviting local tenders for the supply of stores respectively required by the several Government departments.

It will certainly be of much help if the Government departments which use imported articles were to publish lists of those articles with their quantity and prices and circulate them free to commercial associations and manufacturing firms and also exhibit the articles in commercial museums. Such action will give useful guidance to industries. With regard to Government purchase, it is very desirable that the Government should make their purchases, whenever possible, locally.

Land policy.

Q. 43.—The Land Acquisition Act having been amended authorising Government to acquire land on behalf of public companies, I do not think it necessary to make further changes in the law.

Training of supervising and technical staff.

Qs. 51 to 53.—There should be technological colleges in different important centres for the training of young men with a view to turn out competent supervisors and managers to conduct industrial enterprises. The most competent amongst them should be helped with scholarships and the influence of Government should be exercised for their admittance into technological institutes and factories in foreign countries. This would enable them to acquire practical experience and study conditions and methods abroad. Concessions on these lines should also be made to competent men in suitable private enterprises in acquiring experience of foreign methods when found necessary. Government aided factories should be required to take in apprentices with proper safeguards for protecting their own interests and to train technical experts. For this purpose it will be necessary to undertake legislation. The railways both under State and company management should take in Indian apprentices in their workshops more largely.

Official organisation.

Qs. 57 to 62.—An organisation on a comprehensive scale is necessary for the development of industries. It would be expedient in the first instance, to appoint an Advisory Board of Industry and Commerce in every province, which should hereafter be developed into an executive body with budgetted funds and statutory powers which should be determined in the light of the experience gathered from the working of the Advisory Board.

There should be a Director of Industries with a staff adequate for the requirements of respective provinces. He should be a competent business man possessing the knowledge of local conditions and resources.

The Board of Industry should be constituted with representatives of provincial commerce and industry and the Director of Industries at its head; so long as it remains an Advisory Board, it would be advantageous not to make the Board too small.

The deliberations of the Board should be presided over by the Director of Industries through whom all the recommendations of the Board should go up to Government.

The functions of such a Board should be to investigate the possibilities of industrial enterprises, to secure and give expert advice for the promotion of industries, to advise Government in what way and shape financial aid should be given to industries and advise Government whether pioneer factories should be established, to show whether any new industry is commercially profitable.

The Director of Industries should be engaged in watching and guiding the existing industries of the province with a view to develop them and in making enquiries and directing researches to help the existing industries and to develop new ones. His function should also be to examine and report in each case of applications for Government aid.

There should always be interchange of ideas and of information amongst the Directors of Industries and periodical conferences should be held of the representatives of the several Advisory Boards and the Directors of Industries under the presidency of the Minister of Commerce and Industry.

For the present there does not seem any great necessity for establishing an Imperial Department of Industry. Imperial administrative control as far as necessary should continue to be exercised by the Minister of Commerce and Industry.

Reference libraries.

Qs. 78 and 79.—Books of reference are hardly available to the public. It will be of great help to industrial enterprises if reference libraries are established on a suitable scale in large centres of industry and commerce. They may be more appropriately associated with commercial museums wherever they may be established.

Colleges of commerce.

Q. 80.—Owing to want of provision for commercial training the commercial firms experience great difficulty in getting assistance who can render them real help in the management of their affairs. For want of men properly trained in commerce and competent to manage industrial enterprises there was recently deplorable failure of some enterprises in this province. It is very desirable to have a large number of men properly trained in commerce to conduct and manage commercial and industrial enterprises. A commercial college is therefore a vital necessity in this province. It should be established on the lines of the commercial college established in Bombay.

Q. 81.—Industrial development will follow commercial training. Proper commercial training combined with practical work will make one a man of business and it is only a thorough man of business not merely an expert with theoretical knowledge who can successfully conduct or manage an industrial business.

Q. 96.—In the interests of honest trade and commerce and for the protection of men actually engaged in trade and commerce, and to prevent fraud, it is extremely desirable that the names of partners of all firms engaged in trade and commerce should be disclosed to the public or should be capable of being ascertained by outsiders; otherwise non-registration of the names of partners gives opportunity to dishonest traders to evade liability. I know from personal experience that in several cases firms consisting of solvent and insolvent partners having failed in business, the solvent partners tried to evade liabilities by disowning all connection with those firms. Such a plea is invariably set up by partners living far away from the actual scene of business and in such cases it is very difficult to prove their connection with the firms. Instances have been known in which people, with a view from the very beginning to defraud the public, set up businesses in the names of their respective wives or minor sons, and when those businesses failed they invariably set up the plea of having no connection with the firms. There is a good deal of uncertainty as to who are partners of different firms and this hampers trade.

ORAL EVIDENCE, 7TH DECEMBER 1916.

President.—Q. In connection with question 43 you say that "the Land Acquisition Act, having been amended authorising Government to acquire land on behalf of public companies, I do not think it necessary to make further changes in the law." Is that quite correct? I understand that the Land Acquisition Act authorises a local Government to declare what is acquisition for a public purpose, but what you call a public company would not come under public purpose?—A. For sidings for jute mills I have known Government acquiring land under the Act.

Q. This is essential for the railway as a public carrier?—A. What I mean is that is for the convenience of the jute mills that land is acquired.

Q. You do not give the railway access to the jute mills. It is really an extension of the railway in order to make it more efficient as a public carrier. If a jute mill wanted to acquire land it could never get the sanction of Government. What we wanted to know was that in view of the fact that Government would not use the Land Acquisition Act and probably under the wording of the Act would not be justified in using that Act in order, for example that a jute mill might extend its godowns or even labourers' houses, do you think it is necessary that additional power should be granted to Government in order to acquire lands for the use of an industrial company which would be working for private and only indirectly for the public good?—A. That must be left to private arrangement. Otherwise the land owners will make a grievance of it.

Q. You are against Government using this power?—A. Certainly.

Q. You say in answer to question 81 that industrial development will follow commercial training. We have had a certain number of witnesses who seem to be under the impression that you must have your industries first before you can adopt anything like a system of training, because if you merely train the boys and turn them out of the school you will do them more harm than good. What is your opinion on that point? Do you think that in the beginning of industrial development it is better to allow your commercial colleges and your technical schools to follow the industrial development or to go ahead of the industrial development?—A. To go ahead.

Q. Then what will you do with the boys when they are turned out of the school?—A. Most of the men who have received good training have been able to secure good employment whether under the British Government or in the Feudatory States or elsewhere. The really expert man does not find any difficulty in getting employment.

Q. We have been told that many of the students who have been trained in technology and who have obtained degrees have not been able to obtain employment on their return. The question of training is apparently not successful when there are no industries to absorb them?—A. Most of the indigenous enterprises recently started collapsed on account of the want of proper men to conduct the business, and therefore I say that the right type of men is absolutely necessary.

Q. The whole question comes back to what is proper training. If for instance these Swadeshi enterprises, which failed in such great numbers, were able to find students trained in a commercial college or technical institution, do you think they would have been more successful than they were?—A. I believe so.

Q. The whole thing comes back to what is proper training and if we assume that many of the boys from the colleges had a fairly good college training, and if they were not able to obtain employment, is it then fair to assume that college training is not sufficient?—A. Theoretical training is of no use unless it is assisted by practical training in workshops.

Q. Is it not a better plan to begin your industries and to get your boys trained in the workshops and then provide technical training facilities for them?—A. This is a matter in which there are different opinions and it is very difficult to formulate any particular plan.

Q. We have a certain number of industries. Should we not proceed and develop from them boys who will go into these industrial workshops and then provide facilities for their obtaining higher technological training. That will be a training following, but not very much behind, industrial development?—A. In a manner simultaneously. In my opinion we must give commercial training first, some sort of training before the industry is developed. You must admit that there is a cry everywhere for commercial colleges and for technological colleges. People are no longer satisfied with literary pursuits.

Q. We do not listen to cries of that kind unless they are justified. It seems to me that there has been a tendency in many countries to suit your education to what the student wants instead of giving the student what you know he ought to have. The question now is which to have first—the commercial training or the industrial development?—A. Whether industrial development follows or precedes commercial training, I think the training received in technical colleges must be combined with practical experience in the workshops. Otherwise he cannot properly conduct an industry.

Q. This training must be accompanied by practical training and then we might have the industries established?—A. There are a number of established industries in this country and they can very well provide practical training.

Hon'ble Pandit M. M. Malaviya.—Q. You say that the proper commercial training combined with practical work will make one a man of business. Do you mean to say that if there is a man with a commercial training he will be able to examine the possibilities of a particular business and if he finds that business is likely to be able to pay he can then engage the necessary expert advice so far as the technical part is concerned?—A. Mere theoretical knowledge will not be of any use. He must have practical experience in the workshops. He will then be able to advise what sort of work should be carried on and whether there is any possibility for any particular industry.

Q. With reference to commercial training do you mean to say that so far as commerce is concerned you require a college of commerce in order that young men should receive proper commercial education so that they should be able to take more and more of the import and export trade in their own hands?—A. Exactly so.

Q. If you have a college of commerce, which will impart a sound business knowledge of banking, do you think that after a few years of experience these men will be able to manage banks satisfactorily?—A. Provided they begin from the lowest rung of the ladder and acquire the necessary experience.

Q. In addition to this you want industrial and technical education provided in order that the technical side of a business should be understood?—A. Exactly.

Q. You say that several banks would not give financial assistance to Indian managed companies however much the security advanced may be. Which banks do you refer to?—A. I do not remember of any particular bank and even if I knew I would not like to say. That is the general impression.

Q. You say that it is a painful fact that indigenous enterprises do not receive financial assistance from banks. Does the Presidency Bank also come under this category?—A. I do not like to say.

Q. With reference to the proposed industrial bank, do you think that the Government should assist it in any way?—A. Government should patronise it by subscribing a portion of the capital, whatever that portion may be.

Q. Or by guaranteeing interest for a certain number of years?—A. Yes. That is one of the best methods.

Q. If Government guaranteed interest for, say 10 years, do you think that private capital would come in?—A. I think that would be a great stimulus.

Q. You say that Government aided factories should be required to take in apprentices, etc. Do you think it will be necessary to undertake legislation for that purpose? If Government exerted their moral pressure firmly, would not the object be attained?—A. It would.

Q. And particularly in the case of railways under State management, there can be no difficulty?—A. There can be no difficulty.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Are you associated with the Indian Industrial Association which sends boys to foreign countries?—A. I pay some subscription at the yearly meeting of the Association. My connection with it is very little.

Q. Do the boys who return obtain good employment?—A. I enquired about it and I think that most of them got employment either in British India or in the Native States.

Q. So you think there is a scope here for a technical or an industrial school?—A. Undoubtedly. There is great scope.

Q. With reference to banking do you think that any bank will give you money without being satisfied that you will make profits?—A. At least it is quite unsafe so far as private individuals are concerned.

Q. If an industrial bank is started will it be able to advance money to enterprises after taking expert advice?—A. That should be the function of the industrial bank.

Q. You speak about the labour conditions in Java. Do you know anything about the labour conditions there?—A. I do not know, I know that in the beginning Government purchased the machinery and the whole thing was placed in the hands of private individuals.

Q. As regards the Board of Industries do you wish to have it elected or nominated?—A. I think that would be a good idea.

Q. Do you think that the capitalist can invest the money safely on the security of land or on the produce of the country?—A. They do it.

Q. What rate of interest?—A. 6, 7 and 8 per cent.

Q. If any industry which is making 10 to 15 per cent. profits asks for more capital would it be attracted?—A. Yes.

President.—Q. With reference to the sugar industry in Java you say that the success is solely and wholly due to the fact that Government assisted in the enterprise. Where did you get the information?—A. I read in Ranade's book. That was in the beginning. Whether it is so now or not I cannot say. I do not know about the present conditions.

Q. There must be some other cause besides Government assistance. We do not find that Government are doing anything at present?—A. Now the industry is in the hands of big capitalists.

Q. It would not therefore be correct to say that the success was solely and wholly due to the fact that Government started pioneer factories?—A. That is what they did in the beginning.

Q. Do you mean that without that initial support the enterprise would not have succeeded?—A. Yes.

Q. There must have been other causes also at work?—A. That may be so. I have no present information on the subject.

Sir D. J. Tata.—Q. You say that it is a painful fact that industries under indigenous management do not receive the necessary banking facilities. Would you be in a position to state any particular industry which applied for help and which was refused?—A. I can give you the example of the Bengal Laxmi Cotton Mills.

Q. Is there any inherent reason in the industry which made the bank to refuse, or was the refusal simply due to the fact that the bank did not want to support any indigenous industry?—A. I cannot formulate an opinion.

Q. Did they refuse it because it was an Indian industry?—A. They did not say it in so many words.

Q. They must have had some reason for the refusal?—A. I do not know what their real reason was.

Q. What do the other firms which have been able to get the money offer, which the mills were not able to offer?—A. I do not know.

Q. This statement "that the existing banks refuse to give facilities to industries under indigenous management," is made by a number of people, and I want to know whether there is any real foundation for it?—A. It is not absolutely devoid of foundation.

Q. You admit there might be good reasons for refusal?—A. There may be. But it is a fact that when indigenous enterprises asked for help they have invariably refused.

Q. You say that it is a painful fact. Is it merely a matter of belief; or is there anything substantial about it?—A. I cannot say. It is the general impression.

President.—Q. The banks are established for business. They have no national prejudice. If the bank advanced money on the machinery, it could not readily recover the money and it is dangerous to saddle the bank with a lot of machinery which may be unsaleable when there is a run on the bank. The banks would do business with anybody, irrespective of whether the concerns were Indian or otherwise if there was safety for the money. In a country like this there must be more Indian concerns than English concerns and the banks would find it profitable to advance money if they could safely do so. The English firms have established a reputation and so there is confidence in them, whereas the same cannot be said of many new Indian concerns. Don't you think that the prejudice may have had its origin in that way and that a wrong inference may have been drawn. We have three distinguished members of the Indian commercial community in the Commission and they would not say that they find it difficult to get money if they wanted to get it. May I understand you to mean that in a similar set of circumstances, the same security being offered by an European firm, they would have been able to get the money whereas an Indian firm would not?—A. It is not possible to answer that question.

Q. If you are not inclined to answer the question I do not want to press the point?—A. It would be impossible to answer the question.

Q. Is it fair then to retain this sentence in your statement if you cannot answer the question?—A. I think it should remain. It is the general experience of this part of Bengal.

Q. There are more cases of Indians being refused than English firms being refused. Is it correct to say that the bank only refuses because it is an Indian concern apart from the merits of the case?—A. I cannot say. But everyone knows in Bengal that financial assistance is invariably refused to indigenous concerns.

Q. Would you as a financier be prepared to advance money to the Bengal Laxmi Cotton Mills?—A. I would not hesitate.

Sir D. J. Tata.—Q. If it is a fact that banks refuse the giving of money because they are Indian concerns and for no other reason, then that is a matter which the Commission ought to take notice of. With reference to industrial development and commercial training I believe your idea is this. If our young men went and qualified themselves and got theoretical knowledge, that alone would not be sufficient, and they would not be qualified to take charge of any actual business; but if they did some practical work with some industrial concern they would be able to manage the concern at no distant date?—A. My idea is that he must have some practical experience first.

Q. When you say that practical education must precede industry that means that before anybody is qualified to conduct an industry he must get a theoretical knowledge combined with a practical knowledge; is that what you mean?—A. Yes.

Q. Don't you think that the ideal condition will be to make it more or less a family affair. For instance take the sugar business. If the young people belonging to the family that has been engaged in the sugar business were sent out for training and if they applied themselves after their return to the family business beginning from the bottom and going through all the processes, don't you think that would be the ideal condition?—A. That is the ideal condition. But it is not the sons of business men alone that may be sent out but others may also be sent out and they may be made to receive practical as well as theoretical training.

Q. We can advance our industries only if those who are connected with industries train up their children so as to be able to carry them on on a systematic and scientific scale?—A. That would be preferable.

WITNESS No. 120.

Mr. A. C.
Banerjee.

MR. A. C. BANERJEE, *Honorary Secretary, Indian Mining Federation, representing the Bengal National Chamber of Commerce, Calcutta.*

WRITTEN EVIDENCE.

Capital.

In conducting some collieries and in floating joint-stock companies I have personal experience of raising capital. As Honorary Secretary to the Indian Mining Federation I frequently come in contact with others engaged in and attempting industrial enterprises. Our difficulties in raising capital are very great. The capital which has accumulated to some extent in the hands of a few families is being mainly employed in financing the people engaged principally in trades like rice, jute, etc., which require a very large amount of money and also in advancing loans on landed properties which offer good securities. Industrial enterprises are getting support from the middle classes. But their resources are limited and it is often the case that the nominal capital and the paid-up capital of a concern differ very largely and that a call for the unpaid amount is hardly responded to, coupled with this the difficulty in getting loans makes the situation most uncongenial for industrial enterprise.

As for the mining industry the banks generally do not give loans on the security of our colliery properties however substantial they may be. With the private capitalists our properties have little value. The small collieries are sometimes put to such straits that they have to borrow at a rate of interest varying from 36 to 84 per cent. annually. The case of joint-stock companies, if not as bad, is not much better.

Those who subscribe to joint-stock companies, expect a dividend immediately and as they cannot get it generally in a year or two no substantial portion of the unpaid capital can then be raised. The result is that the concerns suffer heavily for want of funds and some of them collapse. If the Government would guarantee dividends for a limited period in favour of suitable industries, some amount of capital which now remains blocked or is invested for unproductive purposes will most likely be available for industrial purposes.

Government
assistance.

It is a matter for great satisfaction that Government is now taking an active interest for the development of industries in India. To attain that end Government will have to make sustained efforts and to take action in different directions. Of the lines of action indicated I fully approve the following and earnestly appeal to Government to take measures in those directions :—

- (1) To make adequate provision for technical training by establishing technological colleges and industrial schools, so that there may be a sufficient supply of skilled operatives and expert factory managers and supervisors successfully to conduct industrial enterprises.
- (2) To establish commercial colleges in suitable centres with provision for a term of apprenticeship for the students in suitable business firms, so that competent men may be easily available for properly managing or assisting the management of commercial and industrial firms.
- (3) To make research arrangements in a thorough and comprehensive scale and to make such organisation readily and easily available to industrial enterprises and to the public.

- (4) To make arrangements for establishment of properly organised commercial museums in commercial and industrial centres. The development of different articles from the state of raw materials to finished products should be shown in the museums and wherever deemed profitable the process of development of similar foreign articles should be shown for guidance.
- (5) To guarantee dividends for a limited period with the object of drawing in capital for industrial purposes. It is reasonable and desirable to make provision for refund of the expenditure incurred in paying dividends at the guaranteed rate, when a concern has begun to show a large profit.
- (6) To grant loans to industrial enterprises generally with interest at a moderate rate and on easy terms.
- (7) To help suitable industries with bounties and subsidies.
- (8) To help industries with their credit to obtain machineries on the hire-purchase system.
- (9) To help an industry by guaranteeing purchase of products for a period sufficiently long to help it to grow self-supporting without such aid.
- (10) To afford adequate transport facilities by railways and waterways.
- (11) To regulate the rate of freight of railways in a way as would be favourable for the industrial development of the country.
- (12) To establish industrial banks all over the country in suitable commercial centres, each provincial group having a central bank in the provincial town. The object of these banks should be to grant loans to and stand guarantee for industrial enterprises on proper security of their stock-in-trade and other properties and also to help the marketing of their products and to grant loans, with discretion, to industrial co-operative societies.

For the proper conduct of the commercial and industrial branch of the administration I am of opinion that it is desirable and necessary to appoint in every province a Board of Industries consisting of representatives of industries and commerce of the province with a competent business man at its head as Director of Industries. The Boards should at first be advisory. It may be later on desirable to make them executive bodies with funds at their disposal. Their present duty should be to help the development of existing industries and the growth of new ones and to advise Government regarding measures that should be undertaken for the purpose. Provincial commercial organisation.

The Director of Industries should be in constant touch with the people conducting industrial enterprises and render all possible assistance in removing their difficulties and helping them to develop the industries, examine all applications for Government aid to industrial enterprises. In short he and the Board should actively co-operate for the development of industries in the province and determine for Government the lines of action it should take for the purpose.

There is hardly any necessity, at least for the present, for establishing any elaborate Imperial Department of Industries. The object of correlation of the industrial works in different provinces may be attained by interchange of ideas and informations amongst the different provincial organisations and by holding periodical conferences. The Minister of Commerce and Industry will, as a matter of course, exercise necessary administrative control.

Co-operative societies, if properly organised and guided, will, I believe, very materially improve the condition of the masses. At present the condition of the lower classes of people are far from what it ought to be. Though they generally live an honest life and are regular in habits, their credit, on account of their poverty, is very low. They have often to borrow money and that at an exorbitant rate of interest, which places them entirely in the hands of the village money-lenders. Cottage industries cannot be developed to any large extent unless the people can get financial help, in the shape of loans, at a moderate rate of interest. This can only be done by organising co-operative industrial societies. The object of those societies should be to render financial help to their members for productive purposes and use their credit in the interest of their members, to obtain necessities of the industries in which their members are engaged, and also to organise the sale of the manufactures of the members. Co-operative societies.

These societies should be helped with loans by the industrial banks proposed above.

So far as the agriculture and mineral resources are concerned, it is absolutely necessary that surveys should be organised on a comprehensive scale. Though the country is generally and largely agricultural, it is curious that even the properties of the soil of different tracts are not known. For want of a thorough geological survey and proper guidance as to the mineral resources of the country haphazard adventures are being made. The gold and black-lead mining enterprises in Hazaribagh may be cited as illustrations. Industrial surveys.

The survey work and the research work which have been done here and their result generally remain unknown to the people. It is absolutely necessary that Indians should be largely associated in these survey and research works and their reports and results should be

popularised by supplying them free to all commercial and industrial associations and making them available to the public at a nominal price.

It will also be of very great help to industries if a Gazetteer be published giving under proper heads references of all surveys done, all researches made whether here or abroad on Indian subjects and all monographs and bulletins published.

Training of labour
and supervision.

I have observed most satisfactory results following training of apprentices in factories and workshops. Under the present arrangement the apprentices have to pick up their information and to get what they can by humouring the managers and the foremen. If the system of apprenticeship be well organised with provision for Government supervision and guidance great results will follow. It is also necessary that provision should be made safeguarding the interest of factories taking apprentices.

No great industrial development is possible here unless properly organised technological institutes be established in suitable number and in suitable places for the proper training of young men for the post of foremen and supervisors of industrial enterprises. What we most lack is skilled foremen. Industrial schools should be started in large numbers to give an industrial training to a portion of the youth of the country. Each local school should, while adopting its curriculum, have an eye to the requirements of the locality. An industrial section may be added to the existing high and middle English schools of the country.

Government should also help the deserving scholars of the technological institutes and also competent factory-managers, supervisors and the like of suitable industries with scholarships to study condition and methods of other countries.

Difficulties in the
way of development
of mining,
railways.

We experience great difficulty in getting railway sidings. Though there is provision for 3 per cent. guarantee on the outlay against the colliery concerned, the railways will not give sidings unless they are convinced beyond doubt that they will make substantial profit by so doing. On account of this large coal-fields in the Ranigunj District, such as the neighbourhood of Pandeweshwar and Panchra stations on the Ondal-Sainthia line, East Indian Railway, remain untapped. This difficulty should be removed.

We have no waterways running from one end of the country to the other. The railways therefore are generally the means of internal transport. The coal-fields are mostly in Bengal and Bihar. So the coal freight, at the existing rate, to such distances, as Bombay and Punjab, becomes very considerable and operates against the industries of those places. It is necessary to make the fuel cheaper for those places and with that view the railway freight of coal should be regulated.

I am engaged in the mining industry. For its further development I would suggest:—

Measures for deve-
loping mining indus-
try.

(1) A comprehensive geological survey indicating as fully as possible the mineral resources of the country; (2) adequate transport facilities; (3) the establishment of industrial banks for reasons stated before; and (4) active help from Government.

Industries for
which India is suited.

India abounds in the raw materials of various industries and is a principal source of supply to several manufacturing countries abroad. Most of the industries which use them can be developed here. I am glad Government is making an earnest effort to develop the sugar industry. Besides that, I think the industries of steel works, hardwares, chemicals, alcohol, vegetable oils, leather manufacture, salt and matches admit of immediate and considerable development in this country.

ORAL EVIDENCE, 7TH DECEMBER 1916.

Mr. C. E. Low.—Q. You refer to the difficulty of getting loans on the security of collieries. Do you refer to large colliery companies or do you refer to the small colliery owner who does not work regularly?—A. I refer to both.

Q. Do you consider that a European company of the same size and in the same position would be able to obtain a loan?—A. I believe so.

Q. You are not prepared to back up your statement by quoting actual instances?—A. Such cases are numerous, but I do not think I would be wise in declaring them publicly.

Q. You suggest that the different stages in the manufacture of the article might be shown in the commercial museum. That postulates a different idea of commercial museums altogether. The present museums are not so much for instruction as for providing a means of advertisement. Don't you think that what you propose could be more profitably done in a technological institution where it might assist industrial students as well as the industrial public?—A. It would be so.

Q. With reference to what you say about the industrial surveys and what the Geological Survey ought to do, don't you think that you are asking the department to go beyond its present constituted functions?—A. The records of the Geological Survey that we have at present do not exactly shew where particular minerals are available so as to make it commercially successful to take it up.

Q. You say that you have observed satisfactory results following training of apprentices in factories and workshops? Have you any cases in mind?—A. While I was at Delhi I had a relative of mine placed in a weaving mill; he was admitted as an apprentice and afterwards

when I came away he was sent to Jalgaon and he has picked up weaving now and he is getting Rs. 200 in a mill there. He has passed the matriculation only.

Q. You say that if the system of apprenticeship be well organised with provision for Government supervision great results will follow? Do you contemplate Government providing for its organisation? Have you any definite ideas as how that should be done. The point has been raised by other witnesses and we regard it as one of importance?—A. What I mean is that the boy is at present left to the sweet will of the manager and he has to depend on the good humour of the manager. If for example there is a Government Inspector who goes round the different mills, the mill manager will understand that he has a duty towards these apprentices and give them proper training. The Inspector will make a report to the educational or whatever department it may be.

Q. Don't you think that anything of the kind will make the mill managers reluctant to take apprentices instead of taking them in larger numbers. What should the Government do to add to the inducement of the managers?—A. Matters can be much improved if the Government and the people work harmoniously. We in the collieries do not object to take apprentices. We do not object to examination by the Inspector.

Q. Have you any suggestions as to how that should be done. Would you make it compulsory for all factories to take apprentices or would you only offer inducements?—A. If the mill managers would not take them and the apprentices are left to the sweet will of the managers I would make it compulsory because I want the men to be trained.

Q. In England they have to pay a premium?—A. That is a good idea. We could have it here as well.

Q. Do you think people will pay?—A. In our factory we give them Board and Lodging. In the case of some we had to refuse because we could not. They agreed to make their own arrangements. In the same way if they were asked a premium I think they will be willing to pay. We might have a regular agreement for a certain number of years. The idea is to have a systematic training at the factories and mills.

Q. Could you get anybody to pay?—A. I think even if an agreement were demanded they would be willing to come.

Q. Have you any further suggestions to offer as to what inducement Government might provide to the mills to take apprentices?—A. Stipends might be given to pupils showing the best results.

Q. How will that appeal to the mill? Is there any way by which Government can bring inducement to bear on the mill rather than compulsion?—A. I have never thought of the subject. If necessary that can be worked out between the mill owners and the Government.

President.—Q. The Geological Survey can indicate the mineral resources of a particular district in general terms, but they cannot show you how much gold there is in any particular place? Have you read the reports of the gold prospecting in the Chota Nagpur published by the Geological Survey?—A. No. This I have written with special reference to graphite, because one of my friends purchased some villages in the Hazaribagh district. He could not know in what particular place graphite could be found and after spending nearly 15 to 20 thousand rupees and making trial pits, he succeeded in locating the place and now he is making it a profitable concern. Why I am saying this is, is it not possible to have a record of the exact mineral resources of the country so that one can easily find out whether they could be taken up with success as a commercial proposition.

Hon'ble Pandit M. M. Malaviya.—Q. With reference to industrial banks do you think that if the Government guaranteed interest on shares held in the bank, people will be willing to come forward to invest money in it?—A. Yes.

That would inspire sufficient confidence Government guarantee always inspires confidence. If Government guarantees interest, say, for a period of ten years, and if during that time the bank has acquired sufficient stability, then the people will come to invest money.

Q. About the failures of the banks that you have referred to, do you think that they would not have failed if they had received some assistance from some bigger banks or from Government?—A. If they had received help from the bigger banks they would not have failed.

Q. You are aware that in England and Germany and America, when there has been a banking crisis, the bigger banks have assisted the smaller banks and the State treasury has also assisted them particularly in America, to tide over the difficulty?—A. Yes.

Q. If you had an industrial bank with Government guarantee, there would be no doubt about their stability?—A. Yes.

Hon'ble Sir Fazlulhoy Currimbhoy.—Q. Do you mean to say that Government should compel private mills to take apprentices?—A. I do not exactly mean that there should be compulsion. But there should be some regular system and understanding for taking apprentices.

Q. Supposing they do not want to take them? How can the Government compel the people of the country. If they are not willing to take how can the Government compel? If there were technical institutes, do you not think they would have better opportunities?—A. No. I do not think so.

Q. The mills generally do not take men because they have a lot of business secrets and they do not want an outsider to get to know them and then go and make them public. You

must have some trust and control over the man. A contract is no good. If I do not want to work I can misbehave myself and take the opportunity of going away. Have the collieries many business secrets?—A. The collieries have got their own secrets as well as the mills. Every trade has its own business secrets which cannot be divulged.

Q. You won't take a man whom you do not trust?—A. I would not take him.

Q. You don't want the Government to force the man on the mills?—A. What I mean is there should be some understanding.

WITNESS No. 121.

Mr. G. S.
Henderson.

Mr. G. S. Henderson, Imperial Agriculturist, Pusa.

WRITTEN EVIDENCE.

My experience is confined to Sind and the following statement is based on nine years' residence as Deputy Director of Agriculture in that province.

Sind is a large country with a small population and only a small proportion of the available land is cultivated and the cultivated land itself is only cropped once in 3 or 4 years with the exception of the rice area. Consequently there are few industrial enterprises and even agriculture suffers from want of labour. The country is the hottest in India and is unhealthy. Only two classes of emigrants will come into the country—Punjabees and Marwaries. The latter include Tharies and Cutchies, inhabitants of the huge deserts which surround Sind. Only the pressure of famine forces them into Sind where they can earn good wages and if any rain falls in the desert they return home in large bodies at a day's notice. Rs. 15 per month is often paid for a coolie who would be considered dear in Bihar at Rs. 4.

Practically the only industrial enterprises are concerned with preparing agricultural products for marketing, i.e., rice husking and cotton ginning and pressing. Rice and cotton are the chief export products of Sind. Karachi has a large export trade in wheat and oilseed but these come from the Punjab and United Provinces, this applies to a large extent also to hides and bones.

Rice.—There are rice hulling and boiling plants at every railway station in Sind which is near a rice district. The plant is generally good but badly kept and often driven by portable engines. There is plenty of capital available for the erection of such machinery. They belong to 'banias' who frequently lend money on the growing crop of rice. There is no lack of rice hullers, in some towns the work is pooled, but this is not common. Rice is usually exported up the Persian Gulf, to Aden, and to the African coast as far south as Zanzibar, mostly in country craft.

Wheat milling.—One large up-to-date flour mill was lately erected at Shikarpore in Upper Sind by a Punjabee banking syndicate. It was only working half shift owing to failure of a number of Indian banks. Two smaller mills are in Larkana, they are well run and belong to banias. The wheat for most of these mills comes from the Punjab. There are also a number of mills in Karachi some of which are run by European capital.

Cotton ginning and pressing.—Cotton growing has increased very rapidly in Sind of late years. It started in Hyderabad and is most largely grown there, and in Nawabshah and Thar and Parkar districts, it will eventually be cultivated in Upper Sind as the cultivation is gradually creeping up both sides of the Indus. It is largely an irrigation matter, when the water supply is suitable it can be grown on any canal in Sind. The Sindhi prefers rice cultivation when he can get sufficient water but even so, cotton has put rice out in large areas of the Eastern Nara canal. Cotton is the great ready money crop. If the production is put at 200,000 bales value Rs. 100 each, it will be seen what the crop represents to a poor country. There are various schemes for substituting perennial canals for existing inundation canals and building a barrage across the Indus at Sukker to ensure a constant supply of irrigation water in the cold weather. By the improvement of existing irrigation systems cotton cultivation will be increased and the general industrial and agricultural state of the country put on a higher level. Irrigation improvement outweighs every thing else, and is the most promising field of Government activity.

Cotton trade.—Cotton growers sell outright to the gin owners. The chief seats of the ginning industry are at Mirpurkhas, Hyderabad, Tando Adam and Shahdadpur. There are hydraulic presses also at these places. A number of the gins belong to the 'banias' who frequently lend money on the growing crop. The 'bania' owners sell eventually to the export firms like Ralli and Volkhart. There is plenty of capital available for the erection of gins and new ones are constantly being erected, in especial, at stations of the new light railways through the cotton areas. Messrs. Ralli have a gin and press with a capacity of 40,000 bales at Mirpurkhas. This firm fixes the price of cotton daily and the factory managers are not allowed to pay more or less than the fixed price for cotton brought to the factory, with allowance of course for dust and discoloration.

It is currently believed that the policy of this firm is to avoid speculation in cotton and whatever is bought in Sind is sold simultaneously in Liverpool. They have agents in the cotton villages and their crop estimates are numerous and reliable. Platt's double-knife gins are invariably used and the cotton seed is all exported.

Hydraulic presses being very expensive are not so widespread as the gins, but there are more than sufficient for the work. The presses were in a pool sometime ago and a number were idle but the pool broke down.

New crops.—It is now well established that before any new export crop can be given out for general cultivation in a district, some arrangement must be made for the sale and disposal. Good varieties of American cotton were found to grow well, the yields were satisfactory and there were no inherent difficulties in the cultivation. Samples were graded as "Middling" American but it was found that the local trade would only give a small premium over Sindhi cotton and in some cases refused to touch small quantities. The Bombay Mill-owners' Association took the matter up and sites being supplied by Government erected two small gins, one at Mirpurkhas and the other at Shikarpore, and agreed to buy Sind-American cotton, according to the current quotation of American cotton in Liverpool. After two years' working it was found that a reorganisation was necessary as the following details were found to be unsatisfactory:

I. Agents sent up had no experience of Sind and did not know the language or customs, consequently considerable friction arose with the growers.

II. Roller gins were installed against the advice of the Agricultural Department instead of American saw gins.

III. Gin in Upper Sind was a failure, it could not get sufficient cotton owing to two bad seasons with late irrigation water in the canals.

IV. Local firms bought American cotton in opposition to the syndicate and the supply was limited. In one year some 500 bales were bought and ginned by the syndicate (of excellent quality) but great difficulty was found in keeping the seed unmixed with local Sindhi cotton seed. Even when good pure American seed is sown, roots in the soil of a former Sindhi cotton crop spring up and cause admixture. The factory is still running and it remains to be seen if it is going to put the growing of American cotton in Sind on a commercial basis.

Export crops.—Government intervention in the case of export crops is considered necessary in many countries and has done much to raise the standard and uniformity of export production, i.e., wheat in Canada and fruit and dairy produce in Australia. Indian white wheat is exported under an allowance of 2—2½ per cent. dust (and 40 per cent. red wheat). It also contains barley and oilseeds as an impurity. Finally, it is all shipped in bags which are ripped open on arrival at a European port. This state of affairs would be obviated by the erection of wheat elevators and establishing legal Government grades. At present there is no object in producing clean wheat in India as the buyer would add the trade allowance of dirt before shipping. Small parcels of clean wheat would probably not be looked at by the trade at home.

Seed farms.—Grants of Government land on easy terms to properly experienced and properly financed individuals or syndicates for seed farms, as has been done in the Punjab, would be of advantage. Non-export crops need no special Government intervention. In the normal course of work, by itinerant instructors, agricultural shows and demonstration plots, the various provincial Agricultural Departments bring recent improvements to the notice of the cultivators.

Agricultural schools.—A beginning was made in Sind for the training of young land owners by starting a vernacular agricultural school at the Mirpurkhas Government farm. Ten boys about 17—20 years old had an annual course, the mornings were spent in practical work on the farm with lectures in the afternoons. The work was in Sindhi and the main object of the work was to show practically what improved methods, implements and crops were suitable for adoption in ordinary Sind agriculture.

Railway construction.—The country is well served with main lines and 3 light railways have been built and are in operation. They are about 40 miles long and link up important agricultural areas with the main lines. No less than 7 new lines are under projection as private enterprises and the capital is always over-subscribed. The first light lines are paying 12 per cent. interest.

Research abroad.—is of the utmost value and the Government experts should be encouraged to travel in tropical and other countries. This prevents the work and activities of any department getting hidebound and introduces new ideas of great value. Personally I have found a previous residence in Egypt of great benefit as also a tour in the cotton states of the United States of America.

The Imperial Institute of London is of value as the authorities are in touch with the various trades and they are always willing to send valuable valuations and reports on new economic products.

General conditions.—On the whole the Sindhi cultivator is not badly off. He makes a living without particularly hard work. The fear of famine is never before him, at the worst only a shortage of canal water. A cultivator and his family are said to need 5 cows to keep them in milk, so they are better fed than in most parts of India. There is plenty of capital in the country and if Government money is available for irrigation work in sufficient quantity, local industries have no need of any special adventitious aid.

ORAL EVIDENCE, 8TH DECEMBER 1916.

President.—Q. You were Deputy Director of Agriculture in Sind?—A. Yes.

Q. Have you now been transferred to Pusa?—A. Only temporarily for a year.

Q. What are you doing specifically at Pusa?—A. Managing the Pusa farm.

Q. How long have you been at Pusa?—A. Five months.

Q. Have you looked into the question which has been raised by Mr. Howard about aeration of the soil and the system which he has adopted for entrapping new silt and building up on the previously existing soil?—A. No. I have not gone into it fully. I have read his views on the subject.

Q. Are you a soil expert?—A. To a certain extent.

Q. It is more properly your function than, for instance, that of the Economic Botanist?—A. I think it would be.

Q. Have you not followed this research for him?—A. No. I cannot say I have.

Q. I do not understand what system of Government there is at Pusa that allows a botanist to carry on research in soil whilst you as agriculturist take only a passing interest in the matter?—A. So far as I am aware Mr. Howard has not worked his theory out on a practical basis, and when he does we will try it on a practical scale on the farm.

Q. If it is a theory worth considering and worth testing, surely it is a problem that ought to be handed over to an appropriate specialist and not to be followed up by an economic botanist?—A. He would probably work it out more fully and hand it over later on.

Q. Have you got any means of having a matter of this kind discussed in a Council so that you can decide as to who is the appropriate specialist to undertake such researches?—A. We have got a Council at Pusa.

Q. Has this question been before the Council?—A. No.

Q. If there is anything in the idea at all, if he has got as he says definite results, it seems to me it would be better for a soil specialist to take over the work from him and go on with it. He has not consulted you?—A. He has not done so far.

Mr. C. E. Low.—Q. When a problem of that sort taken up by a member of the staff rather outside his own line reaches a stage at which it has been demonstrated outside the college on lands belonging to other persons, don't you think that before that happens it ought to be considered in Council and handed over to the member of the staff more particularly responsible for that kind of work?—A. Yes. Certainly I think it would be better.

Hon'ble Pandit M. M. Malaviya.—Q. Is there not some advantage in allowing the gentleman who has taken interest in the particular question at Pusa and who has thought of it to work it out in his own way and then present the results to the Council?—A. I think his idea will probably be to work it out till he gets it on a fairly big scale, and then to hand it over.

Q. Possibly in the earlier stages it may not commend itself to the particular gentleman to whose department it is to go?—A. The agricultural section would take it at once as soon as it is requested to do so. Until he has had it on a fairly big scale probably he does not want to test it on the farm.

President.—Q. It has already been applied to land outside the Pusa farm?—A. Only on a very limited scale, I think.

Q. I do not understand why it is applied outside in any way by an officer or at the instance of an officer who is not necessarily a soil specialist. As Economic Botanist he ought to be a better botanist than a soil specialist. He is spending time over work of that kind which a soil specialist will do more quickly and thoroughly?—A. No proposal has been so far put to my section. If Mr. Howard wants it to be introduced into the farm he will bring it to the Council and then a scheme will be made and it will be tried on the farm.

Q. It would be his business to bring the matter to the notice of the Council?—A. Yes.

Q. And no other officer's business to interfere with it?—A. If the director liked to take it up he might put it before the Council, but no one but the director or Mr. Howard could bring it up.

Mr. C. E. Low.—Q. What was your agricultural training before you left England?—A. In England I was in the Glasgow University and in the Glasgow Agricultural College.

Q. Had you any practical experience in farming in the United Kingdom?—A. Yes. I have been on farms practically all my life.

Q. How long were you in Egypt?—A. About three years.

Q. And you find your Egyptian experience of value here?—A. It was of the greatest value in Sind.

Q. It enabled you, of course, to introduce *Trifolium Alexandrinum* in this country?—A. Yes.

Q. You find it a good fodder crop in Sind?—A. It is of very great advantage especially when introduced with Egyptian cotton growing.

Q. You consider free yielding green fodder crops suitable and important with reference to the local needs?—A. It is of the greatest importance.

Q. Turning to the question of cotton, what cotton are you growing in Sind?—A. American Mississippi valley cotton.

Q. Is it medium?—A. It is a long stapled Mississippi valley cotton.

Q. Does the cultivator who grows that crop get a greater profit under the existing conditions than from other crops?—A. It depends a lot on the price, because the ratio between desi cotton and American cotton varies immensely.

Q. Are you able to secure a price which enables him to grow this at a tempting profit?—A. For the last few years we have got very good prices indeed.

Q. You consider that the amount of cotton now produced in Sind is such as to give a reasonably free market?—A. It will probably be amalgamated with the Punjab American cotton. With the combined crop there will be sufficient to put it on a commercial basis.

Q. How many bales did you turn out in Sind when you left?—A. About 700 or 800.

Q. Have you experienced any difficulty in getting cotton put on to the market in an unmixed condition?—A. Considerable difficulty.

Q. What means have you adopted to overcome that difficulty?—A. We have a touring staff who inspect all the cotton growing places and get cultivators to rogue it.

Q. You are aware that other people mix it afterwards?—A. Yes.

Q. You find it is mixed between the time it leaves the farm and the time it gets into the hand of the ultimate purchaser?—A. The great trouble with the mixture is supplying seed. The seed is mixed.

Q. Was there not subsequent mixing by dealers?—A. I do not think much.

Q. Is that not perhaps the case because the quantity is comparatively small, and is there not danger of that condition coming into being when you get a larger quantity?—A. The buyers are able to look after that. There is a very big difference between American and desi cotton.

Q. You are well aware that the same thing occurred in Madras in respect of Cambodia cotton?—A. There is also deterioration as well as mixing.

Q. There was admixture by dealers?—A. I suppose there was.

Q. Did cultivators agree to have their fields rogued?—A. Some of them did. But in the case of annual tenants some difficulties arose. The zamindars had not full authority over their own land.

Q. You got the influence of the zamindars on your side?—A. The zamindars as a rule are quite keen about it, but they have to deal with their annual tenants.

Q. Sind is not a suitable field for co-operative organisation?—A. It is one of the worst fields in India.

Q. Do you think that when you get a larger area under American cotton the danger of admixture by dealers would be a serious one?—A. I think buyers will be able to take steps to prevent that.

Q. You think that big buyers would go into the field fairly early and would be able to control the situation in a few years?—A. Yes.

Q. Are buyers at present giving prices which make it worth the while of the cultivator to grow American cotton rather than the local?—A. Prices are phenomenally high.

Q. The price of Indian descriptions are considerably below what they used to be comparatively?—A. There is a very high ratio between the price of desi and Sind-Punjab American grown cotton.

Q. You remember the year 1912 when the price of Indian cotton was relatively very high compared to American?—A. Yes.

Q. Had you any difficulty that year?—A. That ratio did not keep the whole year. At the beginning the ratio was much wider and latterly it narrowed, but most of the American cotton was sold fairly early.

Q. As regards saw-gins how did you get people to take up saw-gins?—A. I started a saw-gin in one of the Government farms and we turned out very much better samples than with roller gins.

Q. You have difficulty in the distribution of your seed?—A. At the beginning there was a lot of difficulty on account of admixture.

Q. How did you manage to get out enough seed of the right kind unmixed to make it a big economic proposition?—A. We got the best sample selected on the field and bought the kapas from the men and superintended the ginning. There is a certain amount of mixture in the gin. Some seed of the cotton which has been ginned before remains in the gin and there is mixture.

Q. Do you find it necessary and advisable to start small gins worked by oil engines and owned by zamindars to secure pure seed supply?—A. In time to come it will be necessary to start at least one big central gin.

Q. You say the Punjab was growing a slightly different type of cotton. Are you keeping in touch with what they are doing in the Punjab?—A. I went up lately to the Punjab myself. When I was in the Bombay Department I had no connection with the Punjab.

Q. But the Directors and Deputy Directors of many provinces do correspond direct on subjects of common interest?—A. At that time they had hardly started in the Punjab.

Q. Do you think it would be more advantageous to grow the same type of cotton in Sind and the Punjab, for marketing and exchange of seed and the supply of each other's deficiencies in case of trouble?—A. I am afraid it would not do because the climate is quite different. A couple of months extra growing period in Sind is obtained, because it does not get cold so early.

Q. Do you think that more would be gained by a freer intercommunication of ideas between the different provinces?—A. I think it would. You have not got very much time for touring in other provinces. If you have got one province of the size of Sind it is big enough for one man.

Q. What is your staff?—A. When I started in 1907 there was no staff at all.

Q. Do you find your Sindhi eager to go to Poona and get educated?—A. No. They are not eager.

Q. What staff did you have when you left?—A. I had one Divisional Inspector and five central farms with a Superintendent in each and an itinerant staff of five graduates under the Divisional Inspector.

Q. You find that enough to push on cotton business in a satisfactory way?—A. You will have to go on extending it.

Q. Increasing your departmental staff?—A. Train men as quickly as possible.

Q. What staff would be necessary to grow 200,000 bales?—A. I should like to have a fully competent graduate in each talukha. If you are going to keep up to a certain grade it is absolutely essential to spend a lot of money and have a big staff.

Q. You do not think this applies to all crops?—A. Only to export crops.

Q. Is it not the case that in certain other parts of India they manage with a smaller staff working on co-operative lines?—A. I have no personal experience of it.

Q. You speak in your note of agricultural classes. What are the results of the school?—A. They have been hardly long enough in existence to give results. They are doing good work. The students are zamindars' sons.

Q. Do you teach them any general agricultural theories?—A. Very little theory but much of practice. There is practical work in the morning and then there is sufficient lecturing work to explain what they have seen in the morning.

Q. You teach them how to use the saw-gin?—A. Yes.

Q. How long has this been going on?—A. It was started in 1911.

Q. Some boys have gone out?—A. Nearly all have gone back to their lands.

Q. Have you kept in touch with them?—A. Some.

Q. And they are doing some good?—A. I think they have done good.

Q. You have had some experience of agricultural implements in Sind. Do you think there is a big future for cheap agricultural implements of the right type such as reaping machines?—A. I do not think that Sind is a place from which you can draw conclusions. We have reaping machines on the farms, but it is hardly a feasible proposition outside.

Q. What about things like ploughs?—A. Ploughs have done very well indeed. There is a good demand now and they are being made in the villages. We have introduced models of Egyptian ploughs. We brought out shares in quantities from England for these ploughs and sold them at one rupee to the local mistries.

Q. You say, "The Imperial Institute of London is of value as the authorities are in touch with the various trades." Supposing we had an Indian Trade Commissioner in England working in close touch with the Board of Trade don't you think that he would be a better man to put you in touch with the trades?—A. As long as he can give me the addresses and tell me about the various firms I want to know, he is quite good enough.

Q. Do the Imperial Institute give addresses?—A. Yes, for example I wanted to send early potatoes from Karachi to Covent Garden Sales and I asked the Imperial Institute to give the address of the people there.

Q. Have you any experience of fruit farming in Sind at all?—A. I have done a little.

Q. Do you think there is a big future for it in Sind?—A. Sind grapes are well known.

Q. Can they be improved?—A. They are very good indeed and they get very good prices.

Q. Do you think anything can be done to improve the packing and despatch of them?—A. I suppose there might be. I have not had any difficulty in sending them down to Poona and Bombay.

Q. Can they be produced on a large scale?—A. Yes. It is a matter of irrigation.

Hon'ble Pandit M. M. Malaviya.—Q. Is there a weaving mill in Sind?—A. They did start one at Hyderabad but it collapsed. This was about four years ago.

Q. Do you know the reason of its collapse?—A. I think it was financially unsound.

Q. It did not receive sufficient financial support?—A. The people who were going to buy went out at the last moment.

Q. Did it collapse in the initial stage before the machinery was bought?—A. They had got machinery erected, but they had not paid for it.

Q. Except this one there has never been any effort to start a weaving mill?—A. I do not know if there was any other.

Q. There is no mill for pressing cotton seed oil?—A. No. It pays better to export cotton seed out of India.

Q. Unless they made an effort to press the oil how could they say that it paid better?—A. They say that the existing trade circumstances are settled and they do not want to disturb them. It is easier to export cotton seeds than it is to export oil.

Q. You say, "It is now well established that before any new export crop can be given out for general cultivation in a district some arrangement must be made for the sale and disposal". Who gives it out?—A. It is recommended and seed given out to cultivators.

Q. Is it merely a recommendation?—A. Yes. No pressure at all.

Q. You say the "Non-export crops need no special Government intervention"?—A. I was taking the example of cotton and wheat. As regards wheat if we are going to grow a high class of hard wheat I think it is necessary to establish Government grades. We can grow much wheat in Sind. It will be a good crop eventually. It is a matter of irrigation. It is grown all over Sind, but it is mostly consumed in Sind.

Q. Is the wheat that you grow not yet exported?—A. It is mostly consumed unless the price reaches such a limit that it pays them to sell the wheat and use other grain.

Q. You say that "in the normal course of work by itinerant instructors, agricultural shows and demonstration plots the various provincial Agricultural departments bring recent improvement to the notice of the cultivators." How is the system of itinerant instructors working? How many have you, for instance, in Sind?—A. We have had five main farms in representative tracts and each farm has about three itinerant instructors. We aimed at 12 to 15 instructors.

Q. I take it that these farms are located at certain places. You have not the American system of demonstration farms being taken from village to village to instruct agriculturists?—A. Yes, for example, there is a farm at Larkhana, and the man goes to the various villages within reach of Larkhana.

Q. Is the whole province of Sind covered by this system of demonstration?—A. One or two districts have not been touched. The Karachi district has not been touched and part of Hyderabad.

Q. When was this system begun?—A. 1907.

Q. Has it led to any perceptible improvement in agriculture?—A. I think it has. It is a matter which will take many years to bear fruit. There is a good beginning made, I think.

Q. But so far as you are aware, have any figures been published up to this time to show what results have followed from this demonstration?—A. It is a very difficult matter to get any reliable figures for the first few years.

Q. I understand that you went to the United States of America at one time?—A. Yes.

Q. You are familiar with the system which obtains there on their demonstration farms?—A. Yes.

Q. In about 1903 they started the Knapps' system in the Southern States of North America?—A. Each State has its own way of doing work. There is no universal system. One State spends a lot of money and another State does not spend any money at all.

Q. They have extended it very largely so as to cover the whole of the Southern States of North America during the course of 9 or 10 years?—A. Some States have done practically nothing.

Q. I read in this book that the yield per acre has doubled from 1903 to 1912?—A. There are a lot of new lands being brought under cultivation which might account for a large part of the increase.

Q. So far as you are aware, the results in Sind have not approached anything like that?—A. No.

Q. You think there is room for expanding the system much more in Sind?—A. Yes.

Mr. C. E. Low.—Q. There is a scheme for increasing very greatly the irrigation in Sind?—A. Yes.

Q. Supposing the maximum amount of irrigation possible is secured, and supposing the values of the different crops continue as they are at present, what proportion of the area do you think will come under cotton cultivation?—A. There will be a very big proportion. It is very difficult to get the figures just now. The whole agricultural system of the country will have to be changed. At present it is worked by inundation canals and there is one crop and the lands lie fallow for about three years before another crop is taken up. With the new canals you will have a more intensive form of cultivation.

Q. You do not think that wheat, for instance, would out cotton?—A. The Sindhi would much rather grow cotton than wheat, and the Punjabi wheat than cotton. Any sign of deterioration in the soil can be put down to bad cultivation, and not to increase of irrigation.

Sir F. H. Stewart.—Q. When was this arrangement made between the Bombay Millowners' Association and the Government?—A. About four years ago.

Q. What were the conditions of it?—A. That Government were to guarantee all the American cotton grown being sent to their gin and they would gin it and give the market price for the cotton.

Q. Have they been getting any cotton?—A. They had been getting quite a lot, but, other buyers stepped in and took it away from them.

Q. Who are not members of the Association?—A. Yes.

Q. Was the arrangement entered into with the Association as such or with certain members of it?—A. With the Association.

Q. When other buyers came along and took it away, did the Government allow it?—A. It could not prevent it. It had no hold on the outside buyers.

Q. Did you make the arrangement?—A. I had nothing to do with the arrangement. It was made by the Director of Agriculture and Government of Bombay. I had nothing to do with it at all.

Q. Were you responsible for seeing that it was carried out when it was made?—A. I was responsible for carrying it out.

Q. It has not been carried out?—A. No.

Q. And it is supposed still to be in existence?—A. The arrangement has been altered. The managing firm failed.

Q. I do not quite understand what the position is now. Is the arrangement still in force?—A. They have got a new arrangement. Now the Director of Agriculture is one of the managers. Before that he had no voice at all. The arrangement was made direct with Government and Messrs. Greaves Cotton, the managing agents on behalf of the Mill Owners' Association.

Q. Has the Government guaranteed that the millowners should get this cotton?—A. There is no guarantee now. It was found unworkable.

Q. So that, in effect, the millowners have erected these gins to no purpose? The whole thing has fallen through?—A. But they are valuable as gins too.

Q. About your remarks with reference to the erection of wheat elevators and the establishment of legal Government grades of wheat, what would be the attitude of the cultivator?—A. He would be pleased if he would get better prices.

Q. As regards the trade?—A. I think the trade would not like any disturbance.

Q. But the trade is interested in improving the quality of Indian wheat, is it not?—A. They are quite pleased with the existing circumstances.

Hon'ble Sir Fauslbhoy Currimbhoy.—Q. Do you think that if the Sukker barrage is built there is any possibility of growing American cotton there?—A. Yes.

Q. Have you tried the Egyptian seed?—A. We started with Egyptian seed.

Q. It failed?—A. It grew well, but it was a matter of irrigation. We could not get sufficient water. It is a six months crop.

Q. There was also difficulty in growing American cotton, because it was not possible to get seed in the Mirpurkhas district where it was started?—A. We got seed direct from America to start with.

Q. You had not much cultivation for the last two years?—A. We got our seed cultivated

Q. How much was the crop?—A. I am not now in Sind.

Q. You say, "The policy of this firm is to avoid speculation in cotton and whatever is bought in Sind is sold simultaneously in Liverpool." They fix the rates?—A. Yes.

Q. If more people come in there will be more competition and the cultivators can get better prices for their cotton, because in every cotton district when there are more than two or three people the cultivators get better prices?—A. They have got a hold over the whole of the export trade in Sind.

Q. They have got the monopoly and so they give what prices they like?—A. I think on the whole it is a fair price.

Q. Do they advance money to the cultivators?—A. No.

Q. You say, "Government intervention in the case of export crops is considered necessary in many countries and has done much to raise the standard and uniformity of export production."—A. Take the case of dairy produce in Australia. The cheese has got to be examined and if it is not of a certain standard it is not allowed to leave the country.

Q. It must have a certain standard?—A. Yes.

President.—Q. Can we get the regulations governing the export of dairy produce from Australia?—A. It is quite easy to get them.

Sir D. J. Tata.—Q. Is the saw-gin used in America for ginning?—A. For all except the Sea Island cotton which is roller ginned. This is very long stapled, and must have a roller gin.

Q. Sind cotton is very short stapled?—A. Desi is very short indeed.

Q. What gins are used for desi?—A. Platt's double knife gins.

Q. For American cotton you recommend the saw-gin?—A. Yes.

Q. It is a longer stapled cotton than desi?—A. Yes.

Q. Has any attempt been made to improve the staple of the desi cotton in any way?—A. Yes. By selection.

Q. With reference to Egyptian cotton, do you say the experiment has failed?—A. It has proved that it will grow very well, provided you have got water.

Q. How long has the experiment in growing Egyptian cotton in Sind been made?—A. It started in 1904 and a small quantity is still grown for demonstration on the Government farm.

Q. It was attempted at first on the sewage farm Karachi?—A. Yes.

Q. The conditions in Sind are more approximate to the conditions in Egypt than anywhere else in India?—A. Yes.

Q. You want silt to be brought down, and the sewage farm served the same purpose?—A. The sewage farm is suitable and there is plenty of labour. The cultivation required for the Egyptian cotton is very much more than for desi cotton.

Q. When the Nile is in flood it brings down silt, and that gives a sort of peculiar manure, and the sewage farm form of cultivation is nearer to that system than ordinary irrigation?—A. In the north of Egypt where they get perennial canals there is very little silt, and even then the crop is a very good one. The results come from a better treatment of the soil.

Q. Have any experiments made tended to increase the output of cotton per acre?—A. We have got very big yields on some of the Government farms. Attempts are being made in that direction.

Dr. E. Hopkinson.—Q. When did you leave Sind?—A. I have been away eighteen months.

Q. Can you give us approximately the figures of output from Sind of American and desi cotton for the last two or three years?—A. Desi cotton is a comparatively recent crop in Sind.

Q. Can you take the years 1912-13, 1914 and describe what cotton was grown in Sind in those years?—A. It did not vary very much in those years. I think it averaged about one lakh of bales of desi cotton. The American cotton was probably about 700 bales in 1914-15 and about 400 bales a year before it. I am not quite sure about these figures.

Q. In 1912-13?—A. It was very much smaller. I do not know what happened last year.

Q. The whole of the American cotton is exported?—A. Some was used in India.

Q. Not in a large proportion?—A. It is very difficult to trace it after it is sold.

Q. You suggest in your evidence that Messrs. Ralli Brothers exported everything they got?—A. Some was exported to Bombay and some to Liverpool.

Q. You say the cotton is sold in Liverpool as soon as it is brought in Sind?—A. Yes.

Q. A considerable portion has gone to Japan?—A. Yes.

Q. What part did you take as Deputy Director of Agriculture in promoting the growth of American cotton?—A. Practically the whole of it.

Q. You started growing in experimental farms?—A. Yes. I arranged to get seed from America and the actual buying of it was done by the British Cotton Growers' Association at Liverpool.

Q. And then you supervised the cultivation?—A. Yes.

Q. And I suppose you saw to the ginning being kept pure?—A. As much as we could.

Q. And then did you go on to give advice as to marketing?—A. No. We stopped at the gin.

Q. The buying agency now is the Bombay Mill Owners' Association?—A. Yes.

Q. The intervention of the Bombay Mill Owners' Association began when you were ready to market cotton?—A. Yes. They only intervened after the British Cotton Growers' Association had offered to intervene.

Q. Why was the offer of the latter declined?—A. Government thought it better to go to the Bombay Mill Owners' Association.

Q. The British Cotton Growing Association had been of assistance in the purchase of seed? They bought seed entirely for you?—A. Yes.

Q. And as a next step you declined their further help? Can you suggest any reason?—A. To promote an Indian Association as against a British Association.

Q. The object of the British Association was to sell at the best possible price?—A. Yes.

Q. Do you think that it was discussed whether competition between two selling agencies might be desirable?—A. I think the idea was that when an Indian Association offered to do the work, it was fair to give the work to them. The British Cotton Growers' Association are still giving us such assistance as is in their power. They send us valuation reports of various cotton. Any seed that is not required for sowing next year is bought locally and is used for cattle feeding.

Q. There is no necessity to import seed now?—A. There might be in the future if local seed got mixed with desi.

Q. With respect to the Bombay Association, are they still continuing to gin the crop?—A. Yes. Under the new agreement it is still going on.

Q. Is all cotton a three-year crop in Sind?—A. No. It is grown one year and the land lies fallow for a couple of years. That is the usual custom. It is not necessary to leave the land fallow. If there is water, they may take a crop between.

Q. With an increase in irrigation that would be altered?—A. Yes.

Q. And it will be an annual crop?—A. It is bound to be. It is only picked for one season and then it is generally eaten by the cattle.

Q. Is it ever ploughed in?—A. It is very difficult to plough it in, because it is very woody.

Q. You say that when you were in Sind you knew nothing about what was going on in the Punjab and when you went to visit the Punjab, what did they know of your work in Sind?—A. They knew nothing of what was going on in Sind.

Q. The two provinces are as far away as the poles?—A. Yes.

Q. How did you publish your results in Sind?—A. They are published through the Director of Agriculture, Bombay, in the form of bulletins and annual report.

Q. The same system applies in the Punjab?—A. Yes.

Q. In the Punjab do they publish any bulletin?—A. There are no bulletins, but there are annual administration reports.

Q. You have not seen them?—A. In any case they did not start American cotton as soon as we did in Sind.

Q. You have now got to know what is going on in the rest of India?—A. You are not confined to one province but you have to find out what is going on in the various provinces.

Q. Is it the practice of your department to study the publications of the Local Governments?—A. A tremendous mass of publications comes in, and you have to select what you are particularly interested in.

Q. Does Pusa take any part in bringing Sind and the Punjab more in touch with each other?—A. I think it does, because I have just come down from the Punjab and I know exactly what they are doing. In the next month I may go to Sind and then I will tell them what I have seen in the Punjab.

President.—Q. Who looks after your farming arrangements at Pusa during your tour?—A. I try to arrange that the cold weather crop is sown, and then I tour. There is a cotton specialist, Mr. Gammie.

Q. Is he doing any of your work. Are your duties overlapping?—A. He has devoted much attention to the south,—Bombay, Madras and the United Provinces.

Q. Are you in constant touch with him?—A. I have not been enough at Pusa. Pusa is not a cotton country. His headquarters are at Poona.

Q. He did not interfere with your work in Sind?—A. He came to Sind once or twice, and then went to the Punjab.

Q. Did he not bring you in touch with what was going on in the Punjab?—A. When he came I was on leave and some one was acting for me.

Q. You had in Sind other duties to attend to besides cotton?—A. Yes.

Q. Would cotton questions alone be sufficient for you to take up in Sind and the Punjab in addition to Mr. Gammie?—A. It is too soon to have a special man.

Dr. E. Hopkinson.—Q. How often does the Council at Pusa meet?—A. The Council at Pusa meets once a month. I have attended two meetings since I have been there. I have been there only six months.

Q. You refer to the Imperial Institute being able to give valuable valuations and reports?—A. Yes.

Q. You speak of your own experience?—A. Yes.

Q. In respect of cotton?—A. Cotton and other things. In a case like wheat, specially soft wheat for Macao, I sent some samples to them and they sent them to Naples and got me into touch with people there and gave me trade valuations in Italy.

Q. What have they done for you in connection with cotton?—A. They have given frequent valuations of Egyptian, American and desi cotton.

Q. Where do they get valuations from?—A. They send it on to some of the brokers in Liverpool.

Q. You have the sons of zamindars as your students. Do you get them to work themselves with their own hands on the farms?—A. If we find a boy is not inclined to work we ask him to go away.

Mr. A. Chatterton.—Q. The American cotton depends upon the improvement of facilities for irrigation?—A. Yes.

Q. The Sukker barrage will take many years to construct?—A. About 10 or 12 years.

Q. And in the meantime you are entirely dependent on these inundation canals?—A. There is one big perennial canal on the Punjab system.

Q. When is the cotton sown?—A. The Sindhi sows it in the beginning of June. We are advising him to sow it at the beginning of April when water is available. The Sindhis pay combined assessment which includes revenue and water rate for each crop. It varies in different villages. It is about Rs. 3-8-0 an acre for cotton.

Q. What yield per acre of American cotton do you get?—A. Five or six maunds per acre.

Q. Does that yield much profit to the ryot in a normal year?—A. Rs. 13 a maund is a very good price.

Q. And he could afford to pay a higher water rate than he now pays?—A. All the cultivation is done by the annual tenant and the zamindar takes half the produce as a rule and the cultivator the other half.

Q. So long as these inundation canals are in existence can water be supplied by pumping?—A. The value of land is so low that I do not think that any form of pumping will ensure profit.

Q. Has that matter been gone into?—A. Engingeers have gone into that.

Q. In an ordinary season is there much water left in the river which may be brought to the inundation canals by pumping?—A. The population is fairly limited and I think the water is quite sufficient for the population existing at present.

Q. If you put in a perennial system of irrigation you will have to introduce people into the country?—A. Yes, from the Punjab.

Q. Can you tell what the duty of water is under the cotton crop?—A. About 70 to 80 acres. It is very low.

Q. Are the crops standing in water, or are they irrigated?—A. It is periodic. In June it is very hot and it is watered once in ten days.

Q. Why should it be so low?—A. The soil is absorbent and there is terrific heat.

Q. What percentage of lint do you get from American cotton?—A. About 32.

Q. Have any attempts so far been made to introduce irrigation by pumping from the canals?—A. We have got a farm which is irrigated exclusively by a pump and a portable engine on the river.

Q. Have you any data as to the cost of irrigation in this way?—A. Yes.

Q. How much did it cost?—A. It came to Rs. 20 an acre.

Q. Is that too high a rate for extensive cultivation?—A. You can get flood water from the canals for Rs. 3-8-0.

Q. Instead of the preparation of a very much larger scheme of perennial irrigation, can you not instal pumps much cheaper so as to gradually extend the area under cultivation?—A. Most of the areas is under cultivation at one time or another, but you have got the fallow system. With the perennial canals these fallows will be cut out.

Q. Can you begin to cut them out by introducing an artificial means of lifting water?—A. With inundation canals half are fallow already.

Q. How long do they flow?—A. For four or five months.

Q. From the agricultural point of view would a perennial system of irrigation be of greater value than inundation system?—A. If you had the population, perennial would be much more valuable.

Q. What system of cultivation would you introduce if you had perennial irrigation?—A. A constant succession of crops all the year round.

Q. For instance, in Egypt they get an yield of Rs. 300 or 400 an acre for cotton?—A. Yes.

Q. If it costs Rs. 20 to pump water will it not pay to introduce pumping methods?—A. When they get the perennial canal completed they would give concessions of land and the land would be pretty cheap.

Q. It will take 10 or 15 years?—A. Yes.

Q. The whole scheme is hung up at the present time?—A. Yes, for financial reasons on account of war.

Q. Would it not then be advisable to direct attention to the possibilities of pumping with a view to ascertaining whether it is not possible to get a much higher water rate for the water?—A. There has been a good number of these pumps.

Q. Is this irrigation work under the Agricultural Engineer of the Government department?—A. It was started before I was appointed.

Q. Was he exercising any control over them?—A. No, but he advises when he is asked to do so as regards new installations.

Q. Is there any organised system by Government to try and develop work in this direction?—A. No. If any one asks us for advice we examine the scheme for him and send it to the engineer.

Q. In this case is the lift very high?—A. Round Karachi it is quite small about 20 feet maximum.

Sir D. J. Tata.—Q. Is any attempt made to popularise manures?—A. We have done more in the way of green manure and leguminous crops. We have used artificials to a large extent but we do not recommend them to the outside in the mean time.

Q. Are not oilseeds used as manure and is there any attempt made to retain them in this country?—A. Oilseeds are more used for feeding than manuring.

Q. I meant cake. You said that oil seeds were exported more, if the oil could be pressed and the seed cake used for manuring would it not be more serviceable?—A. It is a case of supply and demand. It does not pay.

Q. Have you been able to demonstrate it one way or the other?—A. We have been using ordinary oilseed for feeding regularly.

Q. With regard to the selling of cotton being entrusted to an Indian agency, is it not possible that the idea might have been that all the cotton could be used in this country if the work was entrusted to an Indian agency? If it was given to an English agency they would export it?—A. They would not necessarily export. They would sell it in India if they got a better price. They offered to do that.

Q. Have you any knowledge of the experiments made by the late Mr. J. N. Tata? He tried to get cotton grown on the Egyptian system from seed supplied by him?—A. I started the growing of Egyptian cotton on the farms on the Egyptian system, but I altered it considerably later because we could not get labour. The Egyptian cotton is purely an irrigated crop. Mr. Tata sent Egyptian seed to non-irrigated areas, and therefore his experiment to introduce Egyptian cotton failed.

President.—Q. Can you give us an idea of what fertilisers are acceptable in Sind that would be absorbed in any quantity?—A. None for a long time yet—except to a limited extent round centres like Hyderabad and Karachi.

Q. Is that due to economic reasons or due to the special condition of the soil?—A. Partly due to the condition of the soil. Nitrogen is the limiting constituent and you can get nitrogen more cheaply by the growth of leguminous crops.

Q. You do not recommend, from your knowledge of the place, the use of any fertilisers?—A. Not in general cultivation.

Q. In intensive cultivation what fertiliser has been found to be suitable?—A. Nitrate of soda. Potash manures are not required for that class of soil.

Q. Do you know whether potash has been found to be of any value as fertiliser in any parts of India?—A. In parts of Assam.

Q. But not in general agriculture anywhere?—A. No.

Q. Is that due partly to the fact that the soil is already charged with potash?—A. Yes.

Q. For instance, in Bihar where potash is a product of the soil in the form of potassium nitrate?—A. Yes. My work in cotton has been published in a bulletin and I shall send you a copy of it.

WITNESS No. 122.

Mr. H. E. Annett.

MR. H. E. ANNETT, *Agricultural Chemist to the Government of Bengal.*

WRITTEN EVIDENCE.

Demonstration
factories.

In my note on the remarks for the "Preliminary note on the scope of enquiry by the Indian Industrial Commission," which I submitted to the Commission through the Government of Bengal, I mentioned that there is quite a big palm sugar refining industry carried out in parts of Bengal. It is my opinion that there is quite a scope for the introduction of small plants for refining the raw palm gur by centrifugals. I have planned experiments on this point for the present cold weather.

If these turn out as I expect, then I would suggest that a demonstration factory be started for the next season.

Research abroad.

There are now a number of quite well equipped scientific institutions in India. I cannot therefore see the necessity for special arrangements for research in England. It is far preferable to appoint men to work in India at these institutions. I may instance the recent

appointments of Mr. Davis at Pusa to work on indigo problems and of myself to work on opium problems in the United Provinces. Neither of these investigations could be carried out in England in a satisfactory manner.

It has often occurred to me that efforts might be made to attract research students to India to work on special problems. There are numerous students who having passed through their university career have obtained scholarships or exhibitions of say £150 per year for 3 years. I might mention the Frank Smart studentships, 1851 Exhibitions and the recent scholarships instituted by the Agricultural Development Commissioners. The holders of these latter particularly have hitherto worked for two years at an English University and then for one year on the Continent. They could acquire useful experience and have a wide choice of subjects in India. The amount of their scholarships would however have to be supplemented in some way or other. Thus I would suggest that Government pay their travelling expenses to India and return *plus* perhaps a small allowance.

Q. 24.—I suggest some such scheme as the following :—A science board should be formed for each province, which could be nominated by Government and should consist of a number of well qualified science men. That body would keep a list of all the provincial science workers. When a problem came forward for investigation it could be circulated to the members of the board or they could meet together and it could then be referred for investigation to the man considered most suitable to tackle it.

I do not think the Indian Science Congress could be a sufficiently representative body to do this work. I feel that a provincial board, having a more limited field of choice could be much more capable of allotting an investigation to a suitable man.

Q. 41.—(1) I might note here that I have little faith in the figures published annually purporting to show the crop production in Bengal. In the absence of a large and efficient revenue staff, such for instance as is found in the United Provinces, there seems to be no possibility of arriving at even an approximate figure for crop production in Bengal. The absence of such a staff is directly due to the permanent settlement. The figures at present published may be more or less relative from year to year but this is all that can be said for them.

(2) There are a few places in Bengal where perhaps cane factories might be successful but for the impossibility of the factory to obtain control of its own land and hence though Bengal is said to produce 10 per cent. of India's sugar, I see little prospect there for cane factories.

(3) I have, however, advocated the probabilities of the success of date palm sugar factories. This is because I think the difficulties of handling palm juice tend to rule out of court large estates. Thus I think 100 to 500 acres would be the best sizes for palm sugar estates. Moreover, it would be easier to obtain these smaller estates than the 2,000 to 3,000 acres required for a cane sugar factory.

Acquisition of land I may mention frequently arouses bad feeling in a district and this would tend to cause difficulties to a factory management. If, however, Government wants to increase her sugar output she must aid in the establishment of these factories. Possibly eventually, as in some of the German beet sugar factories, the cultivators might be induced to take shares in such factories. Government might even go so far as to purchase shares in a factory for allotment to cultivators whose lands have been acquired.

In my note on the palm sugar and alcohol industries attached to this note, I have recommended that a special fermentation chemist be appointed to take up work in connection with the palm sugar and alcohol industries. I should imagine that each province could do with a fermentation chemist. I know that the Excise Department in Bengal are frequently in need of someone to whom they can take various investigations. Imperial technical and scientific departments.

Q. 74.—I do not consider that any measures need be taken to co-ordinate and prevent unnecessary overlapping of the research activities in Government technical and scientific departments, special technological institutes and university colleges. I do not think there is likely to be any real overlapping. By any such action as is hinted at scientific work would, in my opinion, be hindered. Co-ordination of research.

Q. 77.—Every encouragement should be given to the Government technical and scientific experts to study conditions and methods in other countries. Knowledge obtained at first hand is of far greater value than that obtained from literature. The trouble is that if one advertises the fact that one is studying a particular subject for the benefit of one's own country that certain countries will not welcome such visitors. I may instance Java with the sugar cane industry and Turkey, even in pre-war days, as regards tobacco and opium poppy culture where such visitors would not be warmly welcomed. Study of foreign methods.

It occurs to me that there are certain Government scientific libraries in India which are unknown to the ordinary worker. It might be of advantage if Government made a register of all libraries. It would also be of advantage if a list were made of all sets of scientific periodicals arranged according to country of publication and subject and stating which Indian libraries contained each. At present one frequently wishes to consult a journal not in one's own library and has no idea where to find it in India. Reference libraries.

Qs. 110 and 111.—In my note forwarded to the Commission through the Government of Bengal, I have already set out views on the development of the palm sugar industry and alcohol manufacture. General.

Q. 118.—As set out in my note referred to above, the fruit of the sundry tree, which grows in the Sunderbans, is very rich in starch, is very abundant and should be a cheap source of alcohol.

Remarks on the "Preliminary note on the scope of enquiry by the Indian Industrial Commission."

The remarks I am submitting herewith refer mostly to the sugar and alcohol industries and apply to the following paragraphs of the note :—

11 (d) Sugar and alcohol manufactures.

17 (h) Pioneering industries and handing them over to private companies.

As regards—

19 (k) My opinion is that there is at present no need to adopt measures to prevent unnecessary overlapping of research activities by technical departments, special technological institutes and university colleges.

Palms as a source of sugar.

1. *Sugar production.*

A.—Introduction.

Numerous species of palm trees are used in different parts of the world for the production of sugar and alcoholic beverages.

India, however, is the country in which the production of palm sugar is of chief importance. According to a competent authority, the *late Mr. Noël Paton, Director General of Commercial Intelligence, palm sugar represents 17 per cent. of the total sugar production in India. My own investigations enable me to state that the proportion is certainly not below 10 per cent, which equals roughly 250,000 tons. Somewhere approaching 100,000 tons of this is produced in Bengal alone.

Most of this sugar appears on the market as gur or jaggery. In Madras, I find that nearly 30,000 tons are annually bought by European firms for refining purposes.

In Bengal, Cossipore Sugar Works purchase a considerable amount of high grade native palm sugar for refining purposes.

I might add that Mr. Noël Paton put the annual output of refined commercial palm sugar in India at 64,230 tons valued at nearly 1,000,000 sterling.

It seems strange that an industry of this magnitude should have received so little attention. I first turned my attention to it in 1911 and in 1913, I published a memoir entitled "The Date Sugar Industry in Bengal" which appeared as a departmental memoir of the Department of Agriculture in India. This paper gives an account of the history and development of the industry and of its commercial aspect among other more scientific matters. I have recently been able to devote more attention to the matter and my experiences convince me that the matter is one for consideration by the Indian Industrial Commission.

I feel that there is room for a special establishment to deal with the question. At present it simply forms a branch of my work.

The important sugar producing palm in Bengal is the wild date. This is grown in plantations. 350 trees per acre can be planted and these at a conservative estimate should yield 3½ tons of gur per acre. The average yield of cane gur in India is stated to be under 1 ton per acre. The advantages in favour of date palms are :—

1. The low annual cost of cultivation.
2. The trees will bear continuously for 40 to 50 years.
3. One is certain of a normal crop year by year and is independent of drought or flood.
4. Different palms yield their sugar at different seasons of the year. Hence a very long season is possible.
5. No crushing mills are needed to expel the juice.

To my mind these advantages will more than outweigh the disadvantages which are :—

1. That the trees are not ready for tapping until 5-6 years after planting the seeds.
2. That fuel will for the most part have to be purchased since there is no megass as in the case of cane.

B.—Palms are a cheap source of sugar.

The fact that a matter of some 50,000 tons of raw palm sugar and jaggery is annually used for refining in European sugar refineries in India would seem to indicate that palms are a paying source of sugar. It is certainly a fact that on the basis of sugar content palm gur

*Notes on sugar in India, 1911, by Mr. Noël Paton.

and jaggery are much cheaper as a source of refined sugar than is cane-gur. The following analyses and prices will illustrate this point:—

	Palmyra jaggery from Madras. Per cent.	Date palm gur of Jessore. Per cent.	Cane gur bought for refining at Tarpur Sugar Works. Per cent.
Sugars	73 to 75	67 to 78	75
Reducing sugars	1 to 4	3 to 8	7
Price per md. of 80 lbs.	Rs. 2-18-0(a)	Rs. 2-12-0(a)	Rs. 6-0-0(b)

It is further to be noted that there has been no upward tendency of prices during the period of about 16 years immediately preceding the present war.

The following figures are of interest in this connection. A European factory which refines large quantities of palm jaggery also refines cane jaggery and Mauritius, and other sugar as it can get them. Early in 1915 this firm paid the following prices for these various materials. The refining value of each kind of sugar is also stated:—

	Refining value.	Price per maund of 80 lbs.		
		Rs.	A.	P.
Palm jaggery	54 to 56	3	3	0
Cane jaggery	48	5	15	0
Mauritius sugar	60	5	15	0

Palm jaggery is here seen to be easily the cheapest material of the three.

It is only fair to remark that the price paid for Mauritius sugar was considerably above pre-war rates. Palm jaggery has, however, increased but little in price as a result of the war. The fairly uniform price of palm jaggery from year to year is another point in their favour.

C.—Early English palm sugar factories.

Sugar factories have been established in Bengal at various periods from 1830 to the early eighties. Some of these worked at a profit for some time but they had many difficulties to contend with. One of the first great blows was in 1846 when Parliament decided in the case of sugar only to encourage slave labour and again shortly after this duties on all sugars from all parts of the world were equalised.

Another reason why these factories did not continue to be successful was that the demand for native refined sugar was greater than that for the first rate sugar manufactured by European means and the Europeans lost the trade.

Sugar manufacturing machinery has undergone vast improvement of recent years and a factory which would now be erected would work much more economically than those of the earlier days.

D.—Modern sugar factories.

1. *Tarpur Sugar Works.*—This is a swadeshi company which has within the last few years taken over old works which were originally built in 1853. The works were renovated some 20 years ago. I have seen really good sugar produced there direct from the date juice. The factory, however, had to buy juice from cultivators and under these circumstances they could not get enough to work their vacuum pan economically. To my mind it was a pity that the money put into this venture was not invested in a more compact and recent factory. It is important that a factory has control over trees of its own.

The factory has recently been working as a refinery dealing with date gur and with cane gur imported from the United Provinces.

2. *Nellikuppam Sugar Factory.*—This is situated in South Arcot, Madras Presidency. The factory is run on exceedingly sound lines and works up some 2,000 acres of cane per season. In addition to this it refines very large quantities of palmyra jaggery which it imports from all parts of Madras by means of agencies established at various centres. Messrs. Perry and Co. are agents for this factory and they have a large factory in Tinnevely where they make jaggery themselves direct from palmyra trees.

3. *Samalkot Sugar Factory.*—This is situated in Godavery District, Madras Presidency. It refines imported and indigenous sugars but depends chiefly on palmyra palm jaggery. Both Nellikuppam and Samalkot have distilleries attached to them.

(a) Price received by cultivators.

(b) This includes cost of carriage from United Provinces.

* Price asked by cultivators and not actually purchased by factory as rate is considered too high.

B.—Proposals.

There are two lines of work in Bengal which I propose :—

1. *The improvement of the native industry :—*

- (a) My own work has shewn that if the Bengal cultivators take up the practice of liming the pots in which they collect the juice that the yield of gur might be increased something like 20 per cent. Liming is universal in Madras.
- (b) By introducing a more economical furnace :—My own work has shewn that there is considerable wastage of fuel.
- (c) There seems reason to believe that centrifugals might be introduced for refining the gur. At present very wasteful native refining processes are in use. This native refining industry is a very large one.

2. *The establishment of an up-to-date white sugar factory for the production of sugar direct from the juice.*—I may mention here that it is unlikely that large central cane sugar factories will ever be possible in Bengal since it would be impossible for such a factory to get control over a sufficient area of land several thousands of acres for one factory.

I believe, however, it is possible in the case of the date palm industry to establish very paying factories to deal with the produce of one to five hundred acres. It is a factory such as this which I would like to see established. It seems to me, however, that Government would have to start a pioneer factory. The experiment would cost Government at least a lakh of rupees but a good part of this would be recovered by sale of the factory if it were a success.

If it be considered that the industry is worthy of investigation, then a special scientific officer with competent staff would have to be entertained since there are numerous lines of work which promise to be of benefit to the industry.

I might suggest that this same staff could probably help the Excise Department with investigations dealing with fermentation. Investigation of the nipa palm and of the fruit of the soondry trees as sources of alcohol are cases which immediately occur to me.

Sources of alcohol.—1. Nipa palm (*nipa fruticans*) :—Gibbs in the Phillippine Islands has of recent years performed much valuable work on the subject of the use of certain palms for alcohol production. In the Phillippines the nipa palm (*nipa fruticans*) is a very important source of alcohol.

The following table shows how the production of alcohol from nipa palms has been increasing in these islands :—

	Gallons of proof spirit.
1905	594,000
1906	1,210,000
1907	1,650,000
1908	1,740,000
1909	1,870,000
1910	2,184,000

The following table compiled by Gibbs * shows the comparative figures as to the cost of production of alcohol from various sources. The cost is given in U. S. dollars and the cost given in the table refers to the cost of the raw material required to produce one litre of 100 or of 180 proof spirit, respectively.

Source.	Cost of raw materials required to produce one litre :—	
	100 proof.	180 proof (90 per cent. alcohol).
Sugar beets at \$ 4.75—5.00 per ton	\$ 0.032	\$ 0.058
Sorghum stalks at \$ 3 per ton	0.032	0.059
Sugar cane at \$ 3 to 3.25	0.028	0.060
Beet molasses at \$ 15 per ton	0.028—0.029	0.050—0.053
Cane molasses at \$ 0.12 per gal.	0.032	0.059
Jerusalem artichokes \$ 5 per ton	0.027	0.048
Cassava at \$ 5 per ton	0.019	0.034
Potatoes at \$ 4 per ton per culls	0.021	0.037
Sweet potatoes at \$ 8 per ton	0.031	0.056
Barley at \$ 0.65 per bush. of 48 lbs.	0.041	0.074
Maise at \$ 0.70 " " " 56 "	0.037	0.066
Oats at \$ 0.35 " " " 32 "	0.046	0.083
Rye at \$ 0.80 " " " 56 "	0.051	0.092
Nipa at \$ 0.0089 per litre equivalent to 6.5 per cent. alcohol	0.015	0.027
Coconut at \$ 0.006 per litre equivalent to 6.5 per cent. alcohol	0.0384	0.069
Coconut at \$ 0.0062 per litre equivalent to 6.07 per cent. alcohol	0.0438	0.088
(Actual case of one distillery).		

Gibbs concludes that nipa sap is the cheapest source of alcohol in the world.

The nipa is a swamp palm which grows gregariously about the mouths of tidal rivers. In the Philippines large swamp areas are covered by natural growths of this palm.

It also grows very commonly in the Sundarbans. I have myself seen plantations at Cox's Bazar and have examined the juices chemically. At Cox's Bazar country liquor is made from the juice. In the Philippines the tendency has, of recent years, been in the direction of replacing the old pot stills by large up-to-date distilleries.

Gibbs quotes the case of one distillery which is producing 93 per cent. alcohol (186 proof) at a cost of 0.10 peso per litre with their plant running 12 hours per day. This is equivalent to 11.4 annas per gallon. On a 24 hours basis with the introduction of some additional economies Gibbs says that this grade of alcohol could be produced at 0.07 to 0.075 pesos per litre i.e., 8 annas per gallon. These figures include the over head expense of the distillery and nipa groves.

Suggestions.—It certainly seems that we have in the nipa palm an exceedingly cheap source of alcohol. The nipa palm flourishes on land which is practically useless for anything else. I suggest that a survey of the existing nipa palm areas and of areas suitable for their growth be taken up in Bengal.

2. Soondry tree fruit.

I understand that the fruit of the soondry tree which grows in profusion in the Sundarbans is very rich in starch and that the Excise Department are of opinion that a nipa distillery might also utilise this substance. I therefore also think that information should be collected as to the amount of soondry fruit available. By means of the amylo process a very cheap alcohol should be produced from this substance.

3. Date sugar molasses.

A considerable amount of this substance is annually bought by large distilling firms. At present the annual variations in price are very large as the following table will show :—

Season.										Price per maund of 80 lbs.		
										Rs.	A.	P.
1898-1899	1	15	0
1899-1900	2	1	0
1900-1901	2	4	0
1901-1902	1	18	0
1902-1903	1	8	0
1903-1904	1	11	0
1904-1905	2	1	0
1905-1906	2	13	0
1906-1907	1	11	0
1907-1908	1	15	0
1908-1909	1	12	0
1909-1910	2	0	0

It will be of interest to work out the cost of the date molasses required to produce one litre of proof alcohol in order to compare it with the cost of other raw materials as set out in Gibbs' table above.

One maund of date molasses will easily yield 4 gallons of 100 proof spirit. This equals 18.2 litres. If we take Rs. 2 per maund as the price of the molasses then we find that one litre of proof spirit costs us 1.75 annas or in the terms of Gibbs table \$0.035. It has been stated, however, by a man in the trade that to a sugar factory with its own distillery the cost of the molasses would not be more than Re. one per maund and with this view I agree. Under these circumstances, the raw material required to produce one litre of proof spirit would not cost more than 0.018 and would almost rival nipa palm sap in Gibbs' table as the cheapest source of alcohol.

Suggestions.—To my recommendation for the establishment of a sugar factory I would add that a distillery should be run in connection with that factory. I know of one European firm of standing who would probably take the matter up, provided Government gave them certain reasonable facilities.

Under the present conditions of spirit manufacture from Bengal date molasses the sugar manufacturer after having used primitive and wasteful methods for the production of this sugar has to make a big profit on his molasses. The distiller in turn has to make a profit. If the distillery were attached to the sugar factory it is obvious that the alcohol could be produced at a much lower rate.

ORAL EVIDENCE, 8TH DECEMBER, 1916.

President.—Q. I want to know from you if this system of scholarships that you refer to would be responded to if we developed it by bringing out from home men of the demonstrator

and assistant lecturer class, possibly even post graduate research students?—A. I have often thought of the scheme myself. When I was at home on study leave I met quite a number of young people who were doing post graduate work. It struck me that it would be an extremely good thing if they could be given an opportunity of doing their post graduate work in India. They would have to be carefully selected.

Q. Is it not a fact that in trying to recruit young men they will not commit themselves to a full service, but will come out for a short period?—A. That will be one of the conditions, but Government might approve their work and make it worth their while to stay.

Q. The working of that system is not convenient under the ordinary service regulations. If a man comes out for a short period he has one eye on his work and one eye on something else. We might get over that difficulty by instituting a system of scholarships that would induce the man to take an interest in the work and that would give suitable recruits for the scientific and technical departments?—A. That is my idea.

Q. Do you think there are enough problems to engage their attention?—A. There are plenty of problems.

Q. You suggest that each province might be provided with fermentation chemists. That of course would not apply to the smaller provinces. Do you think there would be enough occupation for eight or nine fermentation chemists in the country?—A. I could hardly go so far ahead as that. After the scheme is started you would then be able to say. There are two or three provinces however which want men straight away. Bengal ought to have one and United Provinces another. Madras can have one. I think work can be found for five.

Q. With reference to your suggestion that Government scientific libraries might be better known, it has been suggested to us that there ought to be a sort of library census in India with descriptive card catalogue of the contents of each library. Would that appeal to you as a suitable way of bringing these libraries into greater use?—A. As long as they are sufficiently advertised.

Q. If there were a central authority to whom we could write for information as to what literature to get on any subject would not that be a good thing?—A. That would mean the establishment of a special library organisation.

Q. Don't you think that you want an organisation if it is going to be of any use?—A. That would mean a very large organisation. There are doubtless several excellent scientific libraries in India very little known to the majority of workers. Thus we have an excellent one at the Agricultural College, Cawnpore. More libraries of this type would be useful.

Q. If library catalogues are issued in pamphlet form they become buried like the agricultural bulletins. They are not read by anybody?—A. What I think is there ought to be some one to whom we should be able to write for information.

Q. Do you think a central organisation would be more efficient?—A. I do.

Mr. A. Chatterton.—Q. About the development of date palms as a source of sugar, is there any difficulty in Bengal in regard to the operations of the Excise Department?—A. None in Bengal.

Q. Do date palms require any particular soil for a vigorous growth?—A. I have seen growing on all kinds of soil.

Q. Has the yield of juice any relation to the soil?—A. I have no evidence at all on that point but the people in the palm districts think it has.

Q. Is growth in any way effected by rainfall?—A. In the places where there is much less rain certainly the palms are not so flourishing. Bengal palms are more flourishing than those of Central India.

Q. How do the Bengal cultivators boil the juice?—A. In ordinary earthenware pots in the ground.

Q. What kind of jaggery do they make?—A. It is rather a solid rab. It is not quite so liquid as a rab and it is not a solid gur. It is rather thick.

Q. Is any gur worked up in refineries?—A. In Bengal gur is only bought by the Tarpur Sugar Works for refining and a very large quantity of it is refined by native methods. I should think 20 to 25 per cent. of the total gur is refined by native methods.

Q. What process do they use?—A. The gur is beaten up just to mix it up with sugar crystals and it is placed in a big basket holding two or three maunds and it is allowed to drain for a week. The molasses drains away below. They put water weed to a depth of two inches and allow the process to proceed for another length of time and the top two or three inches in the basket become whitened. We work it in this way until the whole process is finished.

Q. Have you tried to introduce refined methods?—A. I refined a few maunds last year. We had absolutely no difficulty in getting crystals.

In regard to your remarks about the manufacture of cane jaggery in Bengal have any experiments been made to improve on the indigenous methods. There is nothing at all being done in the way of improvement.

Q. Is the cultivation of sugar cane at all concentrated in any parts of Bengal?—A. No. It is mostly in scattered areas. There are only one or two places in which cultivation is concentrated.

Q. The cane is crushed in bullock mills?—A. Yes.

Q. Have power mills been tried?—A. We were talking of putting one up like those at work in Mysore. They have just obtained a small power mill in Rangpur. They are going to try it on the Government farm and if they find that it is working satisfactorily there is an idea of trying it in the north of Mymensingh district.

Q. Is there any market in Bengal for the molasses apart from the distilleries?—A. There is fair market for mixing it with tobacco. I am afraid a lot of the molasses is specially imported from Java for that purpose.

Q. At present the supply of molasses is not equal to the demand?—A. It pays the people to import Java molasses.

Q. You make suggestions about the manufacture of alcohol from the soondry tree. Has anything been done in that direction?—A. No.

Q. To test such suggestions what organisation should be arranged. Do you think there ought to be a Department of Industries in Bengal?—A. It is rather a difficult question to decide on. I consider there ought to be some board or other for considering these problems and there ought to be a man who is put on special work entirely for this.

Q. There is nobody in Bengal to deal with these questions?—A. I started the work on my own responsibility and I am now getting to a stage when the work is too much for me.

President.—Q. Is there not a great deal of routine work to be done in the laboratories in addition to these investigations?—A. There are quite a number of things to attend to. I have recommended certain improvements but in order to push them it means that I have to leave my legitimate work and go from village to village in order to demonstrate them.

Q. If you had a Department of Industries in Bengal you would be able to put forward a variety of suggestions and proposals for the development of the local products?—A. In one or two instances I could do that straight away.

Q. Would you consider it better to hand over these problems to a department of that character, which should be more or less commercial in its objects, or is it necessary to go through the intermediate stage in which these questions should be dealt with by specialists deputed from a central technological institute or from a central department of chemists to carry out the work to a further stage before any actual commercial developments are attempted?—A. I think the stage has come now when the work could go before the commercial people.

Q. Have you placed these proposals before commercial people at all?—A. Yes.

Q. Is there any prospect of anybody taking the matter up?—A. There is the prospect of one firm taking it up.

Q. Do they want Government assistance?—A. They want some guarantee for spirit contract.

Q. In a case like this before you could be justified in asking a commercial firm to take it up, Government or some body should organise the work on a commercial scale and thus bridge over the gap between the laboratory and actual commerce. That would require continuous attention on the part of the technical specialists?—A. That is why I wanted Government to come in. If Government could set aside, say, about 400 acres of land and if the test could be run (there is some risk but not very much) by Government as a test factory and were successful, I do not think there will be any difficulty in getting people to take the matter up. Of course one has to risk failure.

Dr. E. Hopkinson.—Q. Have you been lent by the Government of Bengal to the Government of the United Provinces for researches on opium?—A. Yes.

Q. How did that investigation originate?—A. There has been a shortage at home of medical opium as the opium laid down by the British Pharmacopœia must contain 9·5 to 10·5 per cent of morphine. The Indian opium is said to contain 5 to 6 per cent of morphine which is lower than the home requirement. That is the reason why this opium is of no use for medicinal purposes and now Government thinks it is a convenient opportunity to step in and take the Turkish trade. Most of the medical opium is obtained from Turkey. That was the reason that gave rise to the investigation.

Q. I want to get at this point, whether the Government of the United Provinces took this up as a commercial proposition or at the request of the British Government?—A. It was through the Financial Department of the Government of India that I was appointed. I think it was thought that there was no reason why India should not produce some of the opium the trade of which till now was in the hands of Turkey. My services have been placed at the disposal of the United Provinces Government for six months. There is no possibility of the work finishing before three years.

Q. What about your work in Bengal?—A. There is no one to attend to it. Mr. Finlow is acting for me and he is doing three men's work.

Sir F. H. Stewart.—Q. How long have you been out in India?—A. Ten years next May.

Q. If the Government were to start these demonstration factories that you suggest what amount of capital would be required?—A. I wrote home to a Scottish engineering firm. I got estimates for a factory to produce a ton of sugar a day. The cost will be 60 to 70 thousand rupees.

Q. Would you be able to get the labour in Bengal?—A. I think there would be a good deal of labour available.

Q. There would be no difficulty about that?—A. I do not think so.

Q. You say that you have very little faith in the figures regarding crop production of Bengal?—A. I do not know whether I ought to have made that remark. It is my own opinion. I have arrived at that entirely from the point of view of sugar in which I have been interested. Having seen the systems in the United Provinces and in Bengal there is no comparison between them.

Q. You cannot make any suggestions?—A. Not with things as they are.

Mr. C. E. Low.—Q. Do you know the cost at which Java alcohol could be landed in Calcutta at pre-war rates?—A. I do not remember the pre-war rates. I think it worked out to 12 annas a gallon.

Q. What degree of strength? 95 per cent. by volume that is 182 proof or something of the sort?—A. They could import it at much less. The majority of the molasses in Java is simply thrown away.

Q. Do you think that any proposition of the kind that you mention for making sugar out of these palm trees could be successful without an excise distillery behind it?—A. I think there is a possibility of success but I think that any firm who went into it would want a spirit contract.

Q. Supposing he had not got a contract for the supply of portable liquor, he will have to produce industrial alcohol. If he wanted to utilise his palm juice he would have to make industrial alcohol?—A. If he could not get a market for molasses as such.

Q. Do you think he could?—A. There is a big demand for molasses in Bengal.

Q. Java would be a serious competitor?—A. We could easily undersell them.

Q. You say there is little prospect of cane factories in Bengal owing to the difficulty of getting land. Do you know that in Bihar there are large cane factories without much land of their own?—A. That may be but in order for a factory to be successful it must have absolute control over at least one-fourth of the land on which its cane is grown.

Q. Do you think that is essential?—A. That is absolutely necessary.

Mr. A. Chatterton.—Q. Have you any experience of sugar cane cultivation in other parts of India?—A. Yes. I have been in most of the provinces.

Q. What would you consider as the best way of attacking this question of developing the cultivation and manufacture of sugar in India. Do you know the system that is being worked in the South of India. Do you consider that there is any considerable prospect of a successful development of sugarcane cultivation by the installation of small power factories for the manufacture of a higher class of jaggery or gur?—A. After I visited Mysore I came back with the idea that we might start a small factory on the same lines somewhere in Bengal. But here the conditions would be entirely different. If we could make a good class of gur none would go to the refinery. We have not so many concentrated areas. It is very hard to get 100 acres in a block. It is only in two or three places that the factory is likely to be successful in Bengal.

Q. In Bengal would there be any difficulty about putting up a central factory?—A. I do not think you could. The cane area is scattered and the growth is uncertain.

Q. They grow regularly year by year?—A. A very large portion of the Bengal cane is chewing cane. Bengal is a very large consumer of chewing cane.

Q. Do you think the lower classes of the country prefer gur to sugar?—A. This is my opinion. The lower classes prefer gur.

WITNESS No. 123.

Mr. R. S. Finlow.

Mr. R. S. FINLOW, B.Sc., F.I.C., *Government Fibre Expert, Bengal.*

WRITTEN EVIDENCE.

Technical aid.

Q. 15.—I joined the Indian Agricultural Service in 1904. I first came to this country to assist in chemical research work in indigo; but I was only directly connected with this investigation for about a year. Latterly I have made a special study of fibres, principally jute.

Q. 16.—I have written a separate note in which I have dealt in detail with improvements which are possible in connection with jute cultivation. Progress in agricultural research and in the application of its results has been comparatively slow in Bengal, partly I think, because the possible improvements are not quite so obvious as in some other parts of India and partly also, perhaps, because the cultivator is, on the whole, better off and not quite so easy to convince. He is now, however, showing in no uncertain manner that he is willing to take advantage of the results obtained by the Agricultural Department, and there is no reason for doubt that ultimately all the improvements suggested by the department will come into common practice. The raiyat is also taking kindly to co-operative principles, and

co-operative credit is bound to play a determining part, at least in regard to progress in directions involving outlay of capital.

Qs. 17 and 18.—Ordinarily a scientific expert would be able to offer advice, in the routine of his official work, to a private company whose enterprise is on similar lines. If the advice required is of a very special nature, the company, if wealthy enough, would retain its own experts; but if not the advisability of loaning a Government expert to such a company would, in my opinion, depend on whether or not the development of the enterprise would be a matter of public importance. In such a case it would seem fair that Government should have the determining voice in regard to the publication of the results of researches made by the expert; but it would also seem to follow that, in the case of such a special subject, Government would, in coming to a decision in the matter, be largely guided by the views of the expert himself.

Qs. 21 and 22.—I have consulted the Scientific and Technical Department of the Imperial Institute on several occasions, and have found it useful in obtaining commercial information and opinions regarding various fibre products. I consider that such an organization would continue to be valuable for these purposes, but with the development of the scientific departments in India, it would seem that, in the future, technical problems will be more and more advantageously worked out on the spot by officers possessing local knowledge in addition to a scientific equipment. The worker in India would certainly generally be in a better position to obtain, or if necessary, produce under his own control, the raw material for his investigations; but here again he would probably, on their successful conclusion, receive valuable aid from an agency in England in placing new or improved products on the market. It would seem that this could well be one of the functions of an Advisory Council for Research in England. Another function would be to constitute a central bureau to which manufacturers could communicate their ideas regarding improvements in the preparation of raw products, or any other needs of their respective industries which workers abroad could help to satisfy.

Q. 24.—If any organization were required in India whose functions would be similar to that of the Advisory Council for Research in England I would suggest that an enlarged and broadened Board of Scientific Advice might serve the purpose. The Board might consist of a nucleus of permanent members, as at present; but it should have the power, if that is not the case at present, of co-opting other members whose special experience would be of value in framing a particular policy. Such members would not necessarily be scientific men; it would be of use on many occasions to have advice of a sound businessman with a knowledge of the commercial aspect of the matter under discussion. It might not prove feasible to have a commercial committee of the Advisory Council, but periodical discussions with representative men, who might happen to be commercially interested in the investigations in progress, would almost certainly prove of great help to those engaged in the research.

Q. 25.—As far as my own work is concerned I consider a further survey of the fibre resources of India to be highly desirable. Such work could well be carried out in collaboration with the Botanical Survey and the Forest Service. Surveys for industrial purposes.

I can make no definite suggestions regarding the exact organization of such a survey; but in the case of fibres it would probably commence with the collection and investigation of material which is likely to be of commercial value either to existing industries or possibly in the formation of new ones. The staff required for such work could only be decided by experience.

NOTE ON FIBRES.

The fibres cultivated, or capable of cultivation, in Bengal are as follows :—

- (1) Jute :—*Corchorus Capsularis* *Corchorus Olitorius*.
- (2) Sann hemp :—*Crotalaria Juncea* (Son-pat).
- (3) *Hibiscus Cannabinus* :—Mesta pat, Bimlipatam jute, etc.
- (4) Flax.
- (5) Sisal hemp.
- (6) Rhea.
- (7) Coconut fibre.

Of these jute overshadows all others in the area devoted to its cultivation and the great volume of its trade.

JUTE.

[(1) *Information contained in previous publications* :—Papers are put up from which most of the information regarding jute can be gathered.]

(2) *Distribution of C. Capsularis and C. Olitorius* :—Briefly it may be said that *C. Capsularis* is generally cultivated all over Northern, Eastern and South-Eastern Bengal; while *Corchorus Olitorius* is more common in Western, South-Western and Southern Bengal. The division is roughly a climatic one; but an increasing proportion of *C. Olitorius* has been grown on high land in Eastern and South-Eastern Bengal of recent years. This is probably due to the pressure of the largely increased area under jute in Eastern Bengal; *C. Olitorius* is sown later than *C. Capsularis* so that the cultivation of both kinds tends to

prolong the sowing season and thus enable the cultivator to conduct his operations with less strain on his bullocks and himself.

(3) *Improvements as a result of the work of the Agricultural Department*:—(a) The work of the Agricultural Department in the last ten years has shewn that considerable improvements are possible, partly through the use of the improved seed and partly through improved agricultural practice, such as the application of suitable manures.

(b) *Seed*. In the case of seed for instance :—Carefully made field tests carried out in the present season (1916), with the aid of Calcutta jute firms at their mofussil agencies, have shewn that the departmental pure line seed is capable of better yields of fibre, as compared with the various local varieties, averaging something like two maunds per acre, or say 12 per cent. There is already a considerable demand for this seed: last year (1915) about 6 tons (150 maunds) were sold, this year (1916) 13 tons (350 maunds) are available and arrangements are being made to produce about 50 tons (over 1,000 maunds) next season.

(c) *Manures*. In the case of manures :—It has been shown that the application of lime, phosphates and potash to the red soil tracts results in considerably increased yields, averaging from 2-4 maunds of fibre per acre and, in addition, markedly improved *rabi* crops. It has been proved that such treatment results in considerably increased net profits and, as a result of demonstrations, cultivators in the red soil tracts are, with the aid of co-operative banks, already taking it up. The very pronounced lack of lime and phosphates which characterizes the red soil tracts is typical also, in a modified degree, of practically the whole of North-Eastern India and is, no doubt, due to the continued solvent action of the heavy rainfall which this tract receives. Away from the red soil however, *i.e.*, on the new alluvium, it is always possible to reap excellent crops after general, as opposed to special, manuring and under such conditions the conservation of the natural supplies of manure becomes a point of great practical importance. The losses of cowdung are very great, partly through its being used as fuel and partly through carelessness in regard to the storage of the remainder, and it is part of the programme of the district staff of the Agricultural Department to induce cultivators to exercise more care than they are in the habit of doing in this respect.

Experimental trials have recently shown that the water weeds, which grow in such quantity in some of the low-lying tracts, are particularly rich in manurial ingredients and that in a rotted condition or, after burning in the form of ash, they are capable of producing such increases in the crops cultivated as will amply repay the cost and trouble of their collection.

(4) *Estimate of potential improvement rendered possible by the work of the Agricultural Department*:—On the whole the degree of potential improvement in the jute crop of Bengal as indicated by experimental results now available, would appear to be in the region of 25 per cent., but the progress towards such improvement must take many years in the absence of a large and efficient district staff.

(5) *Help of co-operative credit societies in introduction of improvements involving expenditure of capital*:—In the dissemination of new knowledge and distribution of selected seed the Agricultural Department's district staff is a sufficient agency; but when the cultivator wishes to buy improved implements and expensive manures the aid of co-operative credit is usually an absolute necessity. A new implement may cost Rs. 20 and the purchase of manures may cost as much as Rs. 25 per acre. Such expenditures might, and probably would, be recouped several times over in the course of a year or two, but there are few cultivators who can afford to pay out a lump sum of Rs. 20 or more. Therefore without the help of co-operative credit the bulk of the cultivators would be unable to take advantage of many of the opportunities which are, as the result of the work of the Agricultural Department, open to them. Instances of collaboration between the Agricultural Department and the co-operative credit societies are already on record in Bengal, and these will multiply in proportion as the increased staff of the Agricultural Department is able to demonstrate items of improved agricultural practice to the cultivator.

Extension of Jute Cultivation.

(6) *Statistics regarding jute crop*:—In considering this matter it is instructive to note the rate at which the cultivation of jute has increased in recent years. In 1874 the approximate area under jute was returned as 920,000 acres which, at 3 bales per acre, would yield 27 lakhs of bales roughly. In 1902-03 the official figures give an outturn of 66 lakhs of bales; in 1904-05, 72 lakhs of bales; in 1909, 90 lakhs; in 1910, 81 lakhs; in 1912, 100 lakhs and in 1914-15, 105 lakhs. Thus the actual amount of jute produced has increased by nearly 50 per cent. in the last ten years and the same may be taken to be true as regards the area under the crop.

(7) *Increased production not sufficient to keep down prices*:—Even this enhanced production however was apparently not sufficient; for prices practically doubled in the same period and the one cry from the commercial community was for more fibre. A reasonable conclusion to draw from this is that, in spite of unprecedentedly high prices, the present tract in which jute is produced is not capable of furnishing all the fibre which is required.

(8) *No expansion in limits of jute producing tract*:—In Hem Chandra Kerr's report, written in 1874, it is stated that jute was cultivated in all but 11 districts of the old Bengal Presidency. Only one of these eleven districts grows jute to-day and that on a very small area. Obviously therefore there has been no expansion of the limits of the tract of country

over which jute is grown, in spite of the enormous increase in actual acreage under the crop. It follows that the proportion of jute to other crops has increased very greatly in this tract. In the districts of Dacca, Mymensingh, Faridpur and Tipperah the area under jute is over 25 per cent. of the net cropped area; in Bogra, Pabna and Rangpur it approximates to 20 per cent.; while in the 24 Parganahs, Nadia, Jessore, Hoogly, Howrah and Rajshahi it varies from 10 per cent. to 15 per cent. In the whole province of Bengal jute occupies 12 per cent. of the total cultivated area.

(9) *Interdependence of the respective amounts of rice and jute cultivation*:—In this connection it is worth noting that in the period 1910-1914, which was an era of uninterrupted high prices for rice as well as for jute, the area devoted to rice in Bengal fell by 1,700,000 acres, and the total area under food grains shews a similar decline; since the commencement of the War, which caused a shrinkage of over 25 per cent. in the area under jute, rice cultivation has shewn a rapid and progressive recovery. It is practically certain that the whole of the increased area put under jute in the period 1910-1914—roughly 400,000 acres—was at the expense of food grains; but even then there is an area of over a million acres which cannot be accounted for by the statistics available and which apparently went out of cultivation; in fact it would appear that the increased area put under jute caused a much more than equivalent reduction in the area of food crops. There are two possible explanations; firstly that the profits from jute were so great that the cultivator felt he could afford, if not to buy food, at least to stop producing more than he needed for his own consumption; secondly that the labour of producing so large a quantity of jute, the extraction of which clashes in time with the planting of rice, made it impossible to carry out the latter less profitable operation to a normal extent. Probably both of these reasons tended towards the result which, in any case, and despite a considerable increase of population during the period, amounted to a serious diminution of the staple food supply of the province. (N.B.—The population of Bengal increased by 3½ millions in the decade 1901-1911.) How far such a process can go on is a question which I do not pretend to be able to discuss in all its bearings; but although increased yields of food crops will be made possible by the work of the Agricultural Department, it would seem that, as far as present conditions are concerned, Bengal will soon reach the limit of economic safety, if it has not already done so, in regard to jute production.

(10) *Insufficient labour for increased production of jute in Bengal*:—How far the present labour supply is capable of dealing with a largely increased substitution of jute for other crops in the present jute growing tracts is of greater importance than it appears at first sight; for it cannot be doubted that jute cultivation involves considerably more labour than rice. People who have been in the jute trade for many years are almost unanimous in believing that the quality of jute brought into the market has not been so good in recent years. Of course there are spasmodic variations in quality which are due to seasons which are suitable or, otherwise; but, there is a strong and general impression that outside this, there is a tendency towards continuous deterioration. That this is not due to the plant is certain; it is possible to grow as good jute to-day as ever it was and, given good retting water and careful preparation, the results are entirely satisfactory. It has already been remarked that jute cultivation involves considerably more labour than rice and the reaping of the crop and preparation of the fibre is one of the most exacting stages in its production. If, therefore, the cultivator is coming to a point when he tries to cultivate more jute than he can conveniently manage, one of the most obvious signs will be a tendency towards more and more careless preparation, and this is just what appears to be happening.

(11) *Importation of labour*:—This difficulty is to some extent mitigated by the employment of outside labour; for every year large numbers of coolies migrate eastwards from the overcrowded districts of Bihar and the United Provinces, more especially to the jute growing districts of Northern Bengal. The supply of such labour however is not only limited, but it is expensive and, through lack of experience, often inefficient. The result is an inevitable rise in the cost of production of jute as well as a deterioration in the quality of fibre obtained.

(12) *Proportion of jute to other crops in Bengal approaching its limit*:—There appears to be some reason therefore for the contention that, the proportion of jute to other crops in the jute producing tract is also approaching its limit.

(13) *Probable continued increase in the demand for jute. Methods of increasing the supply*:—On the other hand there is certainly no ground for believing that the demand for jute is likely to slacken more than temporarily, and it behoves us to examine the position in order to see how any further increase is to be met. There are three possible ways, viz.:—

(1) By improving the yield of fibre in the present jute production area.

(2) By extending the cultivation of jute to other tracts where it is not at present grown.

(3) By the cultivation, in tracts which are not suitable for the production of jute of other plants whose fibre is sufficiently similar to be used as a substitute for jute.

(14) *Improved yields of jute fibre*:—Taking these points in order:—The work of the Agricultural Department must lead to considerably enhanced yields, not only of jute but of other crops by means of improved methods of cultivation and manuring. The ultimate possibilities in this direction, as far as jute is concerned, may be put at something like 25 per

cent. or, say 25 lakhs of bales; but the actual realisation of this increase will be slow, for not only are the cultivators conservative but their number is very great, their holdings small and they are spread over an area as large as Great Britain.

(15) *Possible new areas*.—Regarding new areas in which jute cultivation could extend—the natural outlet would of course be the plains of Assam which are, by reason of the prevailing conditions of soil and climate, peculiarly fitted for jute cultivation. There is indeed little doubt that this tract is capable of supporting at least another million acres of jute without unduly straining the proportions between jute and other crops. The lack of population in much of the greater part of Assam, is however an almost insuperable bar in the way of any rapid extension and, although numbers of Bengalees from the crowded southern districts are beginning to emigrate to Assam, it would appear that by nothing short of a wholesale colonisation scheme can progress be made otherwise than very slowly.

(16) *Possibilities of extension in Bihar*.—In Bihar, Purneah is a very large jute producing centre but Cuttack is the only other district which grows more than 10,000 acres of jute. High prices in the years 1905-06 caused about 10,000 acres of jute to be grown, in 1907-08, in the districts of Muzaffarpur and Champaran, but the area fell again later partly owing to lower prices and partly to lack of market facilities. Since then jute cultivation has again shewn a tendency to increase but not to the extent which these areas are capable of supporting it. There are large areas in North Bhagalpur, and probably also along the Terai in North Darbhanga, where the production of jute could almost certainly be made profitable. The edges of the numerous "chars" or depressions in Tirhoot, where sowing could take place early in the year—in February—are capable of growing very fine crops of *C. Capsularis*. The fact such land goes under water in the rainy season to the depth of several feet has its parallel over large areas of the greatest jute growing tracts in Bengal. It is not even necessary that a pure crop of jute should be grown; a common custom in portions of the Dacca district is to broad-cast rice and jute together, the value of the respective yields being from one-third to half for the jute and from one-half to two-thirds for the rice. Thus, while a food crop is assured the monetary return is almost uniformly better than that from a pure rice crop. Such a practice is worth trying in Bihar. Another point worthy of investigation is how far *C. Olitorius* could be grown on the higher lands: the desi jute in districts near Calcutta is not often, on account of scanty rainfall, sown until late in May, or even the beginning of June. Such conditions approximate quite reasonably closely to those of Bihar, and I know that the production of successful crops of *C. Olitorius* in good high lands there to be more than a possibility. In most parts of Bihar cheap water communication with Calcutta is a very great advantage to start with.

(17) *Cultivation of substitutes in tracts not suited for jute*.

Hibiscus Cannabinus.—Outside the abovementioned tracts it is doubtful if, under present circumstances, jute could be profitably cultivated on a large scale but the question of jute substitutes is one which is of considerable interest in this connection. There would be no object of course in introducing such a substitute into Bengal which is the home of jute; but there are plants, whose fibre approximates closely to that of jute, which are capable of thriving under conditions, which would be quite unsuitable for jute. Of these, *Hibiscus Cannabinus* (Bimlipatam jute), which is to be met with in cultivation in nearly every part of India, is the most promising. Its fibre, as I have said, is similar in many respects to jute although, naturally enough, it is not looked on with favour in Calcutta. It has, nevertheless, especially certain varieties of it, a stronger, and probably a more durable, fibre than jute and, for this reason alone, if for no other, its cultivation is worthy of encouragement. It is produced on a considerable scale in Madras where there is a fluctuating area of between 50,000 and 80,000 acres in the East Coast districts. A gunny mill whose annual consumption is said to be about 25,000 bales has existed for many years at Bimlipatam and it was proposed to erect another one at Ellore in the Kistna district. It is worth noting that *Hibiscus Cannabinus* is also cultivated throughout Bombay and especially in Bihar and the United Provinces, so that a comparatively small percentage increase, over such a large area, would have a very considerable effect on the aggregate supply of fibres of the jute class.

(18) *Wide possibilities of Hibiscus Cannabinus*.—During the last ten years I have consistently advocated the merits of *Hibiscus Cannabinus* fibre as an acceptable substitute for jute and it seems advisable to recall the actual facts:—

A considerable shortage in the supply of jute in the period 1904-06 had led to high prices and a very large amount of fraudulent watering, in consequence of which Government was faced with a demand for penal legislation. It was wisely decided that the adjustment of the discrepancy between supply and demand by the production of large quantities of fibre of the jute class was the real remedy, and the efforts in regard to the improvement of jute in Bengal are one result of this policy; but in view of the profit to be obtained from the cultivation of fibres, it was considered advisable to investigate the possibilities of other parts of India in this respect. In 1905 at the instance of Mr. F. G. Sly, I.C.S., then Inspector-General of Agriculture, I made an extensive tour through India with this object in view, and an account of the tour was published in bulletin No. 3 (1906) of the Agricultural Research Institute, Pusa.

The recognition of the possibilities of *Hibiscus Cannabinus* as a substitute for jute was one of the most important results of this investigation, as the following quotations show:—
"..... it (*Hibiscus*) possesses the properties which render it a reasonably efficient substitute

for jute. It can be grown with success under the conditions of soil and climate which obtain in most parts of India and consequently is capable of much greater extension than jute, which requires, it would appear, more favourable conditions of soil moisture for its development." In Madras, "... it is capable of being produced in such a scale as to afford considerable relief to the present position of the jute trade."

"But it is not only in Madras that Bimlipatam jute can be successfully grown as a pure crop. It is common throughout Bengal, Bihar, Bombay and the United Provinces as a mixed crop and as the figures already quoted show that the cultivation as a pure crop returns a good profit—better than most other field crops—there is no reason why there should not be an almost unlimited supply of its fibre."

(19) *Selected seed of Hibiscus Cannabinus available*:—In Madras, where Hibiscus is grown as a pure crop, there are two or three types of which a straight growing red variety called *Yerra Gogu* is considered by cultivators to be—and is in reality—much the best as a fibre producer. An investigation of these races of Hibiscus was originally undertaken about 1905 in collaboration with Dr. Barber, Government Botanist, Madras, but ultimately the seed samples were handed over to Mr. Howard of Pusa, who has produced pure cultures and investigated the conditions under which the crop must be grown to avoid contamination by chance crossing. The department is thus practically ready to supply pure seed of the best kinds of Hibiscus in quantity to the cultivator.

(20) *Bimlipatam jute in European markets*:—It is important to observe that spinners in Europe who are in the habit of using Bimlipatam jute speak well of it.

There is a considerable export of the surplus Hibiscus fibre under various names such as Bimlipatam jute, etc., from Madras to London and Dundee, where it is a recognized item in the jute market, and where it is bought for purposes for which jute would otherwise be required. The buyer of jute is thus relieved of a corresponding amount of competition. It is worth remembering that in this case also it is by no means necessary to grow a pure crop of Hibiscus Cannabinus; indeed, excepting in Vizagapatam, parts of Eastern Bengal and in the Purnea district, it is more commonly mixed with food crops.

(21) *Further experimental investigation necessary*:—There are thus considerable possibilities for the production of jute, or of fibres similar to it, in parts of India outside Bengal, or the portions of Bihar and Assam, where jute cultivation is already carried out on a large scale. No one will deny that jute has brought great riches to this latter tract; but there are indications that it is approaching its limits. In view of this I suggest that the investigation commenced in 1905-06 be re-opened to determine finally the possibilities of other parts of India, and especially Bihar and the United Provinces, as regards the cultivation either of jute or of similar fibres. It is possible that while the War lasts the demand for jute will not be so great as it was before hostilities commenced: moreover there may be a considerable period of trade depression after peace is declared; but ultimately we are bound to see a recrudescence of the demand for sacking fibres, and I submit that the interval is a favourable time in India for establishing a policy in this on a basis of experimental results.

(22) *Artificial substitutes for jute*:—It is certain that artificial fibre is already being used to some extent by Germany for sacking; and complete shutting off of supplies of jute has rendered the production of artificial fibre on a large scale a necessity. The progress in the manufacture of artificial fibre is not however confined to Germany; for there are now several factories in America which are engaged in making all classes of goods, from carpets to sacking and twine. There are also mills in England, one of which is using a waterproofing process, which overcomes the tendency of paper textiles to disintegrate when wetted. It is not contended that these goods are superior in all respects to those made of jute: indeed it is pointed out as a disadvantage, that they are generally considerably heavier. On the other hand they have superior strength and, most important of all, they can already be produced more cheaply than jute at anything like its present price: further, though it is not at present contended, outside Germany, that they are intended to compete with jute, there can be little doubt that they will become more and more capable of doing so as methods of manufacture become more perfect.

(23) *Competition of artificial substitutes to be borne by grower*:—It is impossible at present to say definitely whether or not artificial fibre is likely to be a serious competitor of jute; but it may be too late if we wait until we have the answer to the question, and the obvious sound policy is to take due precautions. Undoubtedly the best protection against such a menace is an enhanced production of natural fibre; so that prices, while ensuring a good profit to the grower will not soar to fabulous heights, as is the case at present. The danger is rather to the cultivator than to the manufacturer; for if it paid him to do so, the latter would adjust his machinery to work on the new product and the whole of the competition would ultimately fall on the grower of jute, just as it did on the indigo planter.

(24) *Interests of cultivator and manufacturer identical*:—The cultivator has therefore at least as much interest as the manufacturer in seeing a better balance between supply and demand than there is at present in the case of raw jute; for even though he might then receive rather less for the fibre he produces, he could look forward with certainty to an undisturbed permanency of moderate profits.

In this connection the following quotations from a note written in November 1913 by the Chairman of the Indian Jute Mills Association is *apropos* :—

"Jute, raw and manufactured, now occupies the first place in the export trade of Bengal. During the past year, 1912-13, it represented over 50 per cent. of the foreign export trade of Calcutta, as follows :—

	Rs.
Jute, raw	24,48,99,531
Jute, manufactured	22,76,62,513
	<hr/> 47,25,62,044

to which must be added :—

(1) Jute, raw, exported from Chittagong	2,48,18,000
(2) Jute, manufactured, exported to Indian coast ports	2,74,00,000
(3) Exports by rail and river, tons 99,500 valued at say	3,98,00,000

TOTAL	56,43,80,044
-----------------	--------------

"This year the value of the jute trade to Bengal will be still greater and surely it is not too much to ask that Government should take a more active interest in the cultivation and extension of a crop which directly or indirectly brings into the province from 50 to 60 crores of rupees annually.

"It would be nothing short of a national disaster if India and Bengal in particular were to lose the jute trade.

"The decline in the Bengal silk trade is said to have been due to the prevalence of silk-worm epidemics or to some other causes outside Government control. There is little risk of insect pests being made the excuse for any decline in the jute trade and so long as jute provides the cheapest material for packing and wrapping purposes there is little likelihood of any interference with India's monopoly of the trade in this raw material. But if prices of jute, both raw and manufactured, are to remain at present high levels no efforts will be spared to provide substitutes or to discover other means of handling the produce of the world.

"Already elevators, wagons and steam vessels are being constructed all over the world for the handling of grain in bulk. The crops in Canada are nearly all brought to market by this means. On the West Coast of North America efforts are being made to introduce the same system. In Australia Government's sanction has been given to the expenditure of large sums of money for the like purpose and even in India elevators are being erected for the storage of wheat.

"It is bad enough to find outlets for jute manufacturers being closed in this fashion but worse still is the knowledge that substitutes for raw jute are actually being discovered. The following extract from the Dundee Trade Report, dated 3rd September 1913, explains the position :—

Textilose versus jute.—It would appear as if textilose were making progress in the different countries. It is stated to us that the price of paper yarn is little more than one half of the price of jute yarn at present high prices.

The textilose business is in the hands of a French Syndicate. We are informed that a new Association is being founded with a capital of 23,000,000 francs to establish the production of textilose in different countries. Apparently the right to manufacture is sold for a sum of ready money, and in some cases an interest is acquired in the different undertakings by the ruling syndicate, while royalties are also paid according to production or the guaranteed quantity.

Textilose yarn is a mixture of paper and cotton waste which is believed to be infinitely superior to all paper yarn. Fabrics made of textilose warp and jute weft are also greatly superior to the fabric manufactured from purely textilose yarn. This industry is in its infancy, whatever may become of it.

France.—At Rethel there is a small factory of 80 looms capable, however, of considerable development but there is great scarcity of workers. Production seems to be easily disposed of.

The jute mills have offered a sum of money in order that they shall not be competed with.

Germany.—There are two mills exclusively for textilose and one under construction. There is a mill at Adorf and another at Oppeln, and a third going up in west Germany. They have not come to an agreement with the jute mills in Germany.

Austria.—At Fleissen a mill was put down, which was bought up by the jute syndicate. The Austrian Jute Syndicate have undertaken the production of textilose, and have bound themselves to produce a large quantity per annum. There is an Association in Austria and also in Hungary, each with a capital of 5,000,000 Austrian kronen.

Italy.—The rights have been acquired by that country, in which venture the Syndicate also has an interest.

Spain.—There also is a company. They are setting up a mill to make paper yarn for themselves.

Brazil.—Textilose has also been taken up in Brazil and the patent right purchased.

North America.—A company has been formed and the necessary arrangements concluded with the Syndicate.

England.—Textilose is also of course in operation in England. There is a company in Manchester.

"India already has had a costly experience of the result of cheap and efficient substitutes being found for the natural article. Less than 20 years ago India had 1,688,042 acres under indigo producing 237,494 cwts. Now only 214,500 acres are under cultivation producing 37,600 cwts. only.

"Can the Government of India and the Government of Bengal afford to look on idly and watch jute follow indigo?"

"Scarcity of milling plant and absence of local demand for manufacturing purposes may be sufficient reasons for Government not giving more encouragement to the cultivation of sugarcane. The prevalence of silkworm epidemics may be the cause of the steady decline in the silk industry. The introduction of cheap aniline dyes is no doubt the explanation of the decayed condition of the indigo trade. But so far as can be ascertained there is no excuse for the "laissez faire" policy adopted by Government to agriculture in general and jute in particular. There are already mills in Bengal consuming more than half the total crop of jute. Capital, machinery and labour are and will be forthcoming to consume all the raw material that Bengal can supply. Last year jute mills' machinery to the value of Rs. 86,36,021 was imported from Britain into Calcutta for new mills and extensions of existing premises, and imports for the current year are also very heavy, as more new mills and extensions are still under construction. Surely it is up to the Government of India and to the Government of Bengal to spare no efforts for the encouragement of jute cultivation."

(25) *Artificial retting* :—There is another aspect in regard to jute which is assuming increasing importance. In the early eighties the question of jute production in the Southern State of America received thorough attention from the Government Agricultural Department. Good crops were grown; but the retting proved so serious an economic stumbling block as to put success out of reach. One of the conclusions drawn by the officers in charge of the experiments was that, while the ordinary methods of retting and stripping rendered jute production impossible in the Southern States, the position would be completely changed by the advent of a successful artificial process of extraction. Since that time trials with jute in otherwise suitable tracts in various parts of the world have failed uniformly over retting and stripping. Numerous patents have been taken out; but hitherto none has come into use. *Witness here gave confidential evidence.*

(26) *Necessity for broad policy based on experimental investigation* :—Nevertheless it must not be forgotten that the advent of artificially extracted jut fibre, which appears to be imminent, will certainly, as already pointed out, help the ceaseless efforts which have been, and are still being, made to grow jute in other parts of the world. Thus we are again faced, from another aspect, with the necessity of broadening our policy in regard to the production of fibres of the jute class in India. Such a policy can only rest on an experimental basis, and it is most advisable that the necessary results should be obtained as soon as possible. The cultivation of jute has been of great financial benefit to the Bengal raiyat and its extension into other tracts, or the increased cultivation of similar fibre crops, is not likely to be less beneficial to the inhabitants of these tracts. On this account we should be prepared beforehand with the experimental data, so as to be able to grasp the opportunity when it comes.

(27) *Effect of artificial extraction in helping increased cultivation of sann hemp* :—Wholly, or partial, artificial extraction would also greatly help towards an increased production of valuable fibres like sann hemp (*Crotalaria Juncea*) in the Central Provinces and in the Punjab. In both these tracts the lack of retting facilities, as well as of labour required for stripping, not only severely limits the amount of fibre produced, but is the principal cause of its inferior quality, which has been the subject of so much adverse comment in recent years.

(28) *Sann hemp (Crotalaria Juncea) in Bengal* :—Compared with jute the importance of any other fibre in Bengal is small; the total of "other fibres" than jute in Bengal is only about 30,000 acres nearly all of which is sann hemp, and the main object of much of this is to make use of the fertilizing action of the sann hemp plant for the subsequent jute crop. From this it will be gathered that sann hemp in Bengal is largely a cold weather crop, it is only in parts of Western Bengal, such as Rajshahi, that it is to be found as in the rainy season. Practically the whole of the cold weather sann hemp cultivation is carried out in the Pabna district where there is a regular trade in its fibre. The only other districts where a perceptible amount is to be found are Chittagong and Mymensing. In the former the object is fibre production; but in Mymensingh the crop is largely fed off by cattle as a preliminary to jute cultivation.

There is no large scope for an increase in sann hemp cultivation in East Bengal. The conditions are not suited for it in the rains, and in the cold weather ample soil moisture for the production of sufficient length, and convenient water for retting, are necessary. Outside Pabna perhaps these conditions might be realized in parts of Faridpur, Noakhali and Bakherganj, but it is not likely that any such extension could ever, assume first class importance. On the other hand it is quite possible that a considerable development of monsoon sann hemp cultivation might take place with advantage in those parts of West Bengal where jute would be a precarious crop. The yield of sann is less than that of jute, but its price is higher and has been steadily rising for the last six years. Under these circumstances and considering its fertilizing action on the soil it is quite possible that it might prove a more satisfactory field crop than jute.

(29) *Hibiscus Cannabinus*:—This plant is only cultivated to a small extent in Bengal. It is cultivated under practically the same conditions as *Corchorus Olitorius* and as the latter yields a heavier crop of fibre there is no object in attempting to exploit *Hibiscus Cannabinus* as a substitute in Bengal. *Hibiscus Cannabinus* is however capable of growing satisfactorily on a less rainfall than would suit *Corchorus Olitorius* and for this reason it has claim to serious consideration if means of increasing the production of fibres of the jute class outside Bengal are to be investigated. It is widely cultivated throughout India and in Vizagapatam it is one of the staple monsoon crops. Elsewhere it is chiefly grown to provide home made ropes, but a considerably larger area is almost certainly possible. Its fibre is a well known and recognised item in London and Dundee where it is used for purposes for which jute would otherwise be required and although it is not looked on with favour in Calcutta it would seem nevertheless that it is capable, if necessary, of relieving pressure on the jute to a very considerable extent. The possibilities of this crop as a substitute for jute have already been discussed.

(30) *Flax*; *Linum Usitatissimum*:—The cultivation of linseed as a grain crop is common in all parts of Northern India; but it is never grown for fibre. Although botanically identical, the cultural differences between Indian linseed and European flax are considerable. The stem of the former is short, often very branched, woody, contains very little fibre of brittle nature and the plant produces a large amount of seed; the latter is a much more delicate plant growing as a single straight stem, which in the best varieties is hollow like a corn stalk, containing very little wood and a comparatively large portion of fibre. Each plant has in fact been specially selected for the purpose for which it is cultivated. It follows that the Indian linseed is entirely unsuitable for the production of fibre.

Experimental cultivation of flax:—Numerous attempts have been made to introduce the cultivation of European flax for fibre into India, but none has yet succeeded in establishing it as a staple crop in any tract. The most recent, as well as the most systematic, trials took place in Bihar between 1908 and 1913 under the joint auspices of the Government of India and the Bihar Planter's Association. These trials showed that excellent flax can be grown in Bihar and that a reasonable profit can also be obtained. The cultivation of the crop however needs special care and the extraction of the fibre is an intricate process which needs expert supervision.

In the United Provinces, on Government farms and with irrigation, even better results have been obtained than in Bihar and attempts have been made to induce cultivators to grow the crop; it is too early yet to say whether these attempts will succeed, but it is fairly certain that central retteries will have to be established if the best quality of fibre, and consequently the best monetary return, is to be realized. Very good flax has also been grown in Assam but nothing can yet be said as to its ultimate prospects and the same may be said of Kashmir.

The crop grows well in Northern Bengal but it remains to be proved whether there is room in this province for flax, as well as jute.

Co-operative retteries:—It would appear in the case of flax, as with other crops which require mechanical treatment, that if a sufficient number of cultivators take it up, each on a small scale, their united produce would suffice to keep a central factory working. The factory might be a co-operative one controlled by the cultivators or, it might be a separate enterprise.

(31) *Sisal* (*Agave Sisalana*):—Sisal is one of numerous members of the Agave family whose exploitation has been proposed in India. In other parts of the world, *vis.*, Mexico, the Bahamas, and specially in East Africa, German and British, sisal cultivation is a thriving industry. The Indian experiments seem to have been commenced under a wrong impression, *vis.*, that sisal thrives in poor soil better than in good land. In East Africa the plantations are on rich soil of volcanic origin: moreover they have the advantage of two rainy seasons in the year. Sisal planters in India also began at an unfortunate time, just before the beginning of a period when prices fell to an artificially low level. It would seem that at £20 per ton there is little profit to be made; but in the last five years, even before the War, prices have been decidedly above this level and well established concerns have made money, especially since the War began.

So far, sisal, like flax has only been a capitalist's crop but as in the case of rhea there seems no reason why a cultivator should not grow a few plants: there are quite simple implements capable of producing good fibre, which would always have a ready sale.

(32) *Rhea Boehmeria Sp.*:—The position regarding rhea is described in detail in Mr. Coventry's article and in my review of Mr. Carter's book. Rhea cultivation is very rare in

India, being apparently confined to Assam and Northern Bengal. In Northern Bengal it is only grown by low caste cultivators for use in the making of fishing nets and the plots are always very small—1-20 acre or less. Extraordinary amounts of manure are applied—far more than would be possible on a large scale and very careful drainage is also provided. The fibre which is extracted by simple manual treatment is very like "China grass". Under present circumstances it is not in the least likely that rhea will be cultivated in India for export: on the other hand, if the growing of the plant as well as the degumming and spinning operations were in the same hands the higher price to be obtained for the filasse might offer sufficient inducement for an extension of cultivation.

(35) *Cocoanuts*.—Cocoanut cultivation is a considerable and increasing industry in the coast districts at the head of the Bay of Bengal and the following are approximate statistics for the number of trees in the respective districts.

	Approximate number of cocoanut trees.	Average number of fruits borne per tree per annum.
Noakhali	660,000	Between 30 and 50.
Tipperah	259,000	
Backerganj	2,731,000	
Faridpur	15,000	
Khulna	1,659,000	
Jessore	662,000	
Nadia	621,000	
24-Parganas	2,840,000	
Howrah	803,000	
	10,050,000	

There were thus, at the time the census was taken over ten millions of cocoanut trees in the districts at the head of the bay. These figures are some years old and it is said that there has been a marked increase in recent years. It is estimated that there were between 50 and 60 millions of trees in Ceylon at the same date. At present practically all the Bengal nuts are exported whole, i.e., in the husk; in some places it is said there is a small oil crushing industry; but the number of nuts affected is very small. In no case is there any mention of use being made of the coir, or husk fibre, which is such an important industry in South India, and I suggest that this is a matter which is worthy of investigation. At present there are practically no data and it has even to be determined if the coir would bring such a price as would induce the Bengal cultivator to take up its extraction; for it has to be remembered that the cost of labour in Bengal is greater than in Southern India. Information from the Government Botanist, Madras, is to the effect that about 3,000 husks yield one kandy (720 lbs.) of fibre which costs about Rs. 35 to produce and sells usually for from Rs. 40 to 50.

There are a number of varieties of cocoanut of which Moon (1824) enumerates eight, with 16 sub-varieties, and it remains to be seen if the common tree in Bengal is the most suitable for fibre production.

Lastly the cocoanut trees in Bengal, though usually on land surrounding villages, are not to be found in large groves, such as is the case in Madras and Southern India.

It is thus impossible to make any definite statement regarding cocoanuts; but there is obviously sufficient reason for an investigation which will yield definite information.

ORAL EVIDENCE, 8TH DECEMBER 1916.

President.—Q. Are you a regular officer of the Agricultural Department, or are you just a temporary officer?—A. A regular officer.

Q. How long have you been out?—A. I came out in 1903.

Q. You have had quite a long experience?—A. I think I am one of the oldest members of the Agricultural Department.

Q. Considering some of the general propositions here, apart from the questions in your special line, you suggest the enlargement and broadening of the Board of Scientific Advice to act in India as an institution corresponding to the Advisory Council for Research in England. The system adopted there is a little different to that which you propose for India. They have a small Council and under that small Council a series of specialised Committees. The special Committees include a certain number of commercial men who are interested in the application of scientific and technical research. In that way they think they are getting a closer discussion of problems that are before them, and they are also preventing the discussion of problems in science by a large number of men who are not interested in any particular problems. They save time in that way, and can also get together these Committees more readily than they could a large body such as would be necessary to cover all forms of scientific knowledge. What applies at home in the last respect applies also to India where distances are great and it would be difficult to get together; for instance in the Punjab there are only two or three men to attend frequently meetings of a Board of that kind. Do you think that the scheme adopted in England is more appropriate for India, or the scheme you suggest?—A. My idea was that of a Committee, I did not state it in so many words. My idea was a series of Committees for special subjects.

Q. The Board of Scientific Advice might still be enlarged to a certain extent to cover the big groups of subjects. I am not prepared to offer any opinion on that point, but you would not like it enlarged so as to include all the necessary scientific men together with business men who would be interested in turning these researches to commercial account?—A. I think I have suggested something in these words, *viz.*, a nucleus of permanent members, and that the members of the various Committees might be co-opted as circumstances might require. Your description of the Board at home agrees practically with my ideas on the subject. I don't think it would be possible to have a big Board to discuss everything, on account of the distance alone.

Q. In your study of the question of fibres in India, do you require yourself anything like botanical knowledge, or would it be sufficient to refer your purely botanical problems to an appropriate department?—A. My work has not involved much purely botanical work, but where the latter has been necessary, I have usually collaborated with a botanist.

Q. I have been told that cases of this kind occur, where a botanist would determine species of plant in the ordinary way, but would not be able to distinguish between the varieties until they were actually grown, and that in some cases a variety may be a valuable plant, from the point of view of yielding fibre, whilst another variety may be entirely worthless?—A. That is quite true; there are only two botanical varieties of jute.

Mr. C. E. Low.—Q. Cultivated jute?—A. Yes, but each variety of jute comprises a large number of races which differ considerably in their respective fibre yielding capacities.

President.—Q. Do you think that the work in connection with fibres generally in India would be sufficient to occupy anything like, say, half a dozen technical specialists for a fairly unlimited number of years in research work, and in encouraging the development of these industries?—A. I think, to begin with, you would have to establish that there is a case. Of course in Bengal the jute industry is a very big one, but outside that, as far as the jute class of fibre is concerned, it is not a very big thing. You will have to prove first of all that there are possibilities before you engage a very large staff.

Q. To prove a negative case you would require a good deal of time for one fibre expert?—A. I mean in making experiments to see whether for instance the cultivation of jute in a particular tract would be a paying proposition. That would not take very long.

Q. And even to condemn other fibres as more or less worthless would take a fair time?—A. Oh, yes, it would probably take two or three years.

Q. Do you think that the question of dealing with fibre-producing plants is in itself a speciality, in the sense that it is better to have one expert, or at any rate a group of experts specialised in fibres, or a number of men; for instance, for your specialisation, to adopt the line of having one taking an interest in jute and another in flax, and a third in cotton, and so on?—A. I should separate the cotton from the others.

Q. Because it is so purely agricultural, and its fibrous qualities are already dealt with?—A. It is a different class of fibre from others; flax and jute are fairly closely allied in the sense that both are stem fibres and that similar methods are used in their extraction.

Q. When you take jute and sann hemp and Hibiscus Cannabinus and cocoanut fibre, you will have enough problems to occupy more than one man?—A. Certainly, eventually, but with the exception of jute and sann hemp and a certain amount of Hibiscus in Madras, there is not very much at present. For instance, there is practically no flax grown for fibre in India. Experiments have been made to prove that it can be made to pay in Bihar and some experiments have also been made in the United Provinces, where they are trying to give the flax out to cultivators to produce. One cannot say, however, that there is production to any extent.

Q. You have not exactly got on to the point that I have been trying to develop. I notice you have dealt largely with the cultivation of jute; the conditions under which it is grown. You have dealt largely with the agricultural aspect of the jute question. I want to know whether there is such a thing as a fibre expert who is not necessarily conversant and would not be conversant with the agricultural cultivation of the plant giving rise to fibre?—A. I think the fibre expert ought to have the agricultural knowledge.

Q. Work from the agricultural side?—A. I think that ought to be included in his work.

Q. Judging of the value of the fibre, its qualities, etc., who would do that for you; if, for instance, you were replaced by an ordinary agriculturalist or an agricultural chemist without special experience in fibres would that be easily done by an ordinary agriculturalist?—A. You mean the commercial valuations? If I want commercial opinion on fibre, I ask a man who is in the trade, usually someone in Calcutta. There are some fibres that are not used in Calcutta. The Calcutta man would say that this kind of fibre is not in much use in Calcutta, and he would only give a nominal value for it. In this case I would send it elsewhere.

Q. In that case you would not get a favourable opinion unless it was a good fibre-producing plant?—A. Probably not; they say they have no use for it.

Q. You have no means of developing the plant up to standard; or can it be brought up to standard by improved agriculture?—A. From commercial opinion and one's own knowledge, one would be able to judge of its possibilities and decide whether or not it would be worth while continuing work on it.

Q. Have you got any laboratory methods of obtaining preliminary values with regard to fibre, the same as one does with reference to minerals, without getting actual commercial valuations?—**A.** One can distinguish comparatively easily between different fibres.

Q. And to that extent any ordinary technical man ought to make generally an expert?—**A.** I think certainly a fibre expert should have technical knowledge in addition to his agricultural knowledge, otherwise he would be working in the dark a good deal. I am myself a chemist by profession.

Q. I am thinking what would happen to the whole of this institution if anything happened to you. We heard of a case this morning of a good officer who had been transferred from a promising series of experiments to relieve another one in a different province; the whole of his work absolutely collapsed?—**A.** Yes, that is temporarily true in the case of Mr. Annett.

Q. It would be equally true if you were transferred to another work?—**A.** Yes, the other man would have to begin more or less as I began. But my work on jute has gone so far now that it is gradually passing out of my hands into those of the Deputy Directors and their district staffs. The seed is going out in large quantities and will continue to do so in increasing quantities and I anticipate that the time will soon arrive when my control over the jute work in Bengal will become largely mechanical, *viz.*, to ensure the constant flowing out of a supply of pure seed for multiplication on a large scale by the seed producers.

Q. Still there is no such thing as an industry standing still. As soon as the fibre becomes established, somebody sets up an opposition to fibre, and unless it goes ahead, it will soon find itself knocked out?—**A.** I would be glad to have another man working on the same lines as myself; in fact we are about to make proposals to that effect.

Q. What is your idea as to how that man should be employed; would he come in as a normal member of the Agricultural Department?—**A.** Yes, a man in the junior grade who will work up to that. That is our idea at present.

Q. He would go into a blind alley as a fibre expert, never rising to anything above what the Government consider worth while to pay for a fibre expert?—**A.** He would be on the ordinary service grade, I presume, which would be the same as for a chemist or a botanist.

Witness subsequently forwarded the following note relating to this question.

The question seems to raise a point regarding the advisability of delegating an officer to devote the whole, or practically the whole, of his time, for as long a period as may be necessary, to making a special study of a particular crop or class of crops. There is a distinct tendency in this direction, not only in the Indian agricultural service, but also, for instance, in the American Department of Agriculture and the policy has, in the case of the Indian department at any rate, been justified by results.

It would be unfortunate if the impression should gain ground that, even if his investigations lead to successful results, the prospects of an officer are likely to suffer by his becoming a specialist in this sense. His technical knowledge as a chemist, botanist or agriculturist is continually employed and developed during his investigations and, at the conclusion of the latter, the presumption is that his experience will make him a more valuable member of his profession than before their commencement. The difficulty seems to be at least partly a question of nomenclature; if so, this should be remedied and, in any case, the matter should be thoroughly discussed, if only to avoid disappointment and its inevitable reaction on the work of an officer employed as I have described.

Mr. C. E. Low.—**Q.** You give an account of improved jute seed which you are getting out: where is that produced?—**A.** At present we are producing it in Bihar and Assam.

Q. On whose lands are you producing it?—**A.** In Bihar; Pusa is growing a certain amount, and also the planters.

Q. Is that an agency which you think can be expanded sufficiently to serve any appreciable portion of the jute areas in Bengal?—**A.** I think so. One acre of jute in Bihar, I think, would produce somewhere between 7 and 10 maunds per acre of seed. We cannot hope to affect the whole of the jute-growing area in a single year, but what we are doing is to grow this seed and then to distribute it or sell it, giving preference to those tracts where cultivators are in the habit of producing seed for sale. The reason why we are attempting to produce seed outside the province of Bengal is that, first of all, a crop of seed is not as valuable as a crop of fibre; I mean to say, taking the ordinary crop of jute as 15 maunds of fibre, that is roughly Rs. 150 an acre. A crop of seed jute in Bengal is very much less than it would be in Bihar. A crop of seed jute in Eastern Bengal would average something like 3 maunds of seed per acre, probably never more than 5 maunds. That at Rs. 8 per maund would be Rs. 40 at the outside.

Q. Do cultivators in Bengal show any signs of being ready to pay high prices for this superior seed?—**A.** Yes, I think so. As a matter of fact we can deliver the seed in these places at prices which are perhaps lower than the average, much lower than the price of seed in some places, and rather higher than in others, but on the whole below the average market price.

Q. Does it pay planters in Bihar to grow jute seed?—**A.** Yes.

Q. How do you enable the seed-growing cultivator in Bengal to get hold of this jute seed?—A. We are just commencing to organise. The Director of Agriculture proposes to work through the panchayats. This year, for next season, we are distributing a certain amount of seed to each panchayat on the condition that the crop is not cut for fibre but that the whole of the produce remains for seed, which will be sown in the next year. The quantity of jute seed distributed to individuals has been adjusted so that, if the above is done, the cultivator to whom seed has been given will, on an average, have sufficient seed to sow the whole of his jute area next year. If entirely successful the scheme will result next year (1918) in about 30,000 acres being sown with improved jute seed in the Dacca district alone. At a moderate estimate this would entail an increased yield of 60,000 maunds of jute fibre.

Q. Is there much cross fertilisation in jute?—A. No; practically none.

Q. Do you get cases of people growing mixtures of local and improved seed?—A. I have not yet had sufficient experience of this phase of the work to say, but it is highly probable. We anticipate it. If the cultivators begin to grow our jute in a seed-producing district the supply of seed from that district must be mixed for the first few years. Ultimately, however, because of its superior qualities, the improved jute will completely replace the local one.

Q. Does the value of your seed depend on its being pure, or is it only a question of greater outturn?—A. At present, it is only a question of greater outturn. There is not a sufficient difference between the quality of the fibre of one kind of jute and another to make the respective prices differ much.

Q. The mixture will be injurious only in arithmetical proportion?—A. Yes.

Q. You do not find, as a matter of practice, that jute is extending into any other of the provinces where it had not been grown largely before? Is the growth materially extending?—A. There is no jute outside Bengal, Bihar and Assam at present. There were certain experiments made in Madras, the Central Provinces and other provinces about ten years ago, but they were not continued for very long.

Q. Practically in areas outside Bengal you have got to get to you nearly sowings by means of irrigation, and if it is a question of storage it is too expensive?—A. Yes, I think so. I am not at all sure that outside Bengal, Bihar and Assam, it would be possible to grow jute. I am inclined to think it could not be done except by irrigation. In a tract like the Punjab colonies, where it is possible to get water in time to sow the crops, it is really a question of a sufficiency of labour and of retting water.

Q. I understand that jute in some places is followed by a rice crop almost immediately?—A. Yes, that is a very wide practice in Bengal.

Q. Then that can be done especially in Dacca and Mymensingh?—A. Mymensingh very especially; in all tracts which are not too low for it. There are different types of land which grow jute. Some never go under water; others are typical rice lands where they grow a crop of jute or *Aus* paddy first.

Q. The extension of jute in some areas would not diminish the outturn of food crops?—A. It should not interfere with transplanted paddy in a district like Mymensingh, but it would certainly extend at the expense of (broad cast) paddy, which would be replaced either on high lands or where it is grown in rotation with transplanted paddy.

Q. The jute crop is usually a heavier crop than the rice crop?—A. Yes, but there is one point about that. Take the case of a single cultivator. It is possible he grows more jute than he should. The extraction of the jute fibre comes just at the same time as he would be transplanting his paddy and if he has too much jute to extract, he has to restrict the amount of paddy. That is rather indicated by the statistics.

Q. You speak of Hibiscus as fulfilling much the same purpose as jute?—A. Yes.

Q. Of course it is grown no doubt in small quantities in many parts of India; but how about the difficulty of retting it?—A. The cultivation of Hibiscus would have to take place where retting water is available; but this is the case in many places when the rainfall, either in amount or its distribution, is unsuitable for jute. For instance, starting with Western Bihar and the eastern part of the United Provinces; perhaps also in some parts of the Central Provinces: in the rains there would be a considerable amount of water in these tracts, but the rain would not come early enough to allow of the sowing of jute.

Q. What time would the Hibiscus be required to be retted?—A. In August and September. The reason why one would grow Hibiscus instead of jute in the tracts just mentioned would be that Hibiscus would be sown so much later. It is necessary to sow jute earlier than the Hibiscus to get a normal crop.

Q. Taking the case of wild plants with fibre-producing potentialities, which are under cultivation; suppose you got hold of a variety of them; don't you think that it is rather risky taking a wild plant and growing it under cultivation?—A. I don't think so. I think one of the varieties of jute is supposed to be a native of India.

Q. That has probably been evolved after a long course of selection?—A. I have an instance in Sida, a jungle fibre which I have been growing during the last ten years. I do not think it adversely affects other cultivated crops in any way.

Q. When you introduce your Sida on an economic scale, a considerable period will elapse before a market is established for it?—A. For Sida there is an immediate market.

Q. Locally?—**A.** Yes, and it would always sell in England. Probably it would go into finer material than could be made of jute. I have ascertained that there would be no difficulty in disposing of any quantity of *Sida* fibre in any European market.

Q. You would have cases where you would not be able to establish a local market until you produce in pretty considerable quantities?—**A.** Yes, perhaps.

Q. You might want some organisation for helping the growers of the crop through for a year or two, not only for fibre but for other things?—**A.** I don't think there would be the same difficulty in the case of a fibre like *Sida*.

Q. You don't think an organisation to purchase these things and get a market for them, for the first year or two, necessary?—**A.** In the Central Provinces, I think, you would need organisation for the disposal of large quantities of fibres of the jute class.

Q. Commercial agency or the Agricultural Department would have to give facilities? The Agricultural Department has done that kind of thing in the past, but it is not an Agricultural Department job. It entails a great deal of work of a commercial nature to men who are really experts?—**A.** Yes, that is true. The Agricultural Department could not hope to carry such a scheme beyond the experimental stage.

Q. When you take up a question like retting machinery, where do you think the functions of the fibre expert should end, and the functions of the industrial expert should begin?—**A.** I have not thought about it very much, but I should think the functions of a fibre expert employed by Government would probably end when the experimental stage is passed.

Q. You were talking of jute substitutes; do you think that paper pulp is likely to compete with jute on the point of price?—**A.** I think it all depends on the price of jute.

Q. Unless jute rises very considerably above the limit of the prices prevalent before the War, the cost of wood pulp is not likely to fall very much?—**A.** The tendency of wood pulp would, on the whole, be to go up but the prices of jute also were if anything higher by comparison for four years preceding the War.

Q. If it was not able to compete before the War, it is not likely to compete now?—**A.** I think that before the War these things were all more or less in an experimental stage. Germany and Austria were the two nations who really made serious attempts to produce artificial fibre, but they had hardly got beyond the stage of experiments before the War came on. I cannot be certain of the figures at all, but they say they can produce paper fibre at prices below £20 per ton.

Sir F. H. Stewart.—**Q.** Is cotton in your opinion likely to be a dangerous competitor to jute under any circumstances? Has it been so in America, up to date for instance?—**A.** There has always been a good market for cotton. The price of cotton, per ton, has always been higher than jute. I don't think cotton would be a very likely competitor.

Q. You don't know of any industry in which cotton has been used in America, as a substitute for jute?—**A.** I have heard of its being used for sacking and also for cordage, but I am fairly certain that it is not used on any large scale for the former purpose.

Q. Is there some particular form of sea-weed which might possibly be used as a substitute for jute?—**A.** I have not heard of any successful developments though I have seen optimistic paragraphs in the daily press in regard to the possibilities of marine weeds in this direction. It has been proposed to extract fibre from water Hyacinth (*Eichornia Crassipes*) for the manufacture of gunnies.

Q. Is there any sign of increased cultivation of jute in Assam?—**A.** It is entirely a question of population.

Q. There is nothing particular being done there now?—**A.** Very little increase is taking place in the area of jute. Bengali emigrants go from Mymensingh to Nowgong. In the last five years there have been about a thousand men per year, and they grow jute.

Q. What is being grown there at present on land suitable for jute?—**A.** It is practically all paddy with some sugarcane, but the proportion of land which is capable of cultivation and has not been cultivated approaches 75 per cent. of the whole country.

Sir D. J. Tata.—**Q.** What are the conditions under which jute is grown here? Why can it not be grown in other parts?—**A.** The difference between North-Eastern India and Western India is one of rainfall. It is not only a question of the actual aggregate amount of rainfall, but of distribution.

Q. Why is not jute possible on the Bombay side, as well as here?—**A.** If you take the Konkan, you may have rainfall up to 200 inches, but practically the whole of that rainfall comes between the middle of June and the end of September, and it begins with a tremendous burst that would be impossible for jute. Jute must have a period of comparatively slight rainfall in its early stages. The land which grows paddy in Eastern Bengal is dry land, at the time jute is sown and often remains dry until the end of June. Even when jute is cultivated on land subject to inundation a large proportion of the growth of the crop takes place before the inundation.

Q. Can Hibiscus be grown on the Bombay side?—**A.** It could be grown on high lands which do not go under water.

Q. Does it require irrigation in any way?—**A.** If the rainfall is small, and especially if it is very late I should say 'yes'.

Q. Could you utilise, say, the tail-waters of large hydraulic works for growing this Hibiscus in any way?—A. Yes; if the water were available in the early part of the season.

Q. By the 'early part' you mean the cold weather?—A. From the end of February onwards.

Q. If water is available, you think this Hibiscus could be grown to advantage?—A. On the higher lands. It is a question of manure too, if your land is not good enough.

Q. The rainfall would not affect it? A heavy rainfall at the foot of the ghâts would not in any way harm the crop?—A. I don't think so, if you are able to give the crop a start with irrigation and if the land is not liable to inundation.

Dr. E. Hopkinson.—Q. I want to ask you about flax. Flax, you say, grows well in Northern Bengal, but has it been grown systematically?—A. There is no flax growing industry; flax cultivation in India is only in an experimental stage.

Q. Have any systematic experiments been made?—A. Not in Northern Bengal; in Assam they have produced quite good results. Last year I had quite a good crop of flax in Northern Bengal.

Q. What acreage?—A. Only small. There is no production of flax; it was only an experimental crop.

Q. You say, "it remains to be proved whether there is room in the province for flax as well as jute?"—A. The point in my mind when I wrote that was that if you grow jute and flax the two crops would probably exhaust the soil in the same way. They would not be able to grow the flax oftener than once in 4 or 5 years at least.

Q. Jute is grown once in three years?—A. It depends on the tract; in some parts it grows every year; in Rangpur about two years out of five.

Q. It would not be possible to grow jute and flax in rotation?—A. One might grow jute in one year in the rains, and then have flax as a cold weather crop another year.

Q. I suppose you cannot form any estimate as to whether jute or flax is the more valuable crop?—A. I think jute is very valuable. The yield of flax is so much less than that of jute. Besides, it is necessary to sink considerable capital in machinery to treat flax on a large scale. I don't think you would ever induce the individual cultivator to put up a small machine of his own for the extraction of flax. It would be rather costly, and more than he could afford.

Q. I think retting is done in small quantities at a time?—A. I understand that in recent years attempts have been made in Ireland to establish co-operative organizations for retting and scutching flax. This would be the only way in which such work could be done in India. For the individual cultivator to do it, it would be a question of the machine. He could do it by means of a bamboo hammer and the scutch, or by a knife made out of bamboo, but it is an extraordinarily slow process under those circumstances. That is one of the things which limit production of sann hemp in the Punjab. The process is so slow, and is not worth the time devoted to it.

Q. By 'central retteries' what sort of area have you in mind?—A. In Bihar where they grew flax, and where the chief experiments have been made so far, they had about 100 acres, and they said that they could conveniently deal with even 200 acres.

Q. You don't know anything personally about flax grown in Assam?—A. The original experiments with flax in Assam were initiated by me and I have been in close touch with all subsequent work.

Mr. A. Chatterton.—Q. You say in regard to sisal, "there are quite simple implements capable of producing good fibre, which would always have a ready sale." Can you tell me what these implements are?—A. The implement I was thinking of is a hinged knife.

Q. Have you any experience in extracting fibre?—A. Yes.

Q. Do you think it would be simple to extract sisal hemp on a scale which the small cultivator might try in starting?—A. Yes, if he had two or three plants of sisal hemp.

Q. Have you tried that machine for extracting plantain fibre?—A. Yes; but I don't believe in plantain fibre, not the edible plantain, because it is too weak. Plantain fibre that I have seen was always far too weak, except as a paper-making material.

Q. Do you know, in the case of plantain fibre, whether the strength of the fibre depends very largely on the time when the trees were cut?—A. I should think it would; I have not tried cutting trees at definite stages of their growth, but I think it would. If you cut the tree while the plant was in a young stage, the fibre would be weaker.

Q. Plantain fibre is always condemned, but I have seen a good deal of it manufactured into ropes, and it seemed to be capable of development?—A. In Bengal and Assam we have had hundreds of samples, and have not come across one fit for cordage fibre. Not very long ago samples of plantain fibre came from Burma, which were very favourably reported on in London. Perhaps the Burma conditions were better.

Q. Is it worth while taking up properly, the extraction of plantain fibre on a small scale?—A. It would have to be a cottage industry. I don't think it is the sort of industry that any except the adult male members of a family could carry on, and the question would

be whether their time would not be spent more profitably elsewhere. The content of fibre is only 1½ per cent. of the plantain tree; that would be the average in Bengal. You would have to deal with an enormous amount of the material to get a proper quantity of fibre.

Q. Do you think that plantain fibre might be cultivated as a cottage industry?—*A.* That is entirely a question of the quality of the fibre. I would not advocate it in Bengal, as my experience is entirely against it.

Hon'ble Pandit M. M. Malaviya.—Q. You say that "it is practically certain that the whole of the increased area put under jute in the period 1910-14—roughly 400,000 acres—was at the expense of food grains; but even then there is an area of over a million acres which cannot be accounted for by the statistics available, and which apparently went out of cultivation; in fact it would appear that the increased area put under jute caused a much more than equivalent reduction in the area of food crops"; and then you go on to say that "it is a question how far such a process can go on, and that although increased yields of food crops will be made possible by the work of the Agricultural Department, it would seem that, as far as present conditions are concerned, Bengal will soon reach the limit of economic safety, if it has not already done so, in regard to jute production." Have you any remedy to suggest for this state of things?—*A.* My suggestions were to extend the area on which jute or other fibres, like Hibiscus, are grown. Without doubt you could go into Bihar with jute.

Q. Do you think that by increasing jute cultivation in Bihar, you would induce cultivators in Bengal to give up jute in preference to rice?—*A.* It would be a question of price which would tempt the ryot in Bengal to go beyond safe limits. He is getting a very high price for jute and is attempting to put down more jute than is safe.

Q. But you say that the demand is going to increase, and would that not sufficiently stimulate the cultivator to put down a larger area under jute?—*A.* You will mitigate the difficulty if you extend the area.

Q. You have no other remedy to suggest?—*A.* I have stated in my written evidence that the work of the Agricultural Department will eventually, after a number of years, increase the outturn of jute by something like 25 per cent.; but at the time when this has been achieved, the increased demand promises to be much greater than an increment of 25 per cent. I don't see that there is any other remedy than to bring in new tracts, in India or otherwise, as producers of jute or of similar fibres. On the whole it seems that the years when the prices of jute, or the area under jute, has been greatest, in those years the areas under rice seem to have decreased.

Q. You say that clearly enough, "since the commencement of the War which caused a shrinkage of over 25 per cent. in the area under jute, rice cultivation has shewn a rapid and progressive recovery?"—*A.* It is necessary to take the War into consideration. The War has entailed freightage difficulties; and these may have brought down the price of rice. Since the War began, freight from Burma has enormously increased.

But the fact that the rice that used to go to certain areas has not gone but has been available in India, would not explain the increase of area in rice crop during the last two years.

President.—Q. There has been an increase in the rice crop and there has also been a decrease in the consumption of rice on the part of enemy aliens?—*A.* A large increase in the rice area under such conditions is very significant. The price of rice in India is less now than it was two or three years ago. In 1913 there was a large area under jute, and in that year the area under rice was lower than in the previous seven years. At the commencement of the War the prices of jute went down to a very low level, and the drop came in time to allow the cultivator to put an increased area under rice. In 1915 there was a still larger area of rice and a very large drop in the area under jute.

Q. You say that the "limit of economic safety" has been or will soon be reached in this matter?—*A.* Yes, I think that is the conclusion one would draw from a study of the subject.

Q. But it does not necessarily follow?—*A.* The greatly increased prices in recent years are an indication to start with. Since 1910 we have had a series of years of very high prices for jute, which showed a continuous tendency to advance up to the time of the commencement of the War. The area under jute also rose in this period, but has never reached the area in the forecast of 1907. That is an indication that considering the profits they are making out of jute the cultivators would have gone further if able to, and they would have put a much larger area under jute.

Q. This balance will work naturally, i.e., when the people find that it does not pay to grow jute, they will not grow it. The United Kingdom is a food-importing country, but that is not necessarily bad economically?—*A.* The conditions are rather different; Bengal is not an industrial country and must admittedly be largely self-supporting in the matter of food; yet there have been in recent years one or two instances of considerable shortage following a big slump in prices of jute. In 1907 the conditions in Northern Bengal approached more nearly to famine than they ever did.

Mr. C. E. Low.—Q. That position has been already reached in various parts of the cotton tracts, so that the relative proportion of cotton and food crops fluctuates habitually from year to year, according to the cash value the cultivator gets for his cotton?—*A.* It all depends on

whether you get these periods of considerable shortage due to excess of cultivation of the non-food crops.

Q. The value of cotton exported from the Central Provinces fluctuates between 7 and 11 crores in two successive years; do you consider that unnecessarily unsound economically — A. It is a question of food supply entirely. Granted this, if the cultivation is profitable, it is an absolutely sound proposition. It must be the reverse, on the other hand, if there are periods when the food supply goes short.

WITNESS No. 124.

Mr. A. C. Ghose.

MR. A. C. GHOSE, *Superintendent of Sericulture, Bengal.*

WRITTEN EVIDENCE.

Capital.

Q. 1.—Many a time I tried to induce my countrymen to buy raw silk and sell but none came forward. I proposed to the late Director of Agriculture, Bengal, to lay out Government money but this was not accepted.

If a rich firm can be started by the help of Rajas, and Maharajas with a reliable manager under Government supervision, the poor cultivators may be saved and the Indian industry may thus get an impetus.

The failures of many Indian enterprises are principally the reasons for the apathy of the Indian capitalists.

I know of the silk industry only. The policy of starting silk worm seed-rearing nurseries or farms was started by me in my own quarters and at my own cost as also the experiments in connection with the foreign silk worms. The former has been a success while the latter is still in an experimental stage.

Government is encouraging the silk worm rearers to raise silk worm seed-cocoons through some "selected rearers" according to Pasteur's system under continual Government supervision as is done in the Government silk worm seed rearing nurseries, a method adopted in all the foreign silk countries.

Government assistance.

Q. 4.—Loan of thread-nets and microscopes and, where necessary, free distribution of disinfectants are given. Also a sum of Rs. 250 for the erection of a model silk worm rearing house and a microscope at a cost of about Rs. 60 to those who pass out annually from the sericultural schools at Rajshahi and Berhampur.

Q. 5.—No money grant is necessary, if Government will kindly continue the policy of trying to raise the numbers of "selected rearers" to produce silk worm seed-cocoons as proposed in 1916 by the Director of Agriculture, Bengal, which will cost Government for the supervision and loan of thread-nets, microscopes and some disinfectants.

Loans will be very good and a 3 per cent. loan will be a boon to the silk cultivators of Bengal on the recommendation of the Bengal Sericultural Department.

Whenever necessary Government should purchase indigenous products.

Q. 6.—The present method followed by Government for the control of the Bengal sericultural Department is sufficient.

Q. 7.—The demonstration farms which are directly under Government control as at present, are very good but at the same time the silk cultivators as well, should be encouraged through selected rearers to raise silk worm seed-cocoons a method followed by all the foreign silk producing countries, as proposed by Mr. Blackwood, the late Director of Agriculture, Bengal, and this proposal would be a practical demonstration by the cultivators themselves to others under strict and continual Government supervision.

Q. 8.—The present measures taken by the Government of Bengal is sufficient which will have to be continued permanently.

Q. 9.—I am concerned only with the silk industry since the last 28 years and at present the scheme is hampered owing to want of funds due to war and there is nothing to grudge.

Q. 10.—Not necessary for silk industry.

Q. 11.—No, none to my knowledge.

Q. 12.—The object of the co-operative societies are certainly very good and if they can help the silk worm rearers, the reelers and weavers, undoubtedly they can do much, but up to this time, as far as my knowledge goes, nothing has been done. I have no practical knowledge regarding co-operative societies but I think if Government can advance in a big village Rs. 1,000, the villagers may also be able to contribute the same amount, from which fund loans may be given at a low rate of interest to the poor cultivators, reelers and weavers.

Q. 13.—The existing scheme followed by the sericultural section of the Bengal Agricultural Department is sufficient and I suggest that the scheme be extended fully as funds are available.

Q. 15.—My practical experience goes so far as silk industry is concerned.

The Government aid given to the silk cultivators has already been referred to above.

gricultural aid.

Q. 16.—My personal knowledge and experience of the Bengal silk cultivators benefited by the Bengal Agricultural Department from researches under the Bengal Government, is that the silk worm rearers get successful crops from the nursery seeds reared scientifically in Government farms and sold to them at a reasonable price.

Q. 17.—The system by which Government officers are already helping the silk industry is satisfactory.

Q. 23.—I think the Advisory Council for Research cannot give assistance to the Bengal silk industry.

Qs. 25, 26 and 27.—Surveys are not necessary so far as silk industry is concerned.

Q. 30.—This is a subject which I pointed out to Mr. Blackwood, the late Director of Sales agencies. Agriculture, Bengal, on my return from deputation in 1913 to the Punjab, United Provinces, Bombay and the Central Provinces. In the Punjab and United Provinces about 15 annas of the silk market, while in Bombay and Central Provinces about one-third of the silk market have been monopolised by the Japanese and Chinese silk. This success has been attained by the merchants and agents deputed from those countries.

In the winter of 1913 I personally met a Japanese officer at the Crawford market in Bombay with samples of raw silk and silk pieces, giving addresses of different firms in Japan. I have also learnt from the silk sellers in the Punjab, United Provinces, Bombay, Guzerat and Central Provinces that Japanese and Chinese merchants come to them with samples but none from Bengal. I would therefore suggest suitable facilities be afforded for cheap and extensive advertisements all over the country and the example set by Japanese and Chinese enterprise be followed in this country as well.

Suitable European markets may also be approached by effective advertisement through the deputation of a competent European official.

Q. 31.—Very good. They give an impetus to the silk cultivators and an advertisement Exhibitions. to the purchasers as well. Government encouragement is desirable. The usual help by Government subsidy is sufficient but public help and co-operation is absolutely necessary, especially in accommodating the exhibitors and providing board according to Indian customs in mofussil districts, for want of which, the private exhibitors, I have personally seen, suffer much and so much so that at the next exhibition they would never come again.

Exhibitions should aim merely at bringing the sellers and buyers into contact.

Q. 34.—There should be trade representatives as I have suggested in my answer to Trade represen-
question No. 30, for foreign countries, but for Indian markets an Indian official with special tatives.
knowledge of silk industry will be suitable. Their duties should be to advertise and get purchasers by showing samples of different owners of silk filatures and merchants and samples of silk pieces from the weavers in Bengal, as the Japanese and Chinese Governments are doing.

Q. 35.—Temporary Commissions may also serve.

Q. 36.—Co-operation of representatives of each province will undoubtedly be very good to check the incoming of foreign products.

The representatives of all the provinces may hold meetings annually and thus co-operate with one another as is done regarding other Government administrations.

Q. 37.—Both the publishing of lists and exhibiting articles will certainly enable the Government Indians to know what they cannot do and very likely, it may tempt them to try for the patronage. production of those articles in India.

For Bengal silk industry, I beg to suggest the recruiting of a dyeing expert and if an experimental station can be started to prepare pucca dye from our indigenous products it will be a very great help for the sale of Bengal silk in the foreign countries and the experts of different provinces should meet often for consultation and help each other.

NOTE.—Witness did not give oral evidence.

WITNESS No. 125.

MR. GANAPATRAI KHEMKA, *Honorary Secretary, representing the Marwari Chamber of Mr. Ganapatrai
Commerce, Calcutta. Khemka.*

WRITTEN EVIDENCE.

The Committee of the Marwari Chamber of Commerce feel that there is a great need for Banking facilities. a well organised system of banking, without which the economic progress of this country is never possible. There should be a great bank in every province, and it should receive full support from the Government. Such banks are necessary for giving financial aid to industrial enterprises, for want of which many of them have failed. These banks should advance loans, for industrial undertakings, on security, e.g., of machinery and plants, stocks and shares, etc. Money grants-in-aid and supply of machinery and plant on the hire-purchase system, may be made also in parts of the country where the people are very poor, for development of cottage industries.

Commercial edu-
cation.

The Committee realise also the importance of higher commercial education for industrial development and suggest that steps should be taken by the Government for encouraging higher commercial education and practical training also in actual manufacture.

NOTE.—Witness gave oral evidence in vernacular, of which the following is a summary.

Witness stated that banks should exist in each province for giving financial aid to industrial enterprises, and if they were under the supervision of experts appointed by Government, it would easily inspire confidence and the public will more willingly subscribe to the capital. Marwaries as a class are rich men and are capable of starting such banks themselves, but in witness' opinion such banks would inspire no confidence.

WITNESS No. 126.

Mr. R. P. Adams.

MR. R. P. ADAMS, A.M.I.M.E., Chief Inspector of Factories, Bengal.

WRITTEN EVIDENCE.

Capital.

Q. 1.—I have had no experience in regard to the raising of capital for industrial enterprises but I believe there is no difficulty whatever in raising capital for industries which have already proved a success provided the promotion of new concerns are in the hands of firms of good repute. I understand that Indians generally find it difficult to raise capital on account of the many failures in concerns started solely by Indians. Government should certainly encourage Indians in the development of industries and Local Governments would I think be in the best position to decide to what extent assistance is desirable or necessary.

Q. 3.—The two principal industries in Bengal are jute and coal and, in both these, periods of prosperity are invariably followed by periods of over-production, necessitating short-time employment.

Several large flour mills have been started in Calcutta during the last 5 or 6 years, resulting in a steady over-production and most of these mills have had to work intermittently to curtail outturn.

Government
assistance.

Qs. 5 and 6.—The desirable method of giving Government aid to existing or new industries would depend largely upon the nature of the industry concerned. For example, the existing method under which Government guarantees the dividends on new railway projects appears to be satisfactory but Government would hardly be justified in guaranteeing dividends on new industrial concerns, especially in a case, such as a concern for the manufacture of steel, in which an enormous capital would be required. In such cases Government should, if necessary, be prepared to provide part of the share capital, preferably the ordinary capital, and sell their interests in the concern to the public as soon as the business reached a reasonable dividend paying stage. If the outturn of such a concern is required by Government, as it probably would be in the case of steel, there should be no objection to Government guaranteeing the purchase of a portion of the outturn for a limited period. Government should not assist in the starting of any industrial concern unless there is a reasonable prospect of the products being placed on the market at rates that would compare favourably with the same class of articles imported from England or the allied countries. For such time as Government held shares in a commercial concern they should be represented on the Board of Directors and the accounts of the concern should be subject to Government audit.

Pioneer factories.

Qs. 7 and 8.—I have no experience of Government pioneer factories but I am of opinion that pioneer factories should be initiated wherever it is considered that there is a reasonable prospect of establishing and developing a new industry. When such an industry has been established, the Government pioneer factory should be sold to private capitalists unless it is considered necessary to retain it as a demonstration factory for the benefit and training of Indians.

Several small companies for the manufacture of such articles as pencils, matches, soap, cigarettes, leather, etc., have been started by Indians in Bengal in recent years but in almost all cases the concerns have proved a failure, largely owing to insufficient capital having been obtained at the outset, necessitating borrowing at high rates of interest.

Limits of Govern-
ment assistance.

Q. 13.—There would be no need for Government to aid an industry which had already been successfully established, and Government aid could hardly be considered to interfere with private enterprise in the case of an industry which had not been successfully established.

Demonstration
factories.

Qs. 18 and 19.—There are about 150 oil mills and about 50 rice mills in Calcutta and its suburbs, all owned and managed by Indians. These concerns are inefficiently managed. The machinery, in nearly all cases, is badly laid out, and the cost of maintenance of the driving power is generally very high. Government might, for each of these industries, start a demonstration factory which should be equipped with up-to-date and well laid out machinery, and provided with an economical driving plant. The staff should be allowed to advise Indians in all matters regarding the efficient management of such factories. These industries are seriously handicapped at present for want of expert advice, especially in regard to questions of suitable machinery and repairs. It is, moreover, a notorious fact that, in

Calcutta where fuel is cheaper than in almost any other city in the world, the rates* charged by the Electric Supply Corporation for small power users, are so high that the factories have invariably considered it cheaper to install their own small steam plants. These small installations are, however, far from being economical, and are expensive to maintain.

Q. 38.—The rules relating to the purchase of stores by Government departments should be revised. Government departments should adapt their requirements as far as possible to articles manufactured in India provided there is no marked difference between the prices demanded for locally manufactured articles and the prices at which similar articles can be imported from Europe. As regards articles which have to be imported, either because they cannot be manufactured in India or because the prices demanded are prohibitive, Government departments should be free to purchase their requirements either through local agents or through the India Office. There are serious objections to the present system under which departments are required to indent nearly a year ahead for articles to be supplied during a subsequent year. Under existing circumstances indenting officers cannot accurately gauge their requirements so long ahead and there is a tendency to indent on a liberal scale, which results in extravagance. Moreover, departments, such as the Jail Department, indenting for articles which are intended for meeting anticipated requirements of other Government departments are sometimes unable to dispose of quantities of stores on account of the purchasing departments changing their requirements without sufficient notice. Government patronage.

Qs. 44 and 45.—Jute mills in Bengal have in recent years spent large sums in improving the conditions under which their labour live. The improvement has been effected by the provision of pucca built dwelling houses adjoining the mills and by attention to sanitary arrangements and filtered water supply. This naturally tends towards the retention and the consequent better efficiency of labour. It seems a pity, however, that so much money should be spent in this direction without obtaining expert advice as to the best kind of houses suitable for these requirements and sanitary arrangements best suited to this country. Training of labour.

There is another matter which appears to require attention. In all the more important industries, labour is largely obtained through contractors or through sirdars. If it were possible to break down this system and employ labour direct, it would certainly be beneficial to both employers and the labour. At the present time, especially in textile factories, the labour is almost entirely in the hands of the sirdars and time-keepers, who systematically extort money from the workers and are not only the direct agents in causing strikes but are also responsible for the continuous shifting of labour from one factory to another. Strikes are generally engineered on the introduction of any change in working hours beneficial to the labour but detrimental to the sweating of labour. The shifting of labour from one factory to another is arranged with a view to extortion of money before re-employment. The fact that about 25,000 children are employed in the mills in Bengal and that about 28,000 certificates are granted annually on first employment in each factory bears out the statement that labour is constantly shifting.

Q. 51.—As a general rule only boys who have had a good general education should be selected to be trained for positions of supervisors or skilled managers and before they start to learn the practical work of the industry for which they are intended they should spend one or two years in a technical college. In the case of engineers an apprenticeship of at least five years is essential, after which a man should gain further practical experience as a workman before being elevated to any responsible position. In all industries a thorough practical experience is necessary and should receive greater attention than theoretical knowledge obtainable at a technical school. Training of supervising and technical staff.

Q. 54.—Engineers in charge of prime movers are not required to hold certificates in Bengal but, under the Bengal Steam Boilers and Prime Movers Act, boiler inspectors can revoke or suspend any boiler certificate granted under the Act when they have reason to believe that the boiler or prime mover in respect of which it has been granted is not in charge of a person competent to have charge of it. In provinces where certificates are required for engineers the standard of examination should be uniform and Local Governments should recognise each other's certificates. Mechanical engineers.

Q. 55.—At present no facilities exist in Bengal for providing men with certificates. It ought to be possible for anyone in Bengal to obtain a certificate but I would not make it compulsory. This would enable owners to obtain certificated men if they wished to do so.

In this connection, I wish to add that all regulations regarding the survey of boilers and prime movers throughout India should be uniform.

Q. 108.—As I acted for three years as superintendent of jail manufactures in Bengal, I am in a position to state that complaints regarding competition by jail industries would be unreasonable. The average daily number of trained prisoners employed on industries in all the Bengal jails does not exceed 4,000 and these men are employed on various industries but chiefly in connection with the manufacture of articles required by the Jail Department. There cannot, therefore, be any appreciable interference with private enterprise when such a small number is employed in a province with a population of about fifty million inhabitants. Jail competition.

* See letter No. 17698, dated 12th December 1916, from the Agent and Chief Engineer, Calcutta Electric Supply Corporation, printed at the end of Mr. Adam's oral evidence.

Jail industries should be developed to the fullest extent possible and there should be no restriction against the employment of power driven machinery in jails. It must be remembered that prisoners, in a large number of cases, have no training of any description when first admitted into jails and that, if they are long term men, they usually come out after having received a useful training in some industry and their earning capacity is thereby increased.

It should also be borne in mind that the sale of jail manufactured articles is a source of revenue of the Jail Department and is set off against the expenditure of that department. This is obviously in the interests of the taxpayer and there should consequently be no restrictions regarding the manufacture and sale of such articles.

General.

Q. 110.—I have had occasion to visit most of the tanneries in Bengal during the past year in connection with the question of supply of tanned hides to the Home Government. Enormous quantities of hides are shipped from Calcutta, chiefly to the United States and the Continent, and most of the export trade is in the hands of foreigners.

There are at present only about five tanneries in Bengal, all of which are small and of little importance. There appears to be no doubt that the tanning industry is one which could be very largely and profitably developed. The money that is now spent in the preparation of skins for shipment abroad would, to a great extent, be saved, as such preparation would be unnecessary if the skins were tanned in India and this would, moreover, have the desirable effect of taking the trade out of the hands of foreigners.

In developing this industry it would be necessary to employ a large staff of trained European experts.

I have on various occasions visited the Calcutta Pottery Works and am convinced that this is an industry which admits of development. There is a large demand in India for porcelain insulators for electrical purposes. This demand has hitherto been met by importing these articles but I do not see why there should be any difficulty in manufacturing them in pottery works in India.

Qs. 112 and 113.—The manufacture of paper in India, at present, has to depend almost entirely on raw materials, such as wood pulp, caustic soda, bleaching powder, sulphate of alumina, white clay, etc., which have mostly to be imported from Scandinavia and other parts of the Continent. Paper mills have experienced some difficulty since the outbreak of war in obtaining these materials and high prices are having to be paid. Almost all these raw materials could be manufactured in India. As regards wood pulp, which is required in large quantities, experiments have already been carried out on a small scale by the Titaghur Paper Mills Company and it has been demonstrated that bamboo, which is obtainable in large quantities in India and Burma, can be successfully converted into pulp suitable for the manufacture of paper. The only difficulty seems to have been the capital required to lay down a plant large enough to turn out the raw material in paying quantities.

ORAL EVIDENCE, 9TH DECEMBER 1916.

President.—Q. You say, "The rates charged by the Electric Supply Corporation for small power users are so high that the factories have invariably considered it cheaper to instal their own small steam plants." Will you tell us what rates are charged?—A. A variety of rates are charged according to the quantity of current used. It is generally so much per unit, plus about Rs. 5-8 per month installation charges.

Q. What would be the average rate per unit?—A. That again depends entirely upon the quantity used. If a man has a motor running continuously, it works out fairly cheap. But if, on the other hand, the motor works for only four or five days a week and, say, for only seven or eight hours a day, then the rate would work out to be expensive.

Q. Can you give us an idea of the scale of charges that are made?—A. I cannot tell you. A scale of charges can be obtained from the Electric Supply Corporation.

Q. Can you give us some rough idea as to what is the minimum charge for continuous work?—A. In the case of large consumers it works out to less than half an anna, whereas in the case of small users the rate may vary from two annas to four annas.

Q. And in those circumstances, if it were as much as two annas it would pay an oil mill to install its own steam plant?—A. I think so.

Q. You say, "The rules relating to the purchase of stores by Government departments should be revised." You do not say in what particular they should be revised?—A. I say that a Government department should be allowed to purchase stores either through Indian agencies or through the Director of Stores at home, as may be considered most suitable for the department.

Q. But the rules as at present issued encourage the actual purchase of stores in India?—A. Yes, but not European stores.

Q. You mean that the Government should also purchase European stores imported by private firms?—A. Yes.

Q. In what way will that assist industries in the country?—A. That won't assist industries at all.

Q. We are not here to support a purely commercial trader. We want to know in what way these rules can be revised for the purpose of encouraging the industrial development of the country?—A. It should be possible in some cases for Government departments to adapt their requirements more to articles that are produced in the country than is done at the present time. According to the present rules it is necessary to indent for all European stores through the Director General of Stores.

Q. If they cannot be obtained in this country?—A. If they are not manufactured in this country. But what I say is that they should be obtained either in this country or at home, whether manufactured here or not, according to the convenience of the department.

Q. I do not see what advantage there is to purchase European stores through a firm of importers?—A. The advantage is you can obtain stores immediately instead of waiting many months for them. Further buying locally one can obtain exactly what is required, which is not always the case when stores are purchased through the India Office.

Q. But surely if the India Stores Department is organised properly they should get better terms than any Calcutta importer can get?—A. I believe the majority of the European concerns are prepared to supply stores at the same rate as the India Office.

Q. They would not be able to get contract advantages. They would not be able to make forward contracts and you throw the responsibility as to quality on the purchasing officer instead of on a specially organised Government department of expert buyers? You have not made any case for the revision of Government rules on this matter. The Government rules are perfectly clear that if an article can be obtained in this country up to quality, the country made article should be given distinct preference?—A. Forward contracts may be suitable for large consumers like the military, but here again these contracts can be arranged from India through local agents. In the case of small Government departments there is no advantage at all in forward contracts. Presumably heads of consuming departments are able to judge the quality of the material they require.

Q. Have you read the rules recently?—A. Not very recently.

Q. You say that there is a good deal of shifting of labour from one factory to another, and that consequently the time-keepers and sirdars have obtained profit by the re-engagement of men who have been discharged by one mill and taken on in another. Is it possible for the factories to co-operate as regards the recruiting of labour?—A. It may be possible to do something in that direction but considering the enormous number of people employed it will be extremely difficult.

Q. Would you suggest any Government agency?—A. This is a serious problem.

Q. You can make no proposal for the Government organisation of labour so as to prevent the shifting of labour from one factory to another?—A. At the present time, certificates for children are granted in each factory so that when a child joins a factory a certificate is granted. Instead of that, I thought it might be possible to grant these certificates in each district only, so that a child would have to obtain a certificate at one office in each centre, and it might be possible then to keep in touch with these children. When entering a mill the certificate would be given up to the manager of the mill, and the child should not again be employed in any other factory without producing the same certificate.

Q. But will that not interfere with the liberty of a man to go and join any factory he likes?—A. That is the point.

Q. Your main reason for raising the question is to protect the labourer himself?—A. Yes.

Q. You have not made any proposal to remove this difficulty. You merely complain of the disadvantages of the present practice. You have no remedy for that?—A. No.

Q. You say, "In provinces where certificates are required for engineers the standard of examination should be uniform, and Local Governments should recognise each other's certificates." Is it not advisable that all provinces should require certificates for engineers and men in charge of prime-movers?—A. I do not think so.

Q. Is it desirable in Bengal?—A. I do not think so.

Q. You think the present system in Bengal is better than that which prevails in some of the provinces where they require the men to have a certificate of efficiency?—A. I do not say it is better. In Bengal in the last ten years there were only four accidents causing injuries to nine people for an average of 4,000 boilers working. That seems to me to be very good. I do not think you can improve on that.

Q. If you had certificates of competency would you expect that the boilers would be turned to better account and the machinery live a longer life, apart from the accidents?—A. I do not think so.

Q. You think the present arrangement is quite good enough?—A. Yes. I think there is no case for introducing certificates in Bengal.

Mr. A. Chatterton.—Q. Supposing legislation were introduced, would you distinguish between prime-movers and steam boilers?—A. No.

Q. In Bengal are all the boilers annually inspected and passed by the inspector?—A. The whole of Bengal is not under the Boiler Act at the present time.

Q. You mean that in part of the province the boilers are not subject to any annual inspection?—A. Yes. But proposals have been submitted to Government to bring the whole province under the Act.

Q. How do you account for the very small number of boiler accidents in Bengal?—A. Compared with home, I think the requirements of the Boiler Act is above the home standard.

Q. In the districts where the Act is in force?—A. Yes.

Q. You mean that the specifications which are passed by the boiler inspector are more stringent than they are in England?—A. Yes. What I mean is this that the boiler rules throughout the whole of India are very largely based on the Board of Trade rules. At home they do not require the same conditions as we require out here.

Q. Have you any information regarding the tracts which are not under the Boiler Act?—A. A year or two ago, a boiler exploded in one of the districts and injured about 100 people. That district has since been brought under the Boiler Act.

Q. Are those districts which are not under the Boiler Act less advanced industrially?—A. In the outlying districts there are few boilers. When the Boiler Act was first started, it was limited in its application to Calcutta. It was then extended to Narayanganj and Dacca. The Boiler Department is a self-supporting Department, and extensions have only been made to places where it was possible to carry out the works without incurring financial loss to the department.

Q. Would you recommend in the interests of industrial development that the Boiler Act should be applied throughout the country?—A. I should certainly say so. We have already asked Government to extend the Act to the whole of Bengal.

Q. You have expressed here some opinions regarding the functions of jails in regard to the manufacture of goods. On what principle do you approve of jails setting up machinery and turning themselves into factories?—A. It is because they should take the best possible advantage of the labour that they have got. This will make the department as nearly self-supporting as possible.

Q. Is it not practicable with hand industries which require no expensive plant?—A. Unfortunately there is nothing to pick up in the way of hand industries which will pay. Carpet weavers at present would earn about half an anna a day. That hardly pays.

Q. Is that because the jail rates are too low and compete with the outside manufacture in carpets?—A. It is partly because the jail labourer works for about six or seven hours a day. It takes a tremendously long time to get the jail labourer to make carpets, and he is learning the work most of the time.

Q. Would you approve of the establishment of a jute mill in a central jail?—A. No objection whatever. We already have one in Bengal.

Q. The justification for having these factories inside a jail is that they would train the prisoners and they would be able afterwards to earn an honest livelihood?—A. Yes.

Q. Do you think it is easier to teach prisoners to work machinery than practise handicraft?—A. That is so.

Dr. E. Hopkinson.—Q. If a boiler explosion occurs in Bengal, is there any inquiry?—A. There is always an inquiry by the Boiler Department.

Q. And if the boiler is found to be faulty, or if the explosion is due to the culpable negligence of the owner, is he liable for damage?—A. I believe, if there is culpable negligence, he is liable under the Penal Code. In one case a boiler was working without a certificate and the manager was prosecuted on that account under the Boiler Act. In two cases tubes burst on account of sediment, and in another case a boiler exploded inside an engineering works.

Q. The manager was always fined?—A. Only in one case in which the manager was fined because he worked the boiler without a certificate.

Q. Is it part of your duty as Chief Inspector of Factories, to enquire into the housing condition of the working people?—A. No, but we do so.

Q. It is not definitely your province?—A. No.

Q. You have no powers?—A. No.

Q. You do it if it is within the factory compound?—A. From the sanitary point of view we then have power to deal with it.

Q. As a matter of observation, however, you find conditions improving in this respect?—A. Yes.

Q. Does the half-time system obtain in Bengal?—A. Yes. Children work six hours a day. In the textile factories the coolies work 13½ hours. The children are still called half-time workers though they do not work half the time the mill is running. Half-timers are supposed to be between nine and fourteen years of age.

Q. What time do they work?—A. Six hours a day, for six days, in textile factories, and seven hours in non-textile factories.

Q. It is part of your duty to see that the regulation is carried out?—A. Yes.

Q. Have you had any occasion to suggest to mill managers that the factory children working only half-time should be given education?—A. Yes. I have discussed the question with several managers. The majority seem to be of opinion that it will be very difficult to get them to go to school.

Q. You do not know of any case of a school being set up by a factory?—A. A school was established by a jute mill a few years ago, but the only children attending are the children of clerks and shopkeepers in the immediate neighbourhood. This particular school was actually built by the manager himself.

Q. In no case is the attendance at school compulsory?—A. No.

Sir D. J. Tata.—Q. With regard to the effect of the housing question upon the shifting character of labour, do you think that it would pay the employer of labour to look to the better housing of the employees with a view to settling them?—A. A large number of houses have been built in Bengal in recent years simply to attract labour to textile factories.

Q. And such houses should be, of course, in the immediate vicinity of the factories where the people are working?—A. Yes.

Q. Are the conditions such that the houses can be built in the vicinity of these factories? The factories may be in the thick part of the town, where building sites are not available?—A. Of course, it depends upon what property the mills possess. When a mill has property available it is generally utilised for constructing lines, or houses, for their own employees.

Q. And does that help in settling labour to a great extent?—A. Yes.

Q. Do you think that the Government or the municipalities can help in the matter at all by way of legislation, or otherwise?—A. I think Government could give some advice with regard to the class of houses best suited for the purpose, and also in sanitary matters. At the present time factories spend large sums in this direction. The different mills have their own ideas as to the best class of house required but I think the money could be spent to much better advantage.

Q. By building a better class of houses?—A. Yes, and by obtaining expert advice.

Q. Is it part of your duties to inspect those buildings which have been put outside the factory walls?—A. No. But we do so.

Q. In one place you say that the failure of the various factories is due to insufficient capital but a little later you say that these concerns are inefficiently managed. Which of these conditions operates more for failure?—A. Inefficiency.

Q. Want of capital is really due to inefficiency?—A. If efficient management was assured capital would be forthcoming.

Q. Then this statement that failure is owing to want of sufficient capital is not quite correct?—A. It does not reply all that I mean.

Q. It is practically inefficiency of management that fails to secure capital?—A. Yes.

Q. If there was good management capital could always be secured?—A. Yes.

Hon'ble Sir Fazlulhoy Currimbhoy.—Q. You say that in a certain mill the manager started a school. Did he charge any fees?—A. I am not sure. If a fee was charged it was very nominal.

Q. It charges fees?—A. I am not quite sure about it.

Q. What about these half-timers? Don't they go after work in one mill to another mill?—A. They do in some cases, but this is prevented as far as possible.

Q. But if they have a school and the boys are compelled by the factory people to go to the school, I suppose this will go away, that is, this difficulty of the boys of one factory going to another factory in the afternoon? I think you cannot avoid that whatever inspection you have?—A. That is so. But the great objection to school, after working in the local mills is, that the children in many cases come a long distance to their work, and in other cases children live on one side of the river and work in the mills on the opposite side of the river. If they have to go to school also, it means they are away from their homes twelve hours a day.

Q. They generally stay the whole day out?—A. That is the objection that the mill manager will put forward. I do not think there will be much good in having a school unless the education is made compulsory.

Q. Are those who come to the school Bengali boys?—A. They come from numerous districts outside Lower Bengal with their parents.

Q. Is there any medical aid provided for them?—A. Each mill has got a medical officer.

Q. And they supply medicine free?—A. Yes. In all cases.

Q. Any grain shops? Do they supply grain cheaper during the famine times?—A. No. Some of the mills supply iced water in the hot weather.

Q. No grain shops?—A. There are grain shops near by but in a few cases the mills have actually built these shops.

Q. And provided them with grain at cheaper rates?—A. They simply built the shops and let them to the Marwaries. There are cases in which small grinding mills have been started in the bazaar and the current for running these mills is actually supplied by the mills at very low rates.

Q. They do not give any flour or anything else cheaper?—A. No.

Q. There is no Act to force them to have any medical officer or anybody else attending the mill factory people?—A. No.

Sir F. H. Stewart.—Q. Do you inspect the rice mills in Calcutta?—A. If there are any mills they come within the Factories Act. I have visited a large number of them.

Q. Have you had anything to do with the administration of "Smoke Nuisances Act"?—A. I am a member of the Commission.

Q. If the rates of power are reduced you think that many of these small mills would be in a position financially to avail themselves of electric power?—A. It would cost these people nothing at all if the Electric Supply Corporation not only gave current but supplied motors as well.

Q. With reference to questions 44 and 45, do you know personally or officially that the firms were spending large sums of money but not taking expert advice?—A. I do not know where they can get expert advice.

A. Your own?—A. They are not required to take my advice. Expert advice is advice from men at home, that is, with modern experience.

Q. Do you mean that the firm should go to England to get expert advice to put up houses for their labourers?—A. Expert advice should be provided by Government if not available otherwise. The septic tanks built in Bengal are not up-to-date. The same thing applies to houses. It is not necessary to get men from home to build houses suitable for workmen. In the majority of the houses, not more than 300 cubic feet of air space for head is provided whereas the Factories Act require 500.

Q. With regard to jail industries, do you think it is a fair comparison to compare 4,000 labourers who are organised well and very strictly controlled in the jails with the general population of the provinces amounting to 50 millions? Do you not think that an organisation with very strict control of 4,000 persons will interfere with private enterprise?—A. No. It is to be remembered that those men take sometime to learn any particular trade, and they are not skilled immediately they come to the jail.

Q. *Hon'ble Pandit M. M. Malaviya.*—You speak of the attention which was paid by the factories with regard to the housing of labourers employed by them?—A. Yes.

Q. They look only to the physical comforts and the health of the labourers. Is there any provision in these factories for education or any arrangement for that kind of thing?—A. There is only one mill in Bengal where education is provided.

They have erected a school in their own village. The village is inside the mill property. The number of mill hands employed there is more than 4,000.

Q. Is there full provision, made for children of the school-going age?—A. No. I do not know what number can be accommodated in the school, but I think I am quite correct in saying that the school has never been full since it was started.

You have stated in reply to Dr. Hopkinson that there is no compulsion exercised upon these children to attend school?—A. No.

Q. Do you think it would be well if there was some compulsion?—A. It may be tried as an experiment in a district.

Q. Don't you think that there is some disadvantage in gathering together a large population without providing for their moral welfare?—A. The object of education is to make them more independent, and better able to look after their own interests.

Q. And they would be better workmen too? They would be more efficient workmen for the education that they would receive?—A. I think so.

Q. And that would help to do away with the system of sirdars?—A. Yes.

Q. In addition to what you have mentioned, have you observed any other evils arising from the system of sirdars? What kind of moral influence do they exercise over the persons whom they enlist in the service of the factory?—A. Generally they engineer all the strikes in the mills.

Q. I suppose you have seen many of these sirdars?—A. Yes.

Q. Do you think they are the right type of men to be entrusted with the guiding and controlling of the labourers?—A. I do not know how you could manage without them.

Q. Have you discovered any real reason why the system cannot be done away with?—A. No.

Q. Have you come across factories where the system of sirdars is not prevalent?—A. All the textile factories have the same system.

Q. Apart from these textile factories which employ sirdars, have you visited any other factory which has not got the system of sirdars?—A. That system does not apply to other factories to the same extent. In fact, to a lot of factories, it does not apply at all.

Q. Do they recruit labour?—A. Yes.

Q. They go about and induce the men and women to come and work in the factory?—A. Yes. The sirdar is put in charge of a certain section of machines, and the machines require a certain number of men to keep them working, and the sirdars are expected to find men for

working the machines. He shows about 16 in the books but actually employs about 12 or 13. Labour is plentiful.

Q. In addition to what he has received from the employer do you think that he makes something out of the labourers too?—A. Yes.

Mr. C. E. Low.—Q. The half-time workers work on shift system. Is this a single shift system?—A. We split the shift system.

Q. What do they do in the time between?—A. They play about the compound.

Q. Are they made to do more work by the sirdar?—A. Yes.

Q. Suppose a boy has done six hours in a factory do you think he is capable of receiving any intelligent education in any school after that?—A. I do not think so.

Q. Who are these sirdars? What type of people are they?—A. They are a sort of headmen. Anyone can become a sirdar.

Q. What does the sirdar make every month?—A. Anything from Rs. 30 to Rs. 70.

Q. How many coolies has he got under him?—A. It depends upon the department in which he works. In the spinning department, where a sirdar is in charge of children he generally has 16.

Q. Do you think that any system of compulsory education in the mills might necessitate some adjustment of the hours of work, and do you think it would be opposed by the sirdars?—A. I do not think there is the slightest doubt about it. There would be no difficulty if the factories would combine in order to enforce it, but there is no combination among the factory owners.

Q. You speak of the oil mills and rice mills in Calcutta. Very many of them have sprung up quite recently?—A. A great majority have sprung up in recent years. Those in Tollygunge are very recent.

Q. What sort of advice does the intending proprietor get as regards the supply of his plant and other things?—A. They generally buy their plant from agents in Calcutta who supply that particular class of machinery.

Q. Who shows them how to put down foundations for their engine?—A. This would be done by the agents supplying the machinery.

Q. Do you think it is efficiently done?—A. Yes.

Q. What sort of man does the agent for machinery employ?—A. A good commercial engineer, not a man with any vast experience in the running and laying down of plants of that kind. The plant that is put down is often not the most suitable for the job.

Q. You think some authoritative advisory agency would be welcome to people of that sort?—A. I should think so. I have been asked many times to give advice.

Q. It seems to me to be an extraordinary thing that a place like Calcutta with a large number of agencies for machinery of this type is not able to give efficient advice to the purchasers especially if they purchase new machinery?—A. The machines that are sold in Calcutta are machines that are built by the makers at home to suit the home requirements and the home makers never study Indian requirements.

Q. When the machine is set up is it kept up to the mark?—A. No. Very badly looked after as a rule.

Q. That means the employment of inefficient engineers?—A. Yes.

Q. Does not the owner find difficulty in knowing whether the engineer is efficient in the absence of any certificate?—A. I do not think a certificated man would necessarily be a capable man.

Dr. E. Hopkinson.—Q. Do you consider that a boy who works six hours a day in the mills is incapable of further work?—A. He has done quite enough if he has done six hours in a factory.

Q. He can do no other work in any form?—A. As a matter of fact he does, because he shifts from one mill to another.

Q. That is to his detriment?—A. Yes. He should not be required to work more than six hours.

Sir D. J. Tata.—Q. With regard to shifts do they have only one shift or two, so that when one set of boys work from 6 A.M. till 12 noon, another set comes and works from 12 noon till 6 P. M.?—A. In all the textile factories in Bengal, or in most of them, they have about six shifts for children, covering a working period of 18½ hours.

Q. Each of these shifts of boys has only got six hours to work?—A. Yes.

Q. These six hours are made up by three hours in the morning and three hours later in the day?—A. The morning shift works from 5-30 to 9 A. M. and comes back again from 4 to 7 P. M.

Q. How then can they go to work anywhere else?—A. A shift starts in the morning and there is nothing to prevent them from going to an adjoining mill and working in another shift at another mill. They come in and go about the mill as they like.

Q. Surely you could manage to keep them in the mill. After they work in the morning three hours, are they not kept under some kind of control all this time to work the other three hours later?—A. There is no restriction.

Q. If the A shift works for three hours in the morning can they not be kept in the mill in the school till the time comes for the next turn later in the day?—A. Yes.

Q. About the sanitation of dwelling houses, you say you want expert advice from outside. Is there not the sanitary department of the Government or the municipality available for consultation?—A. Yes. The Sanitary Commissioner and the Sanitary Engineer. It is impossible for them to deal with the whole of Bengal. There are Sanitary Inspectors in addition.

Q. This department is not sufficiently manned?—A. It is inadequately staffed.

Q. With regard to "sirdars," do they themselves work in the mills?—A. Yes. They are in charge of gangs of workers.

Q. And the men under them work in the same department?—A. Yes.

Q. On the Bombay side we call them "jobbers" and they are responsible for finding workmen in their own department; they keep the department up to the full standard and as they are paid by piece work they see that the outturn is kept up. Does the same system prevail here?—A. No. In certain departments of jute mills men are paid by piece work and in other departments on daily wages. It depends upon the class of work.

Q. The "sirdar" is also the head of the department for which he finds the labour?—A. Each department in a mill is so large that there are a number of sirdars in each department. There are head sirdars and under sirdars.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You say the mills here work 13½ hours?—A. Yes.

Q. Under what Act?—A. Under the Factories Act.

Q. Continuous work for 13½ hours?—A. Yes.

Q. About the recess for meals, is that included or separate?—A. They work on a system of shifts which has to be approved of by the Factory Inspector.

Q. And the adult labour works for 13½ hours?—A. No. Adult labour cannot work for 13½ hours, because they have got intervals after every six hours. The majority work much less than 12 hours. The hours worked by adults, as a rule, would be about 9 or 9½ or 10 hours.

Hon'ble Pandit M. M. Malaviya.—Q. Are there any night schools attached to any of these factories?—A. There are night classes in Calcutta which have been run in connection with some engineering firms and the East Indian Railway.

Q. In none of the other factories?—A. No.

No. 17698, dated 12th December 1916.

From—The Agent and Chief Engineer, The Calcutta Electric Supply Corporation, Ltd.
To—The President, Industrial Commission.

We have the honour to bring to your notice a public statement referring to our rates for the supply of energy, that was made before your Commission by Mr. R. P. Adams, Chief Inspector of Factories, Bengal, and to point out that the statement reading "the rates charged by the Electric Supply Corporation for small power users are so high that the factories have invariably considered it cheaper to install their own small steam plants" is incorrect, as the following figures will show.

During the last nine years the average yearly number of motors for small power users that have been connected up to our system amounted to 163 motors, varying in size from ½ H. P. to 300 H. P.

The total number of motors for small and large power users connected to our system at the end of 1915 amounted to 1,762, equivalent to a brake horse power of 12,373.

Special reference was made by Mr. Adams to oil and rice mills. Eight rice and nine oil mills have been connected to our system and the average amount paid by these consumers varies from 1.0 anna to 1.3 annas per unit.

The largest electrically driven rice mill installed in Calcutta gives every satisfaction, the owner, who started an electric drive in a small way at first has now adopted it throughout the whole of his mill.

Every year the demand for electrical energy for driving rice mills increases and the inaccuracy of the statement made by Mr. Adams is extremely misleading. We trust therefore that the above facts may be put before your Commission.

Large power consumers can obtain a rate of ½ anna per unit and we have several consumers whose rate works out below ½ anna per unit. This figure is a lower one, we understand, than can be obtained in Bombay where the supply is generated by water power.

NOTE.—Mr. R. P. Adams in returning the proof of his evidence informed the Commission that on account of urgent war work he is unable to submit at once figures in support of his statement. With reference to the supply of power to eight rice and nine oil mills, he stated

that there are at least 150 of these mills within the area covered by the Electric Supply Corporation. He also suggested the preparation of a statement showing:—

- (a) The name of the industry;
- (b) Kind and amount of power used;
- (c) The cost of maintenance for power used; and
- (d) Whether under Indian or European management.

WITNESS No. 127.

THE HON'BLE DR. NIL RATAN SIRCAR, M. D., Calcutta.

Hon. Dr. Nil
Ratan Sircar,

WRITTEN EVIDENCE.

• The present industrial situation is one which calls for prompt action on the part of both the people and the Government. The question of India appropriating to herself some of the fields of industry covered so far by the industrial enterprise of Germany, as well as, that of utilising the favourable economic condition and the vast resources of raw materials of India for industrial development generally, cannot be satisfactorily solved by unaided private enterprise only. It calls not only for the maximum effort on the part of the people, but also for the closest co-operation between the people and the Government,—involving, wherever necessary, the need of Government organization and finance, as well as opportune legislative action. This should be done with necessary circumspection, and the lines of such co-operation and the precautions in the use of reserve powers of the State in aid of industry should be carefully thought out.

While such is the condition generally, there is in my mind an important distinction regarding industry, particularly on this side of India. There are enterprises started by Indians that are struggling on their way as best as they can. There are also enterprises begun by European initiative and conducted by European organisation in which there does not appear any lack of capital or any general short-comings regarding expert knowledge and management. I am interested primarily in the concerns started and run by Indians, and I shall attempt below to place before the Commission those difficulties which beset them. I also believe that the main object of this Commission is to find scope for the "development of the resources of India" through such struggling industries as are at the present time mostly in need of help and advice.

There is available in Bengal labour sufficient in quantity, cheap and teachable, and capable of being more and more efficient under economic pressure. The overseer and supervisors are also available, as also are, in some industries, even the trained scientific experts who require only business experience and knowledge of local materials and conditions to become competent guides.

The raw materials are also there, lying unutilised or exported unworked to foreign countries; an improvement in mining and agriculture will supply whatever finer staples or improved material may be required for successful competition. Private capital, though insufficient, is not entirely wanting, but is shy and cannot be easily attracted from safe and profitable investments in land towards industrial enterprises without some degree of encouragement. No doubt in Bengal we are somewhat lacking in business ability and instinct, but it is only after many costly failures, much trial and error that a people can expect to have in their midst captains of industry,—*entrepreneurs*,—able to create favourable conditions for commanding success. The crying evil in this as well as in other fields is that the people are without the power of initiative and without the power of joint action and organisation. It, therefore, behoves the Government, in order to focus all these favourable conditions towards industrial progress, to supply the organising power which in such circumstances is even more essential than labour power or power of machinery.

For success in industry it is necessary that there should be simultaneous combinations of certain conditions, *vis.*:

- (1) Sufficient capital with elastic banking for its proper distribution and use where needed.
- (2) Expert technical knowledge.
- (3) Commercial efficiency and knowledge of modern business methods.
- (4) Sufficient staying power and other conditions to enable industrialists to resist external competition.
- (5) Skilled and efficient labour.
- (6) Cheap transport facilities by land and water to meet trade demands.
- (7) Favourable market, internal and foreign, secured through industrial and commercial bureaux and other agencies, as well as through protective tariffs and export bounties and other facilities.

- (8) Location of industries in favourable sites, as regards raw materials, market, labour—supply and subsidiary industry, etc.
- (9) Supply of suitable and up-to-date machinery and raw materials, etc.
- (10) Plentiful supply of raw materials and accessories and chemicals.
- (11) Favourable climate and soil conditions.
- (12) Development amongst the people of group consciousness and of the capacity to act collectively.

Hitherto industries of various kind have, from time to time, been started here, but not always with a due regard to co-ordination of all the necessary factors involved. Technical education has been in some lines provided for, in the absence of capital and labour organisation, and factories have been started in some cases without requisite amount of capital or provision of experts.

Further, conditions of success are getting harder and harder every day; and it is to be apprehended that, after the war, the difficulties arising from foreign competition will become much greater and almost insuperable unless timely steps are taken to prevent them.

Amongst others, we in Bengal, labour under the following disadvantages:—

- (1) Our greatest drawback is the absence of sufficient capital at the right time and place. There is some amount of capital in the possession of upper and middle classes, but it is not easily available on account of the strong inducement offered by safe and profitable investments (direct and indirect) in permanently settled land or real property on the one hand and the want of confidence in our business capacity on the other.
- (2) The next drawback consists in the want of expert technical knowledge in some cases and of the capacity for business organisation in others.
- (3) The absence of cheap and adequate transport facilities by land and water is also crippling some of our industrial concerns.
- (4) Further, our industries are labouring under unaided and helpless competition with tariff-protected, subsidised and already flourishing industries of Japan, Germany and Austro-Hungary, the United States of America and some of the colonies of the British Empire.
- (5) I am not satisfied that everything has been done by the Government to secure for us favourable markets in reference to our raw materials and manufactures. There is no independent Consular service for India, and the Indian merchant—meaning a native of the country—is generally very ill-informed regarding everything outside his inherited routine business. Nor have the Government helped any industry to secure proper markets by encouraging marketing organisations and associations of Indian merchants. They have seen with equanimity, instead of resorting to interference, the destruction of much of the advantages of favourable market by the disastrous incidence of railway rates on raw materials and manufactured goods.

Of all the ways in which the Government can render material help to the growth of new industries in this country and particularly in this province, the most fruitful and far-reaching would be the supply of capital on easy terms on reasonable security. As regards these, it may be noted that there are important industries, for example, dye-stuffs, glass-wares, etc., for which we have most of the important raw materials, but which under the present conditions of competition require larger capital than private individuals here are in a position to invest, and joint-stock companies as yet do not command sufficient credit to raise the money.

There are several ways in which Government may help in this matter. I indicate a few below:—

- (1) Government may start pioneer factories in some of these lines in order to give a practical demonstration,—to enterprising industrialists who may be associated with the management of the industry—of their earning capacity as well as of processes and methods leading to success, and may afterwards cautiously and very gradually make over them to responsible organisations.

If necessary, Government may entrust the capital after the transfer to private parties by way of long term of loans.

If a State department is not conceived to be the best agency for lending out on industrial security, then it must be done through industrial banks lending out on such securities as industrialists can furnish. Such banks must supply the necessary money not only for meeting the requirements for ordinary working—the working capital—and for profit-increasing extensions from time to time but also for financing and purchase of machinery at the start.

It is a matter of common knowledge that in France and in Japan, State banks were originally found with the object, amongst others, of assisting industry and agriculture by supplying capital at a moderate charge to farmers and manufacturers on a reasonable security. For some time in India the project of a central State bank has been in the air; but nothing had been done in this direction as yet. A State bank should be established in India not only with the

object of carrying on currency operations but also of supplying, through industrial and agricultural banks, to the industry and agriculture of the country, necessary capital on reasonable security.

- (2) Government should also provide for the training in the technical institutions in India, as well as abroad, of the requisite number of technical experts for our present and future industries in various lines; and should also impart to our people training in business organisation through commercial colleges, supplemented, wherever possible, by starting pioneer factories in certain selected industries.
- (3) Facilities for transport are necessary in much larger degree than are granted by existing railway administrations. Whatever may be decided regarding the policy of the State working the railways in India, there can be no doubt that the control over freight should be assumed and vigorously exercised by the Government in public interest.

As far as possible, in those provinces where conditions are favourable, water-ways should be opened in order to provide for trade cheap and easy transport.

- (4) It is, however, obvious that no amount of activity by the Government in the direction indicated above will in itself secure progress and success for our nascent industries for a considerable period of time at least, unless they are secured against dumping invasions from old and aggressive industrial rivals. The only effective method of securing reasonable conditions of success for industries growing under numerous disadvantages seems to be protecting them behind tariff walls. The various difficulties regarding protective tariff suggested by advocates of the present laissez-faire system do not do away with the need, under special conditions, of this form of State interference with private enterprise, but only argue the desirability of extreme caution. And the fact that, in any determination of the tariff problem, political considerations are involved would only affect the details of the tariff schedule as it would affect enemy countries, other countries, British Colonies and the United Kingdom. But a measure in the demand of which Indian public opinion is apparently very insistent and unanimous cannot be long put off. It is to be feared that there will be a tendency in the public mind in India to undervalue such active steps for the encouragement of industry/as the Government may take at the close of this inquiry so long as the State has not shown courage to meet this demand.

I may mention that the same opinion is shared by many concerned in British industries, as will appear from the report of the Advisory Committee to the Board of Trade on Commercial Intelligence recently published.

Q.—(a) It is to be hoped that some portion of the large incomes along with unearned Capital increments derived by the land-owning classes from land, under the existing land revenue system, should be invested in industrial concerns, particularly in such industries as would lead to the improvement of land or improving the raw produce from land, thus raising the price of the produce and consequently the rental value of the land. This would expedite the improvement in the condition of the cultivators; and all these measures, and the use of their saving for productive purposes, would in the long run increase greatly the wealth and prosperity of the landed classes themselves.

The Government may easily encourage the due discharge of such legitimate responsibility by the distribution of titles and honours. They may provide such machinery through the Director of Industries or through industrial banks as would tap these savings without putting too severe a strain on either the intelligence or the patriotism of the land-owning classes.

(b) The savings of the middle classes, including those in the Government and private service, and the professional classes may be drawn towards industries by the Government sympathetically co-operating in one or other of the ways mentioned below, which will inevitably create in the public mind the requisite confidence in our industrial concerns.

(c) The savings of the cultivating and the labouring classes in Bengal, except in the jute producing districts, are slender, as the bulk of them are living on the margin of poverty, and even the jute districts are mostly in the grip of grabbing usurers. But such as they are, they can be utilised for industrial purposes by means of co-operative societies, particularly those whose object is production as well as sale and purchase.

(d) But the amount of capital thus available from all these sources may not be enough for some time for developing all our sources in raw materials, labour and natural advantages in the province. For this reason indigenous industries must look to such additional capital as can, without any undue risk, be placed at their disposal by the Government. Further drafts must be made on other provinces of India and on Great Britain. It is gratifying to find that the savings of British enterprises in India are available for new ventures. We may hope that even when the high yielding high speculative profits are covered up—a stage which we may regard as a necessary one—these sources will not dry up.

...at this place part of the answer to the question of Government aid to business is that with credit facilities to provide us with cheap capital

on favourable terms as in the past, we shall be thrown on our own resources in this country. And even after the mobilisation of available capital from the sources indicated above, there will be considerable deficit in order to cope with the needs of industrial progress for a generation or two. In what manner the Government can help is a larger problem of finance; but in my humble opinion, some part at least of the large non-tax revenue, from commercial undertakings which the Government is getting, should be laid aside year by year for helping industry by way of capital. Whether such money should be lent out directly or through industrial banks is a question merely of machinery. But the need of appropriating a part of the sum (the payment of which is not in the nature of a great burden on the people) for this purpose is imperative.

Government assistance.

Q. 5.—(1) I am against money grants-in-aid, except under very special circumstances (e.g., for effecting improvements processes, the benefit of which may be in due course shared by the public). Government action in this direction, however careful they may be, is likely to give rise to much criticism.

(2) Bounties and subsidies are necessary at times in order to provide against dumping and other unwelcome devices by foreigners. Such assistance may also be particularly necessary in developing the export trade, as for instance in the case of Bengal silk, when the industry is struggling under serious difficulties.

(3) Guaranteed dividends for a limited period would be one of the suitable forms of aid to new organisations. Such help by creating public confidence would facilitate the influx of capital. This form of help is particularly necessary in those industries in which a large capital is required and which on account of difficulty of market or such difficulties as the Government alone can solve no private industrialists are likely to venture upon. There may also be cases suitable for this form of assistance in the hand-loom industry and other handicrafts where private agencies would feel diffident to start on account of a general want of confidence in the prospects, though the products are so useful and artistic. In many cases Government will not have to pay anything; but any sum actually drawn from Government should be eventually recovered in easy instalments.

(4) In a province like Bengal, short as well as long time loans of public money to industrial concerns are a necessity. Such loans should be made repayable by instalments. Such loans should be ordinarily negotiated through industrial departments of State banks when started or State aided industrial banks on favourable inspection reports by Government experts.

(5) Machinery should be supplied on the hire-purchase system to cottage industries as well as to factory industries. In the case of cottage industries there should be demonstrations of the use of tools and appliances. In the case of factory industries, such machineries should be purchased only on the report of experts testifying as to their efficiency and up-to-date character as well as their suitability to Indian conditions.

(6) Government should subscribe portions of the share capital in case of new industries whose success, according to expert report, is not doubtful, but which the Government is not prepared to start as pioneers. In such cases there should be Government representatives on the directorate.

(7) Government should guarantee the purchase of product of new industries for a limited period, whenever these industries produce anything required by them in the way of stores in any of their department or in the railways. This will increase the staying power of the industries against competition. The price of the products may either be the market price at the time of purchase or calculated on the cost of production.

Q. 6.—In any case there should not be any Government control apart from inspection and auditing of accounts.

Pioneer factories.

Q. 7.—I would suggest the following industries to be pioneered by the Government in Bengal:—

(1) As key industries—

- (a) Alkali (caustic soda, soda ash, soda crystal).
- (b) Coal distillation and production of some ordinary coal-tar products, such as carbolic acid, creosote, naphthalin, toluene, benzene, aniline and if possible some coal tar dyes.
- (c) Chrome salts.
- (d) Tannin extracts.
- (e) Non-combustible celluloid.

(2) As independent industries—

- (a) Sugar refining (from date palm).
- (b) Glass.

(3) A model mechanical and electrical workshop for making and repairing machinery.

Most of the conditions for developing these industries are favourable in Bengal. But most of them require large capital and highly experienced experts. Private enterprise is not likely to start them soon, unless profit becomes certain. When successful from a

business point of view, they may be gradually and with usual precautions made over to private parties. The most important precaution being, that there should be an intermediate stage at which the management should be joint, when those who aspire to take over the industry may acquire experience by associating themselves with good experts and business managers. The workshop should be a permanent institution, and the others should be handed over to private parties.

Q. 11.—Co-operative credit societies for production as well as sale and purchase would be of enormous help to develop many of the cottage industries. Productive societies would help in joint use of many machines, such as hand-loom, cane pressing machine, ploughing machines, etc., and in distributing them among members at reduced rates or among non-members at reasonable rates. Co-operative societies.

Sale and purchase societies should, where successful, dispense with the services of middlemen, and all their profits, which are occasionally very high, should go direct to the producers themselves. Without such organisations the producers who have no staying power are entirely at the mercy of the middlemen. The Government should take the lead in this matter. In the case of small industries, co-operation seems to be a necessity. There should be Government help and guidance, but the organisations should be mainly popular.

Q. 14.—So far as I know, the splendid industries in Germany, Japan and America have been developed and are still being developed by Government help, direct and indirect (*e.g.*, by bounties, subsidies and tariff-protection). It is impossible for any industry within British India, which happens to be in competition with any of the above, to grow without Government aid. I believe there is a strong body of opinion in Great Britain at present in favour of such help. Limits of Government assistance.

Q.—20. Demonstration factories should be started in Bengal, for demonstrating the use of improved tools and appliances as well as improved methods of production, chiefly in the case of cottage industries like weaving and also agriculture and agricultural industries. Demonstration factories.

Q. 22.—I do not think there is any necessity for research in the United Kingdom. Research abroad.

Q. 25.—Certainly, as for instance economic geological survey, economic botanical survey and analytical survey of soil in reference to crops. Industrial surveys.

Q. 34.—There should be trade representatives for India in foreign countries independent of the British Consular service. Assistance in marketing products.

Q. 37.—Government departments should publish lists of imported articles used by them.

Q. 38.—At present preference is given to Indian products only if they are on a footing of equality with foreign-made articles, whereas it is desirable that Indian products should have preference if they can just satisfy Government requirements and if their purchase does not entail extra expenditure.

Q. 39.—Generally speaking, most Indian industries on this side of India are suffering for want of banking facilities. We have many joint-stock banks besides the Presidency Bank. But the quality and quantity of securities that may be offered by the industries under Indian management—which are usually struggling under various difficulties—do not meet with the approval of the existing banks, particularly as there are a large number of efficiently managed big industries under European management as their customers. Banks that are mainly investing bodies are bound to look to existing conditions from the investor's point of view. But the view-point of the Government must be different. The Governments in progressive countries like America, France and Japan, etc., are in perfect co-operation and sympathy with the industries and have taken the full share of responsibility in the matter of their development: amongst other things, they have organised ample easy banking facilities for their growing industries and trade. It is to be desired that the Government here, in seeking to make the people industrially efficient and prosperous, will organise similar easy facilities for nascent industries by starting central State banks with industrial branches in industrial centres, as well as assisting joint-stock industrial banking corporations. Banking facilities.

As regards joint-stock industrial banks they will not succeed in India unless they have the power to issue bonds guaranteed by the Government or unless some portion of the funds in the State treasury is made available to them for a long period. Such concerns, run either as branches of State banks or as private corporations assisted by the Government, are sure to draw a large portion of the savings of the upper and the middle classes (including the *mahajans* and traders) and thus divert them to industrial enterprises. Such banks should also, it is expected, form proper channels for investment of surplus British capital in India in a larger measure. The expected facilities are (a) long time loans repayable in instalments, (b) cheaper rate of interest and discount, (c) fairer and less stringent valuation of such securities as industries can offer against loans.

I may be permitted to state that the absence of banking facilities is the most serious difficulty in the path of indigenous Bengal industries. It is possible for Government to remove this difficulty.

Q. 41.—In Bengal it is not easy under the existing land revenue system to secure large Land policy plots of land for industries, particularly those that are agricultural, *e.g.*, sugar, tobacco, fibres, etc. Further, industries like cattle-breeding and dairy-farming cannot be developed unless there are large areas of land at the disposal of the concern.

Remedies.—(1) Greater facilities should be provided by legislation for the acquisition or leasing of land for factories and agricultural and other industrial concerns. Government should lease out land to tea and other industries on very favourable terms and without much restriction.

(2) All increments of value of land resulting from the industry of enterprising men, in agriculture as well as in manufacture, should be secured to the industries concerned.

Training of labour.

Q. 45.—The efficiency of all labour depends upon primary general education, which should be made available for every child of school-going age. With regard to labour of all grades, it may be said that primary education in school would give not only literacy but regularity, neatness, and certain amount of mental elasticity,—all of which would react very favourably on the efficiency of labour. At all events, immediate steps should be taken to put every child in an industrial area into a school.

- (1) There should be training of the eye and of the hand (through object-lessons and manual work) for every boy in the primary school.
- (2) Those who will be called upon to help or undertake agriculture or in industries dealing with curing of raw materials, must be trained in field schools and demonstration farms before taking up cultivation.
- (3) Amongst the industries those that are purely handicrafts should have their men trained in lower grade industrial school in every district and also through apprenticeship in workshops or demonstration factories (where there are opportunities for training in the use of modern tools and appliances).
- (4) As regards factories, labourers should be trained by apprenticeship in workshops as well as in the schools which latter seem more important in the case of employes in scientific and chemical industries.
- (5) Secondary education will have to be largely remodelled and fitted to meet the requirements of industrial life.

Training of super-
vision.

Q. 51.—I suggest the starting of technological institutes in some respects on the same lines as that recommended by the Kuchler Committee some years ago. There should be one in Calcutta for the present as far as Bengal is concerned. This institution should be fully equipped for teaching different branches of engineering as well as chemical industries. For this province there is particular need of good provision for training in mechanical and electrical mining, railway, civil and boat-building engineering, leather tanning, some branches of textile industries, dyeing, sugar refining, tea making, soap boiling, ceramics, forestry, paper making, industrial chemistry, agricultural chemistry, botany and bacteriology and cattle farming. But no special stress need be laid on branches of work which will be adopted and added to in the light of experience. The existing Engineering College and the Sabour Agricultural School may be absorbed into it.

Such technological institute should be in close touch on the one hand with the actual industries of the country and on the other hand with the Universities. There should be good laboratories and workshops attached to this institute, but the students who have finished their first acquaintance with their branch may be enabled to complete their training by apprenticeship in the workshops, belonging to the Government dockyards, railways, tramways, electric corporation, port commissioners, the municipality, as well as in factories. On the other hand, those who have shown an aptitude for more advanced work should be allowed facilities to join the Universities or to go abroad. In some cases, some of these advance students may prove able and willing to do research work. To students picked out carefully, the research department of the Universities should open their doors.

The proposed institute should be under the management of a Committee on which the Departments of Education and Commerce and Industry should be represented. There should also be in the Committee some educationists and some members of the science and engineering faculties of the University and some Indian gentlemen who are actively interested in industries.

When agricultural, commercial, and technological faculties are established at the University, the higher departments of the technological institute may be affiliated to them. Such an arrangement will draw a very large number of students and divert education into channels leading towards commercial and industrial development.

Research work.

Q. 71.—Industrial research work cannot be done in this country by private agencies in any large measure because they always want quick results, whereas the benefit of research cannot be had in a day. The only proper institution from which dependable research work can be expected and has emanated in all countries is the University. University work in this country is still not well developed, and much remains to be done by the establishment of the faculties of commerce, agriculture and technology to bring our Universities into line with modern Western Universities. The greatest drawback, however, is with regard to facilities for research. It is refreshing to find that in Calcutta we have now a science college endowed for this object. Very much still remains to be done both with regard to this institution as well as others which must come. The mere establishment of these institutions will not help us, unless they are in close touch with industry and are really able to solve those problems which present difficulties to practical men. Scientific research and technological research have

great mutual bearing. The promotion of pure knowledge leads in the long run to the adaptation of such new knowledge for industrial purposes. But we need at the same time a technological research department at the University so that a persistent inquiry may be kept up in the possibilities of raw materials, bye-products, etc. For all these, a much more sympathetic and liberal attitude on the part of the State towards the effort of the University is required than what has obtained in the past. It is our hope that the University will supply this great need regarding the development of industries.

Further, it is desirable to start here, in addition to commercial schools for the training of assistants in connection with the technological institute, a University college of commerce for training of trade representatives, agents, correspondents, brokers, railway men, bankers, accountants, actuaries, statisticians, etc.

Regarding the organisation of the executive machinery for carrying out such measures for the encouragement of industry as may be decided upon, I have to suggest, in the first instance, that the Department of Industry should be separated from that of Commerce. At present a very large part of the activity of the Member for Commerce and Industry is devoted, and that rightly, to commercial topics. It would be an advantage to have a separate Member in the Viceregal Council in charge of Industry. Official organi- sation.

The provincial machinery is more important because it would be in the provinces where all local problems will have to be studied and facts of industry valued, analysed and shifted. The Imperial Department will help in securing such legislation, financial aid, tariff reform, industrial banks, technical education, etc., which would be of uniform help and value to all provinces. But concrete problems which present difficulties to local industries should be dealt with by the provincial organisation.

In the provinces, in my opinion, there should be a very carefully devised machinery so that the beneficent effects of any measures initiated by the Government can reach the struggling Indian industrialists. There should be a Director of Industries in every province. He should be an able man with clear grasp of business conditions. But the greatest of all qualifications would be that he should have sympathy with the industrial efforts of the people. However able a man he may be, if he comes with the orthodox prejudice that India is fit for agricultural pursuits only and nothing better, and that all this desire for industry is sentimental, he will do no good whatsoever and may cause great bitterness. In order to ensure happy results, it is necessary to make the Director of Industries only an executive official and leave the power of initiative as well as of deliberations in the hands of a Board of Industries. This Board should be constituted in such a way that without being unduly large, it would have on it some of the best elements of technical and business ability in the province. In view of what I have said in paragraph 2 of this written statement, I think even at the risk of sacrificing what is generally regarded as 'efficiency' in official circles there should be a strong Indian majority on the Board, if it is to be hoped that the measures undertaken by the Government should carry confidence of the public and if misinformed criticism of beneficent State action is to be avoided. If two Assistant Directors, also members of the Board, are appointed and if both of them are capable Indians, there would be a further guarantee of the measures of the Government being fully appreciated by the public. There are patent reasons why in Bengal the constitution outlined above is specially necessary, because here we have no strong Indian public opinion so far as matters of commerce and industry are concerned.

There should be provincial bureaus under the Director for supplying information to the public through bulletins.

I am interested in soap-making and chrome tanning. Difficulties have arisen in the General former on account of the scarcity of supply of alkalis and perfumes. It would be a great advantage to us as well as to many other industries if we could command a plentiful supply of caustic soda, but the industry (alkali industry) is not likely to be taken up by private parties for various reasons. It is, therefore, my suggestion that Government should pioneer this industry.

The large quantities of raw hides and skins as well as several kinds of tannin-containing barks and fruits that are available here make this country particularly suited to the tanning industry. There are two modern ways of tanning known as bark-tanning and chrome-tanning. Ordinarily, tanning by bark is a slow process but it can be very much expedited by employing tannin extracts instead of barks. As yet no organised attempt has been made to manufacture such extracts, although there are plenty of raw materials such as *Babul* bark, myrabolams, mangroves, whose extracts would prove most valuable to tanners and would give an impetus to the leather industry. Further, a thorough survey should be made for new tannin-containing barks, fruits and wood in our forests. Attempt should also be made to cultivate such foreign plants, as for instance, Sumach, Divi-divi, and Mimosa as have got a fair chance of thriving in India.

For the purpose of chrome-tanning the most essential things are chrome salts (bichromate of potash or soda, chrome alum) and boric acid, lactic acid and borax. An attempt should be made to manufacture these chemicals locally, particularly the chrome salts, for which ore is available in large quantities in many parts of British India.

But it is not merely in the raw materials for the tanning industry that Bengal is rich. My practical experience has convinced me that the Bengal *chamars* are not only highly

steady, regular and hard working, but intelligent enough to learn the working of complicated machinery very quickly.

We have got amongst us some proficient experts trained not only in India but in Great Britain and the Continent. From the variety of hides and skins available here, various sorts of leather,—from the stiff sole to the soft glove and chamois leather,—may be manufactured in this country. I may mention here that in the case of chrome tanning we require skins and hides of prime quality—preferably from slaughter houses. We have to work under a serious handicap on account of the undue fluctuation in their prices caused by the control of this market being in the hands of foreign buyers.

Chrome tanners in Bengal would be much benefited if something could be done to ensure to them a steady supply of such hides and skins as they require from the various slaughter houses. The situation presents a clear case for restriction, by the State, of exports of hides and skins, particularly of such as are suitable for chrome tannage.

The tanning industry stands in need of another class of chemicals, namely, coal tar dye-stuffs, whose supply has been practically cut since the beginning of the War. Bengal tanners are helping themselves as best as they can with some vegetable dyes. But years of neglect and pressure of competition with coal tar dyes have almost brought about an extinction of the manufacture of vegetable dye-stuffs. The chances of their revival are also very remote. The best thing under the circumstances would be to try to prepare coal tar dyes in India; and until this is accomplished, facilities should be given to import into India such dye-stuffs as are being manufactured by the British Dyes Limited recently started in England. I would also have the attention of the authorities directed to bad flaying and bad curing of hide and skins which deteriorate very much in value under bad handling.

In my opinion the following new industries are likely to be successful in this country :—

Cottage industry :—

Brush making.
Lace making.
Making of hand bags and purses.
Sock knitting.
Wicker work.

Making of wooden and earthenware toys and dolls.
Carboard boxes and cases.
Button making (mother of pearl).
Walking stick making.
Making of handles for sticks, umbrellas, etc.
Ratan and bamboo furniture making.
Making artificial linen flowers.

Factory industry :—

Refining date sugar.
Glass making.
Distillation of wood.
Distillation of coal.
Distillation of coal tar, as obtained from iron and other factories.
Alcohol, from potato, sweet potato and molasses.

Galvanised iron sheet.
Brass and copper sheet making.
Pipe making (iron, brass and copper).

Sheet metal stamping.
Birchromate of potash.
Bleaching powder.
Alum.
Alkalis.
Boric acid.
Borax.
Celluloid—non-combustible.
Enamelled ironwares.
Fish preserving.
Match manufacture.

In conclusion, I should like to point out that so far as Bengal is concerned the desire for new industries and new channels for engaging the energies of the people is not due to any sentimental or patriotic aspirations only. There is a genuine economic pressure rendering the continuance of old prosperous conditions in agriculture impossible for the future. The advantage arising from the adventitious rise in the price of jute may have obscured the fact during the last decade. But steadily the difficulties are growing. The population of Bengal has increased and the available area of cultivable waste (almost six million acres) is shrinking every day. The distress resulting from pressure of population on the available resources is to be seen from the prevailing very high rates of interest and from the actual condition of the poorer and middle class people. The cultivators and their farm-labourers seldom manage to rise above the margin of poverty on account of the grip of the *malikans* and the buying agents upon them. The much-vaunted agricultural prosperity of Bengal does not always bring much money into the pockets of the cultivators and their dependents. There are, in

Bengal, out of a population of about 45 millions, roughly 35 millions. The rest, with the exception of a small part, who are engaged in trade, and profession and Government service, are mostly middle class people in search of work. The acute conditions for the search of livelihood of a large body of middle class people are patent to all. While agriculture no longer offers scope to all the classes of the population of Bengal, the finding of new avenues for them is no longer a dictum suggested by mere sentimental patriotism or the mere benevolence of a paternal Government, but by grim realities of the situation.

ORAL EVIDENCE, 9TH DECEMBER 1916.

President.—*Q.* Your note is very full and I suppose most of us will probably agree with a large part of it and I expect that all of us will admit that the whole of it is stated very clearly. There is only one point that I should like to hear your extended views on and that is with reference to question 71. You say that the only proper institution from which research work can be expected and has emanated in all countries is the University. By that you mean also of course colleges of University rank. It is just possible that in this country the conditions are slightly different and as you know a great deal of research work done in this country has come from institutions that are not universities, namely from the Government scientific departments established for the purpose. Now would it not be better if we concentrated our organising efforts towards developing research work in the University mainly with a view to keep that research work on the side of pure science, not of course neglecting results that are of industrial value. The point that I am trying to get at is this, that it is difficult in the University, either here or anywhere, to carry your research work beyond the stage of scientific work into the stage of industrial application, because that requires experimental work on a large scale and it would require also a knowledge of market conditions of a kind not generally known to the University professor. Consequently would it not be better to develop scientific and technical departments of Government in India with a view to passing beyond the stage of research work in pure science to industrial development? Government departments would then, through their specialists, get into touch with commercial people and by its knowledge of Government rules and regulations would be able to assist and foster the application of results?—*A.* I do not see that it would not be feasible for the Universities to associate themselves with research work. And if the Universities be not reconstructed with this idea they will very soon lose touch with the real life of the people. I do not say that at present the universities are fit to take up such work but they will have to be reconstructed on those lines. I was making a list of the universities in the English speaking world and I find that out of 19 Universities there are only 3 or 4 at present which have nothing to do with commercial or technical education and those are such universities, as the Classical University of Oxford and the University of Dublin. It appears that throughout the world there has developed a desire to associate university training with technical and commercial knowledge.

Q. You would like to see the Universities develop the teaching of technology and commercial subjects and go further and develop research facilities?—*A.* That is one branch of it. The two things are quite inseparable. I would not throw the burden of research on those who are engaged in teaching. Of course the research professor may deliver only a course of lectures as to the results of his discoveries from time to time, but the research workers should be associated with the University. As regards the present institutions, such as the Agricultural Institute at Pusa or the Geological Survey Department or the Botanical Department, who are actually making research work they all should co-operate in the matter of training students as so many departments under the Universities.

Do you mean to say that a department like the Geological Department should be a sub-department under the University?—*A.* The research portion of it should be the training institution for University students.

Q. The whole of it is research?—*A.* It may be looked upon as the University faculty for research in geology.

Q. I do not see why it should be attached in any way to the University except that the officers of the department could lend all help to the University? You do not mean to say that you would put the Geological Department under the control of the University?—*A.* I do not mean exactly control. I mean some connection by which greater co-operation would be possible.

Q. In the case of a department like the Geological Department would it be possible for an officer of the department to be a teacher of the University?—*A.* Yes. In order to make teaching a living thing the University must find as teachers men actually engaged in research work in the Department and students must have the privilege of being trained in contact with such workers.

Q. That is the system that was adopted in my time?—*A.* We are all grateful for the introduction of the system.

Q. The professors of geology were members of the Geological Survey, and not only University students, but those who came from Native States, were trained also under that system in the Geological Survey office.—*A.* You mean to say that you would like that extended to the other scientific departments?—*A.* The students of the Universities should have opportunities of getting research work under the departments in touch with the best workers.

Q. You mean that they should be deputed to the department for making research?—A. Yes.

Q. Then you say as a practical proposal that these scientific departments of the Government of India or of the local Governments should be encouraged to accept students from the Universities for training in research problems; and, conversely, officers of the scientific departments would be expected to take part in the teaching work of the University?—A. Yes and the Universities should also recognise and publish the work of their own students carried out under the guidance of the officers of these departments.

Q. These results would be more appropriately published by the department itself?—A. If the students get that opportunity and privilege so much the better. I am rather a little diffident about that. It would be asking the department too much.

Q. I see no difficulty?—A. As a member of the University I shall be extremely grateful if that could be done. The students would be on quite a peculiar footing. They would be neither officers nor apprentices.

Non-members of the Geological Survey have published papers in the Geological Survey Records. There are no reasons why they should not be published by the department.

Sir F. H. Stewart.—Q. Do you think that at present labour is available in Bengal for industrial purposes?—A. That depends on the industry. There are some industries for which labour is available and there are certain other industries for which labour is not available. When I wrote my note I did not mean that it should be taken as a general proposition.

Q. You think that labour could be found for the smaller industries?—A. That is my idea. I have felt no difficulty in my little concerns.

Q. With reference to your remarks about pioneer factories I gather that your opinion is that Government should be associated with the business management from the outset?—A. What I mean is this. Government should start the factories and have them managed by their own experts and business men.

Q. Whose business men?—A. Government should appoint competent men to manage the business side. The business side as well should be managed by Government officers. Such officers should have business training and should see that the concern becomes successful. Private parties who intend to take up a factory should be associated with the Government management for sometime as otherwise they are sure to fail. The question of association comes in here. When a factory has proved successful, Government may hand it over to private enterprise.

Q. With regard to your remarks against usury is it your idea that side by side with the development of co-operative systems for industrial purposes there should be legislation against usury?—A. I should be the strongest advocate of legislation against usury. I find that many of the cultivators in the mofussil are entirely in the grip of money-lenders. After working hard for a whole year the cultivator finds his debt much increased at the end of the year.

Q. You want then to provide some means by which they can be free from the clutches of the usurers?—A. Yes, at present the co-operative societies can replace the mahajan only to a partial extent and therefore the mahajan will remain a necessity for a long time to come. That is more the reason why Government should suppress usury by all possible means.

Q. You then say that some part at least of the non-tax revenue should be available for commercial undertakings? What do you mean?—A. It is only a suggestion and you may take it for what it is worth. The railway is one, irrigation is another, the post office is a third and the telegraph a fourth. The revenue in these departments come directly or indirectly from commercial sources; and I think a portion of these revenue should be devoted to the development of industries.

Q. You recommend that certain industries might be taken up and you mention glass. Do you think Bengal is suitable for glass manufacture?—A. Yes, I believe Bengal is a suitable place for this industry. Of course there might be small difficulties; but they could be got over.

Q. What about raw material?—A. I once heard in the Bengal Legislative Council that there was no good sand here; but I am now satisfied that there is very good sand suitable for manufacturing glass available in Bengal. Samples were sent to chemists and they pronounced them to be very good.

Q. And about labour?—A. I believe it is possible to organize labour for this purpose in Bengal. Labourers will require some training. This is the case with any kind of industry. But suppose we don't get the proper kind of labourers in this province; we can get them from some other provinces. What does it matter? We need not be self-contained in every matter.

Q. With reference to your suggestion about the organisation of a provincial department of industries, do you mean that the Director should be the servant of the Board?—A. I can illustrate my meaning by an example. The Municipal Commissioner of Bombay is not exactly a servant of the Municipality. I mean the same sort of relation between the Director and the Board.

Q. Would you give the Board executive functions?—A. The Director will be the executive officer of the Board; but I want to throw greater responsibility on the Board. Very often the Board will be a non-entity if it is not given some responsible duties.

Q. About Assistant Directors do you think you could get competent Indians?—A. I can think of competent Indians who can take up the post.

Q. The whole trend of your evidence shows that Bengal is particularly weak in the matter of industries and you want to develop them?—A. My attitude is one of encouragement, and there is another thing which I want to make clear. Here in Bengal we are much more advanced politically than industrially. The Government has to convince the people of their (Government's) good intentions and earnestness in the matter of industrial development. If the people become suspicious about this movement it cannot do any good. They begin to entertain all sorts of feelings of irritation; That has to be provided against.

Q. You have referred to chrome tanning. May I ask you if you have interested yourself personally in the matter?—A. Yes, but I manage it through a competent manager.

Q. You are making a profit?—A. I am making some profit. I shall explain what I mean. In the earlier days it was not a success. Now I am making a profit.

Q. Is it conducted on business lines? Are you having your accounts audited?—A. Yes, there are accountants who keep regular accounts on strict business lines.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Have you had any railway difficulties in regard to your business? Do you think that if the railway freights are properly reduced then trade will advance?—The freight is very heavy so far as my business is concerned. For instance I have a small concern in soaps. There is a very large market in Darjeeling but the freight is prohibitive. We have to add from 25 to 30 per cent. to the value of the ordinary goods.

Q. Have you got any scheme in regard to the industrial bank? Do you think that if the bank is supported by Government then people will subscribe?—A. Yes.

Q. They ought to lend money for long periods?—A. Yes, that is the main object.

Q. You said that some portion of the non-tax revenues should be devoted to industrial undertakings and you instanced the earning of railways. Don't you think that the income earned by railways might be utilised in extending railways and thereby helping the people?—A. If one is to be put against the other that is railway *versus* industries, I think that railways should not outrun industries. Whereas the railways kill the handicrafts they do not bring any advantage to places where there are no industries. Speaking from the industrial point of view railways would be the means and industries would be the end.

Q. The railway earnings are generally from raw material. Don't you think that in place of that if there were something like the excise duty in the case of industries that would be much more justifiable?—A. I should think so. This will certainly be a justifiable source of income. But apart from that railways are constructed out of funds raised from loans and there is a saving of 7 to 8 crores every year from this source and another 9 crores from irrigation. What I mean is that some portion of this amount should be utilised for the development of industries.

Q. We have heard many witnesses say that the banks here do not advance money in the case of good securities, because the concerns are Indian. You in your statement say that the securities are not good securities and therefore the banks do not advance money?—A. I do not say they are not good securities. I believe they appear insufficient to the banks from this point of view.

Q. On account of their being of Indians?—A. The thing is there is a great deal of want of knowledge. The bank authorities do not know the Indian firms and the Indian industries and industrialists. That is the trouble.

Q. Then about the Board of Industries we have a system in Bombay, by which we have some elected members and some nominated by Government and the Chambers of Commerce and the Mill Owners' Association? Do you want a system of that kind?—A. Yes. I would have it partly elected and partly nominated.

Q. You say that facilities should be given to import dyes from the British Dyes, Ltd.?—A. If I want 5 pounds of some brown or black dye-stuff I cannot get it unless I am a shareholder of the concern. It should be sold to tanners within the Empire at least.

Q. Do you think that they should give preference to those who are not shareholders? The shareholders ought to get the stuff first. Don't you think so?—A. There is difficulty in getting shares.

I got some shares a short time ago and you can have some and then you will get preference.

Sir D. J. Tata.—Q. We have had many complaints about railway freights. Nearly every industry complains that it is hampered by heavy railway freights. Now, do you realize that the railway companies have also to pay dividends to their shareholders? Of course the whole thing turns on the question whether the railways should be owned by the State or by companies?—A. I think so. But is it not a fact that in India all the railways are practically State railways?

Q. Only some. Not all.—A. My point is that those that do not belong to Government may be persuaded to deal with industries a little more leniently. I notice that sometimes the rates are unnecessarily enhanced.

Q. The Government of India have fixed maximum and minimum rates and the railway companies can only charge between those limits. You complain that wherever possible they charge the maximum?—A. Very often and certainly not the minimum in most cases. But they should charge the minimum for industries.

Q. Should there be any appeal to anybody?—A. Yes, to the Railway Board and at present it is very difficult to approach them.

Q. Unless there is State management how is this possible?—A. I am strongly for State management of railways as I am for State banks.

Q. What suggestions have you to make in this respect?—A. State interference in case of management by private companies or State management and to have a continuously sitting Railway Board to watch over the working of the railways.

Hon'ble Sir R. N. Mookerjee.—Q. With reference to your suggestions about the remodeling of the University courses, don't you think that they must begin at the bottom and, that is, improve your system of secondary education?—A. I am sorry there is that omission. I am strongly of opinion that the secondary education requires to be remodelled extensively so as to adopt it to the needs of industrial life.

Q. Under what department would you place the Director of Industries?—A. I have suggested that there should be an additional Member for Industries in the Government of India. In Bengal there is a talk of a fourth Member of Council. He might have the portfolio of Industries.

Q. You would recommend to create a fourth Member to take charge of Industries?—A. There is in the air a proposal of the appointment of a fourth Member. I would have a Member for Industries.

Q. You state that you are in favour of Government manufacturing machines? Have you any idea as to what it will cost Government to do this?—A. I do not mean all the machines. Only some ordinary but very useful ones. The cost should not be prohibitive.

Hon'ble Pandit M. M. Malaviya.—Q. You are definitely of opinion that the question of industrial development so far as Indians are concerned cannot be satisfactorily solved without Government aid?—A. Yes.

Q. And you therefore advocate the establishment of a State bank with an industrial side attached to it?—A. For my purposes it is not the State bank that is so much necessary as the industrial side of it. Whether there is a State bank or not I would have an industrial bank.

Q. How would you wish this industrial bank to help industries?—A. It may be either a joint stock industrial concern or it may be a branch of a State concern. The bank should have a staff of business experts as well as industrial experts and manufacturing experts, and on a favourable report from these experts the bank should advance money on loan. These loans should be fairly long time loans and the rate of interest should be fairly low; and the securities demanded should not be unreasonably high in value.

Q. On what security would these industrial banks advance loans to persons engaged in business?—A. On the security of land, if there be land, plant, machinery and stocks (that is raw material and manufactured article).

Q. If the industrial bank is a part of the State bank State help is assured. But suppose that the industrial bank is separated by itself, how would you wish the State to help?—A. (1) By guaranteeing a dividend, say of 5 per cent., and (2) by placing some additional capital in the hands of the bank for industrial purposes. These banks would not take deposits.

Q. You think that the public will then come forward to subscribe?—A. I am very hopeful about that.

Q. What is the advantage that you expect will result from the bank having connection with a State bank?—A. In the first place Government reserves may be used. I mean such portions of the paper currency reserve as may be available for industries; and as a matter of fact it has been recommended by expert opinion that a portion of these reserves ought to be invested in India.

Q. You are aware that at present a portion of the Government reserves is available for business purposes through the Bengal Bank and the Secretary of State in London?—A. 4 crores out of 37 crores may be invested here.

Q. You want merely an extension of the same rule to the industrial bank which you advocate?—A. Yes.

Q. And you think that if it is a part of a State bank the Government treasury will be able to replenish the bank in times of crisis?—A. Yes. The banks should always look for financial help from the Government.

Q. Are you aware of any similar system obtaining in any other country?—A. I think a similar system prevails in Japan and Germany and France also.

Q. You say that these banks should have business experts to advise them. In what way?—A. It is only on the reports of such experts that the bank should advance money.

Q. With regard to educational facilities you are of opinion that there should be provision for the technical training of persons who are to be engaged in industries from the workmen to the manager?—A. Yes, I think there should be provision in this country for all grades of technical training.

Q. You would begin with elementary education being made general and compulsory?—A. Elementary education appears to be an indispensable necessity for industrial development. We should therefore have a system of general compulsory and necessary free elementary education.

Q. You do not think that our workmen can compete with the workmen of other countries, such as England, France or America because in these countries the workmen have had nearly 8 years of compulsory education which must tell considerably in favour of them?—A. I know that there is a difference between a person who has no education and another who has a little education. It is remarkable, on the other hand, how creditably many of our workmen acquit themselves in spite of their illiteracy.

Q. With regard to technological institutes, you think that at least one central institute should be established in each province? Do you think that one for the whole country would suffice?—A. I do not think so. The technological institutes will have to impart training, not only in class rooms but also in business concerns and agricultural fields. There is a limit to the distance. Even in the same province the places concerned will be far apart. But on the whole I think there should be one in each of the Presidency and bigger provinces.

Q. If there is only one for the whole country, then students will not be drawn from the distant provinces?—A. One of the reasons stands on the disadvantages of distance. The next point is that greater interest in technological education may be created by the establishment of technological institutions in the different centres. What we have to do is to divert the present channel of education from literary and law courses towards courses for education in commerce and industry, and for that purpose we must have the technological college in the heart of the University; in the very place where there are the law college and the medical college and other colleges. Further proximity of colleges not only creates interest but maintains and develops it by facilities granted to those that are near.

Q. You don't advocate that students should be sent to England?—A. I am strongly for sending a large number of our best students to foreign countries for industrial and commercial training. But all cannot go to England. And not even many.

Q. You would then send the best of the boys to foreign countries to complete their education?—A. Yes.

Q. Would you send them abroad before they have had some preliminary experience?—A. That would depend on the line. Where there are facilities in India the students should take some preliminary training here before going abroad.

Q. You have spoken of the difficulty of railway freights and you are in favour of State railways?—A. Yes.

Q. You have mentioned that there are two rates—a maximum and a minimum rate. Is it not the case that the rates are fixed for a period of 25 years or more?—A. I don't know exactly.

Q. You think that so far as the freight is concerned the State is in a better position to consider what changes should be introduced and to make those changes than a railway company?—A. Certainly. The railway companies will only look to their own interest and not to that of their customers.

Q. And is there not some justification for that?—A. It is not unnatural. But if Government took it up, they would be able to look at the matter both from the industrial and business point of view; and the business side of railways would be subjected to the industrial interests of the country.

Q. You are strongly in favour of a University college of commerce here?—A. Yes.

Q. You are aware that proposals for such a college are under the consideration of the Calcutta University? Do you think they will satisfy your requirements or do you think that a college of commerce like the one at Bombay is necessary?—A. I have seen the curriculum of the Bombay college and so far as I can gather from the calendar the courses of study appear to be satisfactory. But I am not an expert in that matter. I would have a college of commerce, and as regards the details and the courses of study I would leave that to a body of experts.

Q. Do you think that if you receive from Government financial assistance and other encouragement in the shape of a purchase of goods, that will enable the industries to stand on their own legs or would any further assistance be still needed?—A. It would still be needed.

Q. You don't think that financial assistance from Government and a purchase of goods will afford sufficient protection against foreign competition?—A. That will depend on the industries. Some may stand competition with ordinary help. But there are others that must be protected. Take for example the silk industry. Government experts are constantly working in this connection. They have found out some diseases and also some remedies for them. Labourers are being trained. But even with our best efforts we cannot compete with foreign silk.

Q. You said that secondary education needs remodelling. Do you mean that you will have an industrial side by introducing elementary science and manual work throughout the secondary school course?—A. I should have manual training and practical lessons in forging, filling, chipping, turning, welding. I would also make drawing compulsory.

Q. At what age would you introduce drawing?—A. It should be commenced very early. Almost the time that the child begins to read. That is a question of training the muscles and it should be taken up at a very early stage.

Witness No. 128.

THE HON'BLE MAHARAJA SIR MANINDRA CHANDRA NANDY, of Kaniabazar.

WRITTEN EVIDENCE.

There is a large body of opinion in this country which seems to think that India is not fit for large industries and that conditions of life here lend themselves only to the development of small or cottage industries as in Japan and many other Asiatic countries. It appears to me that this opinion is wholly erroneous and is not based on sufficient or correct data. The wonderful and phenomenal development of the jute industry in Bengal, of cotton in Bombay, of tea in Assam and coffee in the Nilgiris, give the lie direct to the statement that India is not fit for large industries. At the same time, there can be no doubt of the fact that there is wide room in India for the growth and development of such small industries as may go to meet the peculiar requirements of the Indian people without coming into competition with the manufacturing activity of the other portions of the civilised world.

Capital.

Government assistance.

Technical aid.

Financing agencies.

The two most serious difficulties in the way of the success of large industries in Bengal are the want of sufficient funds and the absence of expert knowledge. It is unfortunately true that the zamindars of Bengal do not at present give much attention and thought to industrial questions; and, thanks to the permanent settlement, even the people of the middle classes in Bengal are tempted to invest their savings and income in land rather than in joint-stock or industrial enterprises. I have been connected with various industrial concerns in Bengal for nearly 20 years, and I have no hesitation in stating that I have met with the greatest difficulty in raising capital for industrial enterprises or securing loans to finance them. Joint-stock industries being new in the country and many not having done well, mutual distrust and want of confidence seem to be the prevailing difficulties in Bengal. Under the circumstance, I think the Government ought to come to the rescue of the people by helping nascent and struggling industries with either long-term loans of money on merely nominal interest or some sort of subsidy or bounty or guaranteed interest as exist in case of railways. The Government, I think, should also come forward to give expert guidance, free of all charge, to such industries as stand in need of them. With this view, I should like the Government to encourage the study of applied mechanics and science and establish research laboratories all over the country for the examination of all agricultural, fishing, and mineral resources. I think no provision of research work in the United Kingdom for any special subject is likely to do any good to our industries.

If the Government cannot see its way to grant any sort of direct bounty or subsidy to any Indian industry, I should like the establishment of some central State banks where joint-stock companies may find easy loans on reasonable terms. At present, it is not easy for Indian industrial concerns to get any loans from presidency or other banks, though money may be secured on personal securities. So long as Indian capital, particularly in Bengal, will continue to fight shy of industrial enterprises and loans are difficult to secure from any bank, Government should step into the breach and do its duty to the people in offering ample facilities for the proper organisation and financing of all important and responsible concerns. As for small cottage industries, they may be established and developed with the help of the co-operative banks, which are now spreading so fast all over the country. At present the function of the co-operative banks is confined principally to advances to the agricultural population for the purchase of seed and cattle and to meet emergent agrarian situations, but there can be no doubt that these banks could be made much more popular and useful if their function could be extended to the purpose I have just indicated.

Cottage industries.

In the case of cottage industries, the hire-purchase system should be introduced for the indent of all machinery, tools and appliances. There should also be occasional demonstrations by experts of the use of machinery and appliances in selected localities and also to show improved methods of production. For these purposes, annual industrial exhibitions should be encouraged wherever possible.

Pioneer and demonstration factories.

In this connection, I would like to urge the Government to open in Bengal some pioneer industries and demonstration factories. The glass industry, porcelain, tanning, celluloid, sugar-refining and fruit-preserving might very profitably be pioneered in this province. At a place like Rangpur, a demonstration factory might be started by Government for the curing of tobacco and manufacture of cigars and cigarettes and, at Berhampore, a similar factory for silk would undoubtedly prove to be most useful object-lesson in industrial development. I should also like the Government to carry out an economic survey of all the raw materials available in India for industrial purposes.

Government patronage.

As regards the produce of the large factories and industries, I should very much like Government to purchase as much of them as is possible. I am afraid Government does not yet go whole-heartedly for all indigenous manufactures, though many circulars have been issued from time to time for the purchase by all departments of the State of as much of indigenous goods as are wanted by them.

Technical education.

Next to finding money for the industries and a ready market for their produce, I think the most crying need of our people is expert knowledge. In Bengal, there is a particular dearth of such knowledge; and to remedy it, I would suggest the establishment of a large technological and agricultural college as well as a college of commerce in connection

with the University of Calcutta, besides a large number of industrial and technical schools of second grade placed under the control of a Department of Industries. I am of opinion that the scope of the University of Calcutta might be most usefully extended if an agricultural, an industrial and a commercial faculty could be added to it. The University college of commerce should train young men to equip themselves as trade representatives, bankers, accountants, actuaries, etc.

There is no provincial Board of Industries in Bengal or a Director of Industries either. Both these are badly needed in Bengal. The Board should consist only of business men and the Director must be an expert. The agricultural school and research institute at Sabour (near Bhagalpore) is also capable of much improvement and should be made attractive to higher classes of students. If the school could be raised to the status of a college and affiliated to the University, its degrees would attract large number of students from the upper middle classes.

River transit, the cheapest and the most popular means of carrying goods, is now getting impossible, as many of the waterways are practically silted up and are not navigable for the greater part of the year. The Bhagirathi near Berhampore, the Buriganga and the Dhaleswari in Dacca, the Brahmaputra near Mymensingh, the Bhairab and the Kapotakha in Jessore, and the Nadia rivers need to be opened up for navigation throughout the year. The following railway lines are also badly wanted in Bengal :—

1. Between Dacca and Aircha (opposite Goalundo).
2. Between Mymensingh and Aircha *via* Tangail.
3. Between Natore and Godagari *via* Rajshahi.
4. Between Bhanga and Faridpore.
5. Between Khulna and Barisal.
6. Between Comilla and Daudkandi.
7. Between Kalimpong Road to Kalimpong and Chumbi valley.
8. Between Gauhati and Shillong.
9. Between Rampore Hat *via* Kandi and Poradaha.

ORAL EVIDENCE, 11TH DECEMBER 1916.

Mr. C. E. Low.—Q. Under the head of "Pioneer and demonstration factories" you suggest the establishment of a demonstration factory for the curing of tobacco and the manufacture of cigars and cigarettes at Rangpur. You are no doubt aware that there is a very large and up-to-date tobacco and cigarette factory in Monghyr, which is no doubt far more efficient than anything that Government could start as a demonstration factory. How do you think that a demonstration factory would help you, when the large private factory at Monghyr has not had any effect in inducing people to come forward? Do the Monghyr people allow visitors to look at the working at the factory?—A. I am not aware whether there is any college at Monghyr. In Rangpur a college is to be established very soon, and I hope that the students will take a great interest in all these affairs, and for the students who pass from the college it will be very easy to go and learn the business at Rangpur.

Q. Do you think that the students are the people who are most likely to start a tobacco factory if they saw a demonstration factory working?—A. I did not mean that the students were to start the factories, but if the tobacco factory is placed there, and the school be close to the factory, the students will go and learn the trade.

Hon'ble Pandit M. M. Malaviya.—Q. But the question asked by Mr. Low was, that as there is a good up-to-date tobacco factory in Rangpur, why is it necessary to start another demonstration factory; do not the Monghyr factory people admit students or anybody to their factory?—A. I don't know whether the Monghyr factory people admit students or anybody.

Mr. C. E. Low.—Q. You suggest a Board of Industries and a Director of Industries in Bengal. You say the Board should consist only of business men. Would their functions be advisory, or would they have authority to overrule the Director of Industries?—A. Advisory only.

Q. Do you think that will meet the popular demand for a more democratic body?—A. Oh, yes.

Q. What do you mean by "business men" what type of men do you contemplate?—A. Business men who understand business.

Q. That is to say, you contemplate the kind of man being one whose advice you yourself would like to take if you were going to start any business?—A. Yes.

Q. Many witnesses have said that, owing to the lack of experts and business advice, many of these swadeshi industries were failures?—A. Yes, because they did not get any help from anybody.

Q. And it is desirable, is it not, to make experts and business advice available?—A. Certainly.

Hon'ble Pandit M. M. Malaviya.—You have found much difficulty in raising capital for industries?—A. Yes, I found great difficulty in raising capital.

Q. Do you think that unless the Government comes forward to help, in some form or other Indian capital will not come forward for investment?—A. Yes, we beg the help of the Government. If they start a bank or give money as a loan on a long term.

Q. In some form or other you want Government assistance and encouragement?—A. Yes.

Q. Without that assistance you think that Indian capitalists will not come forward to invest much in business enterprise?—A. Yes, I think so.

Q. And you also want greater provision for teaching applied science?—A. Oh, yes; that is essentially necessary.

Q. You say that loans are difficult to secure in Bengal from anywhere, and that "it is not easy for Indian industrial concerns to get any loans from presidency or other banks, though money may be secured on personal securities?"—A. Yes.

Q. Have you yourself any knowledge of cases in which such help has been refused?—A. I have a little experience of it, but no direct experience. I tried to get a loan from our Bengal Bank for the Pottery Works, but that was done by my agent, so I am not aware of the particulars.

Q. But it is your impression that there are difficulties in obtaining help from the presidency banks?—A. Yes.

Q. You advocate the establishment of a central State bank?—A. Yes.

Q. Do you mean that that bank should take up business, for instance that part of the Government business which the presidency banks do at present, and do some other business also?—A. Yes, do some other business also; advance money to the industrial factories or concerns or anything else.

Q. Do you think that one central State bank will suffice for both?—A. Certainly not; there will be branches of it.

Q. You mean one central bank in every province?—A. Yes, with branches where necessary.

* President.—Q. Would it not be better if, instead of using the words "every province," you say "a number of industrial banks in suitable areas," because you cannot expect a bank to coincide with exactness in each province, and there are some small provinces that would not maintain a bank under any circumstances. Your object would be served if the bank is formed in suitable areas?—A. Yes, in different parts of India.

Hon'ble Pandit M. M. Malaviya.—Q. You say that there is much dearth of expert knowledge in Bengal, and you suggest the establishment of a large technological and agricultural college; do you mean there should be two institutions, one a technological and the other an agricultural college?—A. Yes.

Q. And also a college of commerce?—A. Yes, because in India there is no such college from which our students can learn commerce and agriculture properly. Of course we have got at Pusa an Agricultural College, but it is in the nature of a school. We want a college where our students will be tempted to get degrees as an encouragement.

Q. What advantage do you expect from it; you want this college to train up men to apply scientific principles to agriculture?—A. Yes.

Q. Do you think many young men will be attracted to such a college?—A. Yes.

Q. Sons of zamindars also?—A. Yes.

Q. Does the school at Sabour attract such students?—A. At first it attracted some of the youths, but when they found later that after passing the examination there they did not get any Government posts I think they have discontinued to go there; but if there be a degree if that Sabour institute be a college, and a degree is conferred on successful students then I hope that there will be great attraction.

Q. What is the reason for it; is it that the degree will indicate a higher standard of knowledge?—A. A higher standard of knowledge.

Q. Then you want the standard of teaching there to be raised?—A. Yes.

President.—Q. Have you any precise knowledge of the standard now adopted at Sabour and the kind of students who go there; the number that go there and the number that there is now? Do you know the number of students attending there now and whether the number has fallen?—A. I have no information.

Q. I thought you said the number had fallen off; that the students had discontinued going there?—A. I heard it; but I don't know the number.

Q. Is it a fact that a few years back Mahomedans and zamindars' sons used to go there but they have ceased to go there, because they found it to be no good?—A. They think that at present the teaching that is imparted there is not sufficiently good. They get lessons in agriculture, about ploughing only, and very little knowledge about sowing the grains, but the students who want to go there wish to learn scientifically everything, and they are not satisfied there.

Q. They are not satisfied with the standard of instruction that is imparted?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. At the beginning or now?—A. Now. At the beginning they had a college, and having no students, it was reduced to a school. Government

ought to consider that at the beginning there are very few boys who wish to go there, but, if the Government waited for some time, the samindars' sons and other students would have gone there.

Hon'ble Pandit M. M. Malaviya.—Q. You suggest that there is a necessity for adding several railway lines in Bengal, and you give a list of 9 such lines. Don't you think that private industrial enterprise is likely to come forward to take up some of these lines?—A. Oh, yes; there is every probability of private enterprise, but Europeans and not Indians will come forward.

Q. But there are some Indian firms who have taken up some of the branch lines in Bengal?—A. Yes.

Q. You don't expect that the number of such undertakings will increase in the future?—A. No.

President.—Q. What Indian firms have taken up branch line in Bengal?—A. I am not aware of those things; but there is the Tarkessur Railway, and the Martins have taken up making lines.

Hon'ble Sir R. N. Mookerjee.—Q. Indian firms only one or two, and European firms several?—A. Yes.

President.—Q. Is that not a fairly good test; if we have a railway project with guaranteed terms, that Government will patronise and assist and guarantee, and yet Indian firms will not go in and undertake the work, is that not discouraging?—A. I think if they get Government guarantees Indians may venture.

Q. But in the case of railways, we have very good examples of Government assistance, patronage and guarantee. You want the same system extended to ordinary industries. If people will not go into indigenous enterprises, where there is 6 per cent. return, is there any hope of their going into other industries, even if the Government should guarantee. Does this not produce a feeling of discouragement in your mind?—A. I cannot tell you exactly, because the capital is wanted everywhere, and in the railway line we have to spend more money, and so at the beginning they find the difficulty of capital, so I don't think that an Indian company will venture to undertake railway lines.

Q. Why not? If it is worth an European firm going into it, it ought to be worth an Indian firm going into it also?—A. On account of want of experience.

Q. I would like to get this point down; if want of experience is the real cause, won't the same lack of experience discourage Indians from going into industries, even if Government gave the same guarantee as that given to the railways?—A. Yes, that is so.

Q. Is it because they are afraid of failure, or because they don't get such a heavy return? Railways are very good illustrations. European firms go into railways and are willing to undertake railway projects with Government guarantee?—A. I think it is for want of capital and want of experience. These are the two things as far as I know.

Hon'ble Pandit M. M. Malaviya.—Q. You mean want of banking facilities and want of expert knowledge; these are the two causes?—A. Yes.

President.—Q. I should like to know whether this is not a fair question to be considered. We have railway projects that are available. They are under certain terms of Government guarantee. There is a case in which the investment is as safe as anything that could be made by Government, we are being asked by several witnesses to propose to Government that a similar system should be adopted for ordinary industries. If Indian firms will not go into railways when guaranteed, will they go into industries when guaranteed? Is that a fair way of putting the question?—A. *Hon'ble Sir R. N. Mookerjee.*—I should like to discuss it among our own members.

Sir F. H. Stewart.—Q. You give us instances of half a dozen industries, such as glass, porcelain, tanning, celluloid, etc., which you think Government might pioneer profitably in this province. Supposing that Government were to decide that they would do something in the way of pioneering these industries, which of them would you recommend; which would give the most promise?—A. Fruit-preserving, mangoes, especially in Bengal.

President.—Q. Is a similar factory necessary if one is already in existence in Mazaffarpur?—*Sir F. H. Stewart.*—A. He says in this province.

Sir F. H. Stewart.—Q. You have not collected any information about the glass industry?—A. No.

Q. Tanning?—A. I know that. I was connected with a tanning concern.

Q. Is that a recently established concern, or has it been going for some time?—A. No, recently.

Q. Is there any particular assistance you require there from Government?—A. Not from Government.

Q. You speak of a Board of Industries in Bengal, and you told Mr. Low that you think the Board should consist of business men and experts. What do you mean by "experts"?—A. Experts who know business scientifically.

Q. Business experts or scientific experts?—A. I mean scientific experts.

Hon'ble Sir Fazulchay Currimbhoy.—Q. You say, "thanks to the permanent settlement, even the people of the middle classes in Bengal are tempted to invest their savings and income

in land rather than in joint-stock or industrial enterprises. Do you think if Government guarantees interest or anything that zamindars will invest their money? A. Yes, no doubt.

Q. Have they invested their money in the enterprises that failed; did they put their money in largely?—A. Not largely.

Q. Excepting you, did anybody put their money?—A. Yes, one or two zamindars. They have failed and do not want to put any more money.

Q. If there was a Government guarantee or help, do you think the money will come?—A. Yes, but at the same time we want experts.

Q. Do you think that if an industrial bank is started, zamindars will subscribe capital for big industrial bank?—A. Yes.

Q. At what rate?—A. 4 or 5 per cent.

Q. About this expert advice, you say "free of all charge." Supposing you want an expert for a factory for two or three years, do you think Government should give you the loan of this man without salary for two or three years; or do you refer to advice only?—A. Advice.

Q. If you are going to have the man for two or three years, what then?—A. Not for two or three years.

Q. But supposing you wanted him?—A. At that time we must pay him; at the beginning we must have the help without remuneration or salary.

Sir D. J. Tata.—Q. You state here that "it is unfortunately true that the zamindars of Bengal do not at present give much attention and thought to industrial questions." You also say that due to the permanent settlement, even the middle class people don't invest in industries. Do you urge this simply as a sort of excuse why people in Bengal do not invest money in industries, or do you urge it as a grievance?—A. That is a grievance.

Q. Then how would you remove this grievance; by doing away with the permanent settlement?—A. No, I do not mean that. I meant that if the zamindars who have permanent interests in land, find that they can earn or get money in any other way, they will come forward to invest their money.

* Q. It is true, but nearly every witness who has spoken to us about want of capital coming forward urges this as a reason; the permanent settlement makes everybody too contented. Which do you think is better, investment in land or the development of industries?—A. The development of industries, because there are very few zamindars in Bengal. The inhabitants of Bengal consist of about 10 per cent. of zamindars and 90 per cent. of the middle and lower classes, so we ought to consider that industry and commerce are the two main things.

Q. Then the remedy is to do away with the permanent settlement so that the people may then invest in industries?—A. I don't think so. There is no necessity for doing away with the permanent settlement.

Q. But you cannot eat your cake and have it at the same time; then you must be contented with things as they are?—A. The zamindars are contented but not other people, the middle and poorer classes. The inhabitants of Bengal constitute about 90 per cent. of the poor and middle classes whereas only 10 per cent. are zamindars, and they may be contented with their permanent settlement, but the remaining 90 per cent. are not contented.

Q. But you say that even the middle classes invest in land?—A. They wish to have land. If they save any money they don't like to invest their money in industries or anything but they think that if they invest their money by purchasing land they are contented.

Q. The point is this. From time immemorial, the land-owner, the professional man, or the Government servant, was considered a higher individual than either the mere industrialist or worker, and here on this side everybody wants to be a land-owner or a Government servant or a lawyer or doctor, or something of that sort, because in Bengal you generally despise industries as being degrading; is that not the point?—A. That is not the point. We do not despise industries, but we do not know the ways of industries, so we are rather diffident and do not like to go into industries. That is the reason. We are not contented. Of course the zamindars are contented with their landed property and permanent settlement, but the people at large are not contented; they are suffering everywhere.

Mr. A. Chatterton.—Q. You say that you have been connected with various industrial concerns in Bengal for nearly 20 years; would you mind telling us what these concerns were?—A. The Bengal Luxmi Cotton Mills, Tannery and Pottery Works, Stone-ballast works, Ice Factory, and several other things.

Q. Taking the tannery which has been recently started as an example of these enterprises is it a limited liability company?—A. Lately; at first I started it and then made it a limited company.

Q. How about the expert assistance that you wanted?—A. The Mysore Tannery has been appointed as managing agents, and they have their own experts.

Q. You mean the manager of the Mysore Tannery is the manager of your tannery in Berhampore?—A. Yes.

Q. Has that tannery commenced work yet?—A. Yes, it began about 14 years ago.

Q. What sort of leather are you manufacturing there?—A. They manufacture only chrome leather.

Q. What do they do with them?—A. They sell them here and also at home.

Q. They are exporting these hides?—A. Yes.

Q. Is this business developing?—A. At present we daily turn out 100 hides, but hope within two or three months that 400 hides can be turned out in a day.

Q. What are you going to do with these hides; export them?—A. Yes. Of course we must have the market here if it can be sold at any time, but it is generally sold by contract.

Q. In the management of this tannery business, besides the manager from Mysore have you any Bengalis assisting in the management?—A. Yes, I have got one expert whom I sent to America and England and he has learned the business there, and he is now employed in our tannery.

President.—Q. Which does he neglect, if he is the manager of the Mysore as well as the Berhampore Tannery?—A. They heard about the tannery here and enquired about many things. We heard the name of the Mysore Tannery and thought if we could put our business in their hands, it would be a prosperous thing.

Q. I don't see how one man can manage the two of them without making both suffer badly. It is encouraging two failures instead of one success?—A. (No reply from witness).

Mr. A. Chatterton.—Q. You say that you would "like the establishment of some central State banks where joint-stock companies may find easy loans on reasonable terms." What do you mean by that? Do you mean that they should get a loan without adequate security?—A. I mean that if a central industrial bank is established, and a joint-stock company, or any private gentleman wishes to establish any industry, they can get a loan from that bank and they will meet their urgent necessities and everything.

Q. Do you expect to get the loan without security?—A. Without security; when the joint-stock company was well started with some capital of their own, and when they have established their business at that time if they are in need of any money they can give the security of their own property and take an advance from the bank to meet their necessities.

Q. Did the Bank of Bengal refuse to finance this tannery which you are running?—A. As far as my information goes, the bank is doing nothing here. They practically decline to advance money to any of the native firms.

Q. How are you financing this tannery at Berhampore?—A. Most of the capital belongs to me and I have secured two gentlemen.

Q. Are you getting advances from the bank?—A. No.

Q. Where do you get your advances from?—A. At present from our own capital and if necessary we advance the tannery.

Q. You said just now that you were going to expand your business; turning out 400 hides a day will require a very large amount to finance?—A. At that time I shall be in a position to advance them money. It is very difficult to get any help from any bank there, so when business is increasing it will be better for me to advance the money.

Q. Have you applied in the case of this tannery for help from the banks?—A. No.

WITNESS NO. 129.

Mr. P. L. Roy, Additional Legal Remembrancer, High Court, Calcutta.

Mr. P. L. Roy.

WRITTEN EVIDENCE.

I think, generally speaking, that the failure of joint-stock enterprises in Bengal is due to the following causes:—

- (1) The facilities that exist for lending out money at high rates of interest on tolerably good securities;
- (2) The want of proper training and commercial education; and
- (3) The distrust caused by the failure and non-success of several enterprises which have been started on joint-stock basis.

In my judgment, there is little chance of any purely Indian joint-stock concern succeeding without Government aid and a certain measure of Government control. I think money will be forthcoming if a big industrial bank were to be started by Government for the purpose of assisting local enterprises in which Indians of known ability and experience should be associated.

I think the Government should start model dairies in all the towns of Bengal where there is a municipality, and these might in time be leased out to Indians under proper safeguards.

In regard to cottage industries, the Government should establish central depôts, where such articles may be collected for the purpose of sale, and the cottagers should be financed by means of co-operative banks under Government control.

Note.—Witness gave confidential oral evidence.

WITNESS No. 130.

Mr. T. W. TUTWILER, *General Manager, The Tata Iron and Steel Company, Limited, Sakchi.*

WRITTEN EVIDENCE.

Training of labour
and supervision.

I have been in India for the past 5 years in the employ of the Tata Iron and Steel Company, and the greater portion of this time has been taken up in supervising the training and teaching of Indian workmen. My opinion is that the main things to be done to improve the Indian workmen's efficiency and skill can be summed up in a few words :—

- (1) Pay them sufficient wages to enable them to provide nourishing food.
- (2) See that they are well housed and that their living quarters are sanitary.
- (3) See that the men who are brought out from foreign countries to train the unskilled workmen are thoroughly competent to guide the unskilled men.
- (4) Provide sufficient innocent amusements for the workmen.
- (5) When any workman shows an aptitude for any special subject, give him every facility for developing it.

Most of the work for which we have had to train the Indians was entirely new to them, as this was the first industry of this kind of any magnitude in India.

I enclose a statement* showing, year by year, since the beginning of this plant, the number of covenanted and local men employed in each of our operating departments together with the total yearly wages paid and the tonnage produced. From this statement you can see to what extent we have been able to substitute Indians for Europeans and at the same time increase our production.

One of the effects of the Tata Iron and Steel Works has been to afford a source of continuous employment all the year round to a great many people, our total number of employes, including our mining camps, being fifteen to sixteen thousand, the majority of whom before our works started mainly followed agricultural pursuits which entailed intermittent and uncertain occupation the reward of which depended very much on the vagaries of the monsoon.

Efforts are being made at Sakchi to educate the workmen, and in this the Steel Company has been helped a great deal by the Local Government. We are about to start a technical school of a very elementary nature the purpose of which will be to teach our mechanical, electrical and other employes to read blue-prints, to draw, and so forth, so that they may become more proficient in their work. We also have a free night school where our boys and others employed in our works during the day are taught to speak, read, and write English, to count, and so forth, as we consider that one of the greatest handicaps an Indian workman has is that the majority of European foremen brought out do not speak Hindustani, and it is very difficult for either foremen or workmen to make themselves understood.

Our employes come from all parts of India, and I do not think it could be said that any particular race in India is superior to another. The experience here has been the same as everywhere else. When starting up a new plant, you get lots of good men and lots of bad men; the good men stay with you and become efficient, the bad ones find the work too hard and leave. My opinion of the Indian workmen taken as a whole is that they are very intelligent and quick to learn, and they generally shape well when they are trained properly. As an illustration, we will take the bar mill department. Originally, 9 Europeans were employed, and at this particular time the output of the mills was about 400 tons per month. Originally this department had one 16" and one 10" mill. Since that time we have extended this department by the addition of another 10" mill and worked double shifts, that is, 18 hours instead of 9 as was done when the mill was producing 400 tons monthly. Our average production at present in this department is 2,200 tons monthly, and we employ only 2 Europeans. So you will see from this that Indians, given every facility and encouragement, just as industriously apply themselves to this particular kind of work as Europeans, possibly more so during the hot weather, as the tropical conditions are less irksome to them. And this applies to all departments. In the electrical department, 2 Europeans were formerly employed as you will notice from the enclosed statement, and their positions are now being filled by Indians. In the laboratory we originally had 5 Europeans; these have been reduced to 2, Indians having been put in their places. I would like to add that in both these departments Indians engaged in the place of Europeans have had experience and training in foreign countries. I doubt very much if without their having had this experience they would have been able to hold their present positions.

In my opinion, in the iron and steel industry, Indians will be able to replace Europeans up to a certain point, and I will try to make my meaning clear to you by taking each department separately.

Our coke oven plant consists of 180 Coppes non-recovery ovens and 50 Koppers bye-product ovens. I consider that a European Superintendent and one Assistant are all that is necessary to operate this department.

We have two blast furnaces producing at present between 575 and 600 tons daily. 9 Europeans are employed in this department, which I do not think can be reduced until Indians are sent abroad and trained from the bottom up.

Steel works.—In this department, I should say within the next two years for the same number of furnaces that we are now operating, European labour can be reduced very considerably.

Rolling mills.—In this Department, we are reducing the European element considerably, but until the War broke out we bought our rolls from abroad; after the War was declared we were unable to get them from abroad, so had to make them ourselves and consequently had to bring out European roll turners, as this is special work and it will take several years more before Indians can be trained to replace this class of workmen.

I do not think we can get Indians to replace foreigners in the higher positions in the industry with which I am connected until Indians are sent abroad and trained. It seems to me that too much value is attached to the importance of receiving a university education in this country. A good education, I firmly believe, is necessary, but it is not an essential thing that a man has to go to a university to make a good and efficient workman. If an Indian desires to take up an industrial career, instead of continuing his education until he is 22 or 23 years of age and then expecting because he has received that education to commence his industrial career at the top of the tree, he should make up his mind what particular kind of industry he desires to go in for, leave school at about 15 or 16 years of age, and become attached either as an apprentice or workman for a period of years; this period would be invaluable to him for more reasons than one. The period would be invaluable to him for he would get the opportunity of making a skilled and efficient workman equipped with a knowledge of that particular trade or industry which has to furnish him a livelihood, while on the other hand, it gives him an opportunity of discovering whether his selection of an occupation has been wisely or unwisely made. During this time he could with great advantage continue his studies in his leisure time on the theoretical side of the industry, and at the expiration of his apprenticeship (if circumstances permitted) two or three years in a European country would enable him by association with modern and up-to-date practice to attain the same degree of efficiency as the European.

Under the present conditions of Indian labour, although the European element has in our works been greatly reduced, I feel that it will be necessary to have European supervision and direction until such a time as the company picks out youngsters and sends them abroad, making arrangements with some of the foreign firms to take them into their works and make them start at the bottom and go through the school of hard knocks. I suppose you will ask the question why we cannot train Indians here for the higher positions instead of sending them abroad, and my answer to that is this. I will not say Indians cannot be trained here for the higher positions, but in my opinion, if Indians are sent to foreign countries before their habits in life are formed and before they are too old to be influenced by home ties and religious scruples, they will enter upon their work in a freer atmosphere and will see other young men, their equals in social status, beginning at the bottom and working up; and it is my opinion that to become efficient in any department of the iron and steel industry and to be able to teach others it is absolutely necessary that they should go through every stage of the process. I do not think that Indians of the type who would make superintendents or heads of departments would be willing to go through this course of training in this country as they would feel that their social status would be lowered by doing the work of menials which they would have to do if they began at the bottom. When this is done, the iron and steel industry will be more firmly established in this country.

Not only is the question of substitution of Indians in the place of covenanted hands important from the point of view of the stability of this industry, but there are other aspects of this question of the replacement of foreigners by Indians which should not be lost sight of.

First of all is the question of language, which is such a great bar to the foreigner in imparting instructions to his workmen. An Indian in the place of a covenanted hand, knowing their language and the ways of his workmen, should be able to guide and instruct his workmen better than a foreigner who generally does not know and does not care sufficiently to take time to learn the language.

Secondly, an Indian should take more interest in his work, as he should consider that his reputation and livelihood depended upon the results of his work, which is not the case in the majority of covenanted hands brought from European countries. The covenanted European can always obtain employment in his own country, and he also receives certain benefits from his contract: this, I think, has a tendency to make the European more independent, and consequently he is likely to slack.

If an Indian has proper food and nourishment, he should be a steady worker and better able to stand the climate of the country than a foreigner, who usually comes out without his family and misses the wholesome influence of public opinion such as exists in his own country, and is therefore apt to dissipate, which is hardly conducive to his regular attendance.

As a rule, the Indian is more amenable to discipline than the foreigner, who on the strength of his contract or under the impression that he is indispensable to his employers is apt to get a swelled head and to disregard discipline.

Again, the Indian has a permanent interest in the place and the country, and naturally takes more interest in his surroundings and helps to develop the social and intellectual side of his community.

When an Indian is substituted for a foreigner, there is a great saving in salary, as the covenanted hands have to be paid much more than the Indians. Over and above salaries, covenanted men are given free passages to and from their homes, and salaries while travelling; they are also paid very handsome bonuses when they exceed certain tonnages.

I am sure that where Indians have been substituted for Europeans in these works, the quality of our products has not suffered, and you will see from the attached statement that the tonnages have greatly increased. In other words, I consider that our sections have improved, and I make this statement on the strength of what has been told me by prominent members of the Calcutta engineering trade.

Again, it should not be forgotten that the successful demonstration given by this company in the gradual substitution of foreign labour by Indian labour would encourage capitalists to venture into new enterprises from which they are at present held back by the prospect of having to employ costly foreign labour.

As I said before, some of the Indians have obtained very high and very responsible positions in our works that were formerly held by covenanted hands. This should prove an inspiration to young Indians who are looking out for careers to divert their energies along technical lines instead of going in for the overcrowded professions of medicine and law; but I think these young men should be advised to moderate their ambitions and not aspire to become general managers in a couple of months.

You will please understand that the above remarks are made only in regard to the iron and steel industry, as I have had no experience in other industries in this country.

ORAL EVIDENCE, 11TH DECEMBER 1916.

President.—Q. I should like to know if at Sakchi there are any uneducated Indians who are now replacing European artisans? You have mentioned cases of a certain number of educated Indians who have been taken into the works and have successfully replaced Europeans who were previously employed?—A. Many more European and American artisans have been replaced by uneducated Indians than by educated Indians.

Q. And have they replaced any of the European artisans?—A. Yes.

Q. Could you give some idea of the kind of work that they are doing that was formerly done by Europeans?—A. Heaters in the mills, keepers, cinder-snappers, moulders and helpers in the blast furnaces, foremen on the coke ovens, foremen on gas producers, crane drivers, rollers at the blooming and bar mills.

Q. These are uneducated? Yes.—A. I mean by that they may be able to read and write but they had no theoretical knowledge.

Q. No university training and no technological knowledge?—A. No. Except what they have picked up at the works.

Q. What is the highest pay that any of them is getting?—A. Rs. 250.

Q. Take a man of that type.—A. What was he before he came to the works? He was a mechanic.

Q. What was he getting?—A. I think Rs. 1-8-0 or Rs. 2 a day.

Q. That is Rs. 45 to Rs. 60 a month and now he is getting Rs. 250?—A. Yes, plus overtime allowances.

Q. You have one particular man in view. Do you know anything of what he is doing with his money and what sort of effect it has had on his home life?—A. I have seen him with his wife well dressed up. I have seen him at the picture shows. Beyond that I do not know very much.

Q. You say that the men should be paid sufficient wages to enable them to provide nourishing food. We have heard from several witnesses that additional wages are of no value unless the man has some healthy way of spending it. With an increase of wages the man indulges in a little more drink accompanied by staying away from work for one or two days in the week. Do you find that to be the case?—A. I do not.

Q. To what do you attribute the better result at Sakchi?—A. To sanitation, to providing better classes of houses than they have been used to, to providing amusements, such as games, picture shows and so forth with the idea of raising their social status.

Q. Generally you mean that when they get a higher wage they will be tempted to enjoy their wages in a healthy way and that you are getting satisfactory results?—A. I think so.

Mr. C. E. Low.—Q. There has been a good deal heard of a letter published in the *Bombay Chronicle* by an ex-employé of Messrs. Tata. I think his name is Mr. Antia. The general purport of it was that while Messrs. Tata were making professions of giving greater employment to Indians they had no intention of doing so?—A. My written evidence deals with the point. I know Mr. Antia is only a lawyer with two months' experience in the steel business.

Q. Probably he was not a competent person?—A. I do not think the man to my knowledge has ever been round the works at all. How could he judge without seeing the thing fully.

Q. You speak of covenanted men. What do you mean?—A. I mean men imported into India under an agreement.

Q. What is the attendance at your night schools roughly speaking?—A. The average number attending the night school at present is about 70. We have not enough room and teachers for a larger number of boys.

Q. It has often been said that in the case of industries which involve long and hard hours of work like engineering, people are too tired to attend and profit by night schools. Do you find that is the case?—A. I think that would be the case if men were required to work twelve hours. But our men work only eight hours and the majority of the younger boys do not hold responsible positions and do not do much hard work.

Q. If you select a certain number of the more promising boys and train them do you think you will find that it pays you in the end?—A. I think a certain number of the selected boys should be given shorter hours of work and be specially trained.

Q. How long have you had this night school going?—A. About two years and six months.

Q. It is yet too early to judge of the results?—A. Yes.

Q. There is only one steel business in India and unless the man gets the experience in your works he cannot get it outside?—A. The experience a man gets at our plant would not be of much benefit to him in any other kind of work as the machinery and so forth required for the operation of our steel works is very different from that required for any other industry.

Q. That sort of thing cannot go on indefinitely, if you get a suitable technological institute in Calcutta and if you go on training your men higher and higher?—A. Yes.

Q. You say "I will not say that Indians cannot be trained here for the higher positions, but in my opinion if Indians are sent to foreign countries before their habits in life are formed and before they are too old to be influenced by home ties and religious scruples they will enter upon their work in a freer atmosphere and will see other young men, their equals in social status beginning at the bottom and working up." I gather that when your steel works are placed on a somewhat wider basis, as at no distant date it will be, you will be able to give them the atmosphere you speak of?—A. I think so. If we get a dozen men trained in the way I suggest they would come back and be able to train others.

Q. You want men to create an atmosphere in which you could not only run your works but train other people?—A. Yes.

President.—Q. Have you any experience of the men who have been trained in Europe?—A. Yes. With electricians, chemists and in the commercial department.

Q. What salary?—A. Rs. 200 to 300.

Q. Was Mr. Antia a man who had been to Europe?—A. For law.

Hon'ble Pandit M. M. Malaviya.—Q. Don't you think the lack of elementary education is an impediment to industrial efficiency?—A. I think everybody should be able to read and write as a general principle. But to screw a nut or a bolt it does not make much difference.

Q. If in addition to that general education the boys received a little elementary education in science, in physics and chemistry, and in drawing and manual work, do you think they will make better workmen?—A. Yes. That is what we are trying to do. We are starting a little drawing school.

Q. Do you contemplate having a school for the children of workmen for giving them instruction in the three R's?—A. We have a school which we intend to enlarge so as to give elementary education to all boys and girls of a school-going age.

Q. Do the workmen show a desire to avail themselves of the teaching?—A. I am not in a position to say until we get the necessary equipment for our drawing class.

Q. You have stated to what extent Indians have replaced Europeans does that apply not only to the lower grade of men but also to the higher grade men?—A. It applies more to what we call the skilled workman.

Q. And does it apply above that to the foreman class?—A. In some departments, not all.

Q. You are getting Indians to act as foreman in some departments?—A. Yes. But not in the entire charge of a department.

Q. Have you a system of apprenticeship to train some of the workmen to become qualified in course of time to take charge as superintendents. Do you contemplate introducing any such system?—A. No. That is why I suggested sending these men abroad.

Q. Would you select some of the promising men and send them out?—A. That is my idea.

Q. Apart from this idea of sending men to foreign countries, have you in contemplation a system of apprenticeships for training promising workmen to hold higher positions?—A. Yes. Such as foremen and so forth. We are doing that now. But there is no regular system of apprenticeships such as the railways have.

Q. Do you think you can introduce such a system?—A. That is being talked of by the company.

Q. You say that in the steel industry Indians can replace Europeans up to a certain point. Do you mean to say that beyond a certain stage you would not be able to train them in this country?—A. Just at present. We are only in the beginning now.

Q. In the beginning you must get competent men from outside. Even in America you imported several hundred English workmen to insure the success of your first efforts to produce steel of the best quality?—A. That will have to be done in India. In America we also send our men to England and other foreign countries.

Q. You say 'I don't think that Indians of the type who would make superintendents or heads of departments would be willing to go through this course of training in this country as they would feel that their social status would be lowered by doing the work of menials which they would have to do if they began at the bottom.' If you find Indians who get rid of that feeling and who are willing to start at the bottom, do you think that in course of time you can train them in this country for the kind of work you refer to?—A. It is possible but in my opinion they could be trained much more rapidly in foreign countries than here.

Q. Do you know that Japan has been training its own young men?—A. I do not know whether this is the case, but I do know that a great number of Japanese are in America studying methods of our manufacture.

Q. Nobody would say that you must take Indians simply because they are Indians irrespective of their efficiency. From your own experience you find that where Indians have been substituted for Europeans the quality and the quantity of the work have not suffered?—A. Yes.

Q. Do you think that if you carry the principle further and appoint more Indians in the higher posts, the results will be equally satisfactory?—A. I think it would not make any difference whether he was a European or a Indian provided he had the same training as a European.

Q. Except in the matter of costs?—A. It costs much more to import people.

Q. You say that if an Indian desires to take up an industrial career instead of continuing his education until he is 22 or 23 years of age he should leave school at 15 or 16 and become an apprentice. Is that the system that prevails in America? Have you not got higher technical schools and universities for training young men for practical work?—A. We have practical demonstration in those colleges. They have their own furnaces or access to manufacturing plants.

Q. If you have similar institutions here which have workshops attached to them where practical demonstration could be given, with the right kind of instructors, then do you think it would be an advantage to Indian youths who wish to take up an industrial career to receive their training at these colleges?—A. Yes.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. I find from the table given in your note that formerly you had in your steel works 55 covenanted hands whereas you now have 36. Have the rest been replaced by Indians?—A. Yes and we have since been producing more steel.

Q. In the Tata Steel Works are the consulting engineer, the construction engineer and the manager all Americans?—A. Yes.

Q. You say that the number of Europeans has been reduced from 55 to 36 and the table shows that the amount paid to local hands was also less with an increase in output. In fact there has been a general improvement?—A. Yes. There has been an increase not only in tonnage but also in efficiency.

Q. That means to say that you have increased your output with a reduction in the cost and there is a real improvement all round?—A. Yes.

Q. The salaries of the covenanted men are just the same?—A. No. Salaries of covenanted men are higher, for when we replaced the Germans by Englishmen and Americans we had to pay higher salaries to these English and American employés.

Q. You said that the three people are Americans?—A. Yes, they are Americans but at present the consulting engineer and the construction engineer are one and the same.

Q. Is it true that you have got only American locomotives?—A. Originally we had only four American locomotives and two blast furnace hoist engines which is a very small proportion of the total machinery.

Q. You generally depend for advice on the consulting engineer?—A. Yes.

Q. And still you have got so much less of American machinery?—A. The four locomotives cost us Rs. 32,000 each and the hoist engines cost us Rs. 16,000 each.

Sir D. J. Tata.—Q. I have heard it said that it takes a generation to make a steel worker. How far is that true, that you cannot be a steel worker under one generation? Would you endorse that statement?—A. That is a pretty big question. It depends a great deal on the men and their training.

Q. I understand that to introduce the steel industry into a new country you would require a generation before the people in the country are sufficiently trained to take up the industry themselves. I want to know what exactly it means? President.—A. It does not mean anything.

Q. My point is that there is a feeling that Indians are not employed in sufficient numbers in these works. These have been going on only for 5 or 6 years. I want to know if any special training is necessary before they could be fit for such employment?—A. That is quite obvious.

Q. You say that Indians should be sent abroad so that they could be made to feel that it is not degrading for men of superior education to begin from the bottom. Can you give us some idea of the nature of work that one has to undergo before he can be trusted to take up responsible positions? How did you yourself commence?—A. My very first experience was that of shovelling coal, firing boilers in a blast furnace plant.

Q. How long were you at that?—A. Four or five months.

Q. How many hours had you to work?—A. 12 hours every night.

Q. How many days a year?—A. 365 days.

Q. You worked every day in the year?—A. Yes.

Q. There is no such thing as half holidays or Sundays?—A. No, not on blast furnace work.

Q. Before anybody is fit to take charge you think he must go through all these stages?—A. I think he must go through every process to be a really efficient man.

Q. So you say that to take up any important position the man must go through all this hard work?—A. Yes. And especially in a new country like India.

Q. Not in an old country?—A. In an old country where the industry has been in existence for sometime and where the organization is complete, there is a sort of steel atmosphere created and the boys go into the mills very young with their parents so that by the time the parent retires the son is ready to replace him.

Q. It would therefore actually be many years before any one could fill the more important positions?—A. Yes. I do not think I would trust anyone who had not a thorough knowledge of the subject to handle a plant of any magnitude.

Dr. E. Hopkinson.—Q. Have you tried the provision of meals inside the works?—A. No not as yet, but I think it would be a very good idea if for no other purpose than to show the employes how to cook food in a sanitary way.

Q. Some of the operations must involve great physical strain on the workmen. Do you find that Indians stand such strains as well as Americans and have equal physical endurance?—A. Taking every department I do not think so. But they are getting better and better. They are improving physically. They will improve further in course of time.

Q. You suggest that when the workman shows an aptitude for anything he should be given facilities. Will you illustrate that?—A. For example, in the bar mills department we start a man with the tongs and if we find he cannot handle them, we put him on reheating furnaces or the producers. And if after two or three trials we find him unsatisfactory we dispense with his services.

Q. It is selection?—A. We try him on one thing and if he is not successful in the first we put him on to another.

Q. At the present time you select the boys and men who go to the night schools and technical classes?—A. If the department head thinks that a boy is clever and that he wants to get along he will tell the secretary of the school and he will select the boy.

Q. Do you think the time will come when you will make it a condition of employment that boys shall attend a night school?—A. Speaking for myself I would not think so.

Hon'ble Pandit M. M. Malaviya.—Q. What was the college training that you received?—A. I went through the University of Alabama.

Q. You had special courses in technology?—A. Yes.

Q. In the smelting of iron?—A. That was in the districts. It was about 30 miles from the college.

Q. Did the college course include the theoretical portion of the education?—A. Yes.

Q. And the practical portion you learnt in the workshops?—A. Yes.

Q. After completing your education at the college you went to the place that you mentioned that was 30 miles away?—A. I went and worked in Birmingham in Alabama.

Q. Was it part of the college course that you should attend some workshop?—A. No.

President.—Q. About these men whom you propose to send to England; when will you send them, before they go to school?—A. I would not send them to England before they get a common school education.

Q. At what age?—A. About 16.

Q. That is cutting right into the fundamental life of the Indian. Are you likely to get any boy of this kind except where his father has been brought up in the works? Do you think that anybody else would send his son to Europe to learn the iron and steel manufacture?—A. That I cannot say.

Q. If he were brought up in the works and actually living in the atmosphere that would be a different thing?—A. Yes.

Q. We have had a number of proposals put forward for the artificial development of industrialism. You say that they should go through the school of hard knocks, but in Europe it has been a matter of hard striving. A man is born in industrial conditions and strives to be the best of his caste. How is that spirit going to be planted in this country?—

A. That is why I said that they should be sent abroad in order that they might imbibe that spirit.

Q. If you had the industries and thereby created the atmosphere you would get a certain number of men who would be able to get a higher form of training either here or abroad than you are likely to by picking the men artificially?—A. That was also my own idea. If a boy were to be in the works and round the works whether he may be still at school or working in some minor position if he showed the aptitude, then that aptitude could be fostered.

Q. The industry then must precede the suitable education. Unless you have the industry you are not going to get the industrialists?—A. All that I mean is to take the boy who shows this aptitude, send him abroad and give him practical and scientific training and then bring him back.

Q. He is not going to show the aptitude unless there is the industry?—A. That is my opinion.

Q. If we start the industry and develop this atmosphere you could pick out suitable boys to send home for training. How are you going to do this in the case of the other industries that are not existing at present?—A. I do not know how that can be done. I am speaking of only the steel industry at Sakchi.

Q. Then in your opinion this is never going to be done unless there are industries in the country. The industries must be started first before the right kind of man can be picked up. There is at present a system which has been experimented upon since 1904 of taking young men from schools and colleges and sending them to Europe with scholarships in order that they might start new industries in the country when they return. What is your opinion on a proposal of that kind where the industries do not exist? Do you think it is possible?—A. It may be possible. But my opinion is that young men should be specially selected and sent to England and placed at the bottom of industries for which it is intended to train them; then after completing their apprenticeship, if the authorities decide that the young men are promising, they should be allowed scholarships so that they can equip themselves with the necessary theoretical knowledge. By this method in my opinion not only will the country be benefited by having industries started on proper lines, but young men would be saved from the disappointment of blasted hopes.

Hon'ble Pandit M. M. Malaviya.—Q. You have told us that in the colleges in your country the workshops now form an essential part of the institution?—A. I do not say in my country.

Q. I thought you said that in your days they were attached to the college?—A. In the Northern State they were. In Alabama they were not.

Q. So far as you are aware in colleges in America workshops are attached for giving practical instruction of a technological kind?—A. That is right in the case of the industrial colleges not only in America but also in England.

Q. What is your experience of the young men trained in these industrial colleges in America? Do you think they come out qualified to start industries or to work in those industries with a view to rise to responsible positions after a few years' experience?—A. They must start at the bottom when they start their college course as their workshop training and their theoretical training go side by side.

Q. Would they be better qualified than the young men whom you would select at the age of 16 and send to Europe or America for training?—A. Yes, for they have a foundation which would help them.

Q. Supposing we have an institution like what you mention at Sakchi where theoretical as well as practical training could be given, and where in addition the young men could be sent to your works for further practical training, do you not think that will give them as good a training for all practical purposes as may be necessary?—A. I think that will give the men a good chance.

Q. You do not think that it is feasible to send out a sufficiently large number of students to England and America at the age of 15 and 16 in order to get a sufficient supply?—A. I do not think it is advisable to send them to America.

Q. The only chance therefore for developing the capacity of Indians is to establish a technological institute at Sakchi?—A. That has been talked of.

Sir D. J. Tata.—Q. With reference to those hard knocks that you refer to, without them you would not have got licked into shape? Were not those knocks rather liberal sometimes?—A. Yes. I think every successful man has to go through those hard knocks.

Q. With regard to yourself you were brought up in an atmosphere of steel. You belong to a family that was accustomed to the surroundings and though you were the son of an employer of labour you did not mind working with your hands and working up your way. Do you think that this is the real road to success, to begin at the bottom and work your way up?—A. I think you should begin at the bottom if you want to succeed, for to specialise in any subject a man should have a thorough knowledge of that subject.

Q. Because you were the son of an employer of labour you did not want to go straight off to a comfortable appointment?—A. If I had that idea, it only took two days to knock it out of my head.

WITNESS No. 131.

DR. A. McWILLIAM, *Government Metallurgical Inspector, Railway Department, Railway Board.*

WRITTEN EVIDENCE.

Q. 5 (7).—The guaranteed purchase of their products by Government has been as the Government assist-
breath of life to Tatas. The Government guaranteed to take 20,000 tons of rails every year
for 10 years if the rails passed the Railway Board's specification. The order amounted in normal
times to some £160,000 or about 24 lakhs of rupees every year or a total of over one and a
half millions sterling. The prestige of having fulfilled contracts for rails for Indian State
Railways, which has been, for so long as I can remember, one of the standards of quality
for common steels together with the most extraordinary series of runs of good luck, have
established them in a firm position when without these they might not have succeeded
with the men they chose. The rebellion in China gave Tatas a market for some 10 lakhs of
tons of pig iron; the fight between the British Indian Steam Navigation Company and the
Japanese firm meant that the pig iron was carried at little more than half the usual freight;
a strike at home then compelled people to use their structural steel at a time when it was
viewed with suspicion and lastly the war came and poured money into their coffers. There
is no doubt room for other steel works but the promoters must depend more for success on
getting the right men and carrying out the operations economically, for no second firm can
hope for such good luck.

Q. 6.—If Government gives some very substantial help they should stipulate that if
possible the general manager of the works or head of the community should be a subject
of the British Empire and there ought to be an understanding that unless good cause could
be shown purchases of plant should be made within the Empire. It is, rightly, I think, one
of the tenets of these firms that the purchase of Indian goods should be encouraged. It is
an obvious extension of the same principle to buy British Empire goods when reasonable.

Q. 14.—There should be no limitation of Government aid from this point of view so long
as it is clear that the new enterprise when properly started can stand by itself when the
preliminary aid is withdrawn. Limits of Govern-
ment assistance.

Qs. 15 and 16.—I have had many years experience of technical and scientific aid Technical aid.
provided by the University of Sheffield. Our experience in Sheffield some 20 odd years ago
was that we were being throttled by Government in return for a paltry grant-in-aid. We
had to cut ourselves adrift and take our own way, in thoroughly scientific work but suited to
the needs of the district, whereas before, we were compelled to work to an ancient standard
pattern the same for the whole kingdom. If a man has an active brain and a soul to guide
him in real work you cannot squeeze them into a universal paper form, without partially
stultifying his work and wasting his energies. After the change our success in numbers was
immediate and our ultimate great success in helping the industries of Sheffield and district
is almost universally recognised. This is mentioned especially as a warning that the throt-
tling tendency of Government interference with research must be considered so as to be
avoided.

Q. 17.—Private firms or companies should pay for the services of the Government experts.
I have done a great amount of consultation and advisory work free for firms that were con-
sidered not able to pay or under circumstances that were against charging a fee but the sum
of my experience is that most firms wish to pay, that all firms ought to pay and that it is the
way to make them begin to appreciate the value of the help.

Q. 18.—It should be understood from the beginning that Government would permit the
publication of the results of researches made by a Government paid expert when attached to
a private firm, unless they considered it unwise for military reasons, and that the firm should
allow publication unless they could show that it would be detrimental to their business
interests and then only to stay publication for a maximum of 3 years. I have found as a
rule that when firms did not wish results to be published I had formed the opinion myself that
it would not be fair to ask for it and on the other hand when I had decided that publication
would not injure the firm they have agreed and given their consent, generally asking for the
lapse of a year or so, some stipulating that no names should be mentioned whilst others were
quite pleased to have their names associated with the encouragement of research and the use
of its results. Recently it has become so fashionable that it is a form of advertisement for
firms.

Q. 19.—The iron and steel industry here is so small that I do not think a demonstration Demonstration
factories.
factory would be needed, but I have suggested that in the proposed new technological insti-
tute at Sakchi or elsewhere a small electrical furnace preferably of the induction or Kjellin
type—the arc type will be used in the works—should be provided as so many industrial steel
processes can be imitated and reactions and results studied both by bad and by good methods.
I have used one of these furnaces to imitate processes so divergent as crucible steel melting
and the working of a basic furnace to make mild steel from an all-pig charge. The same
furnace by an easily made change of the bed can be used for the manufacture of non-ferrous
alloys.

One part of our laboratories in the University of Sheffield is practically a works in miniature making single heats up to 2½ tons, where correct methods can be studied, inferior methods done to show why they are inferior, and new ideas tried at a comparatively small cost. We were, I believe, the first to make a vanadium-chromium steel successfully in the open hearth when vanadium cost just a sovereign a pound and it was found highly profitable on a large scale.

Research abroad.

Q. 22.—A considerable amount of value and proving of ground could be obtained by using consulting and experimental experts at home. The expense should not be greater and might be less for certain work than doing it here and the responsibility incurred would be very much less because trial investigations could be made as a test of their value to the industries and of the demand for them, and after each investigation or set of investigations is finished no further liability is involved. This would be especially valuable until India had her own research department, if it was decided to have one, for the standard of man who could be used in this way would be very expensive to bring out or might not be procurable. I had some interest in a very good example of this at home. The large works find that it pays them now not only to have a good man for research but to have a department for research that has no routine manufacturing responsibility. When I was on leave I was offered the headship of one of these. To enable the commissioners to estimate what percentage to deduct from the value of the above suggestion I ought to mention that it is most likely that I shall soon be a consulting metallurgist at home.

Surveys for industrial purposes.

Qs. 25, 26 and 27.—Just as we are taught about military operations, so the roads to success are laid by sound reliable information as full and detailed as possible, that deposits which would be valuable may be very small parts of the crust. The Geological Survey would search for these and on discovery make them well known and the Government industrial experts if in existence or private enterprise would examine the deposits to judge of their industrial value as Tatas have done so successfully. There have been important discoveries of commercially valuable deposits other than coal even in England within the last ten years.

Government patronage.

Q. 37.—The articles of iron and steel are, I think, well known. The great products of Tatas for example are structural steels to British standard and one railway's specification, rails all but one to British standard section and to different specifications mainly the Railway Board's.

Training of labour.

Qs. 44 to 46.—Owing to the decay of the apprenticeship system and the increased specialisation of the worker in engineering, the provision of means of increasing his knowledge of machine tools and in engineering and metallurgy of his industry generally, have been much appreciated. A young man is working all day at one machine only and cannot get a job at anything else. He comes to the technical school or college in the evening and can become fairly proficient in the use of other tools, the lathe, the planing machine, the milling machine, and so on. He is thus also introduced into a home of learning and in many cases goes very much further than was his original intention, taking up drawing and studying the more theoretical subjects connected with his work. Managers of works have come for training that was not available in their youth, and I always had a profound respect for them as not only wise but very brave men. We had one well known proprietor and public worker who took his place beside one of his own furnace labourers who had felt something better within him. In metallurgy a young man may be doing analysis only. He earns furnace work at the college and in many cases thus gets his chance of going out into the works. When at home I found one such who had become works manager and director of an important firm, and there are many similar.

Q. 50.—Industrial schools should be under a Department of Industries.

Training of supervising and technical staff.

Q. 51.—If these men are to be trained instead of imported there should be technical colleges for this purpose. Of that I have had great experience which may be summed up in that they are not very difficult to design but that their success depends on the difficult task of getting the right man to carry out the ideas properly and of clinging to as much freedom of action as possible.

Q. 52.—No help should be given to supervisors, managers and technical experts of private firms to study conditions and methods in other countries. The firms should attend to it if they are fit to live.

Q. 53.—As Government should interfere with the firms assisted as little as possible after they can stand alone, firms should not be required to train experts, but might be asked to do so if it was desirable.

Organisation of technical and scientific departments.

Qs. 64 to 66, 68 and 70 to 74.—There might be sufficient demand for the services of a permanent metallurgical expert, and the difficulty would be to get the right man who ought to be selected with the greatest care for his practical knowledge and experience in research. The degree of the need could probably be tested first after the manner of my answer to 22, but, however any proposed research department may be constituted, the head should be responsible to some one as high up in Government as feasible and the head of the metallurgical or any other section should be as independent as it could be arranged, the relationships between him and the head of the whole being something like that of an English University professor to his Vice-Chancellor, his own freedom being of the same nature. He should be allowed to get into direct correspondence with firms as to supply of chemicals and apparatus and to the extent of his budget to order personally from them, any small disadvantages as to

freight being much more than counterbalanced by his living contact with sources of supply and his ability to meet his own requirements as they occur.

Local Governments should only engage their own experts when either they think that there is sufficient work for them in sight or they have practically the monopoly of an industry. It would be advisable to test the market and find how best these experts could be obtained and on what terms. Technological institutes founded should be developed as part of a large scheme but with a great degree of individual independence. There should be an understanding as to the subjects they would take up but no hard-and-fast rule. For instance we were supposed to concentrate on iron and steel but had we been debarred from undertaking research on gold and copper we would have missed some pieces of excellent work that were of value not only to the local gold and silver industries but for the important light they shed on iron and steel difficulties. The Government control should be as light as possible and Imperial unless in special circumstances where provincial seemed desirable after a full and fair consideration of the position. There should be elasticity in the arrangements made.

Q. 77.—It should be a settled principle that every reasonable facility should be given to Study of foreign Government technical and scientific experts to study conditions and methods in other countries. An iron and steel expert is isolated here. I was astonished when I went home to brush up after a little more than 3 years to find how much had been done.

Q. 78.—I have not much difficulty as I have a good library of my own. A properly chosen library is a splendid investment and a central one for all industries should be formed. The volumes could be available on loan by post to persons interested on payment of the postage and a deposit of the value of the book. Books on industry are mostly written now-a-days not by purely literary men acting as compilers but by recognised experts and often in the works a man will make out of a good book in a month more than its total value.

Q. 78.—I could give dozens of examples of advantages following the issue of special Government monographs. One will suffice. An old student who though the only son of the proprietor of a works had come to us from his own town and gone through our most thorough training in the early days of our work, became the unusual combination of a good scientist, a first class technologist and a most successful captain of industry. I saw his works soon after he returned to them. His father gave him his head and the last time I saw his place before the war he had had to make it from 3 to 4 times as large. Once many years ago I was feeling a bit depressed about manufacturers apparently not making as much use as they might of our published results. I mentioned the subject to him for when we met we went right down into the heart of whatever technical matters cropped up. "Name a subject" "Well that alloy of a couple of years ago," indicating it. "Hoot awa' man, I've hundreds of tons of it running about London alone already and I didn't do it for fun. You go on, we study every line you publish and use most of it". If I could tell you what I saw when last I went round those works it would make a dramatic sequel of success and emphasise the value of such work not only for industry but in providing apparatus of great protective value in the country's time of need to a degree of perfection that could not have been attained without the skill acquired by such fundamental training and long practice on sound lines.

Q. 88.—Experts might be employed to condense the information published each year in technical papers and publish the result in pamphlet form, adding a list of references to researches and other matter not suitable for condensation not omitting such details as prices, names of publishers and a rough idea of the contents. Something of the kind is given in the Iron and Steel Institute's volumes and in "Nature's" reviews of the literature of science. For many years until I left for India I reviewed the metallurgical works on iron and steel for "Nature." The small fee paid is not the attraction though it establishes agreeable relationships, but there is a fascination about it which seems to enable them to get good men to do the work. There is the honour of being chosen and the freedom of being allowed to say what you think. The pamphlets should be written for the benefit of the reader, not for the safety of the writer. Longmuir and I in our book on 'Foundry Practice' braved the criticism of the censorious by publishing in our chapter on pyrometry approximate prices of the pyrometers we had used and described and the names of the firms from whom they could be obtained as the subject was then so new for the foundry that we felt it would not be much use to the manager if he did not have some idea of prices whether it was a penny cone or a twenty guinea optical and where he could get the thing when he had decided what he would risk on a trial. I remember being delighted to find that one of the best practical big gun hardeners of the old school that I knew had taken to carrying an optical pyrometer with him to his giddy height to check his judgment by his well trained eyes.

Qs. 89 and 90.—For structural steel, rails, fishplates and a few other items this system has been in successful operation in Sakchi for nearly four years. It is conducted as part of the ordinary work of my department under the control of the Railway Board and is, I think, well known to the trade.

Q 96.—Partnerships should be freely disclosed so that it is known with whom one is trading.

Q. 94.—The whole trend of my replies will show my conviction that it pays a country to obtain as much as accurate and as detailed information as possible and to make it easily available. Unless in very special cases the development should be left to private enterprise but hastened or encouraged by Government.

Jail competition.

Q. 109.—I have always considered that it is a fallacy that prisoners should not be put to hard and useful labour. It seems to me that it gives those who have good in them a chance of reforming and becoming valuable members of society. It is a delicate question but if jail authorities sell at market prices the industries should be capable of being organised so as not to be injurious to the community.

ORAL EVIDENCE, 11TH DECEMBER 1916.

President.—Q. You say that when Government officials are lent to do any research work on behalf of private firms, publication should be allowed "unless they could show that it would be detrimental to their business interests, and then only to stay publication for a maximum of three years." If publication is through the ordinary Government medium, is it necessary to define any maximum at all? Generally the Government publications give a fair time to the company to get a start?—A. The name of the works should not be mentioned if the firm objects to it being given.

Q. No, but he realises that if the research is conducted on his works, he would get a great advantage; he would get over the difficult stage between research and actual practice, and so obtain a sufficient start; and Government by publishing results would satisfy the public that nothing was being held back?—A. I put three years as a maximum. In my own case I found that a year was about all the time wanted.

Q. The people who own the works and are in touch with the research going on really have a great advantage?—A. Yes.

Q. When I was in Madras I heard a story to this effect that Government were allowing the steel produced at Sakchi to be passed at a lower standard than was accepted in England for rails, and the insinuation was that this was done purposely, to give the Tata Iron and Steel Company an unusually good chance. I should like to know from you how the standard adopted by you compares with the standard specified at home?—A. The standard adopted by us for inspection purposes is the standard that is given out by the consulting engineer for the Indian State Railways, and other Railways may accept that standard or not, as they please, but one railway may have a different standard of their own which has nothing to do with India or with the home standard; it is simply their standard.

Q. Your standard then is the same as the English standard, or at any rate the same standard adopted by the India Office for Indian State Railways?—A. Yes, and other railways have their own specification. Different railways have different specifications; that has nothing to do with India or with any other place.

Q. Then I have been told the converse story that your method of inspection is more rigid than that adopted by English inspectors for English companies; is that so?—A. I think if you will take the mean of these two, you will get just about the right thing.

Q. Why should I take the mean when you have told me that the standard is just the same?—A. You have had one tale that the standard is very much easier, and you have had the other tale that the standard is more severe. If you take the mean you will find out what is just about right. I have given you the plain statement that it is the same.

Q. Do they, as in England, take a sample from the actual steel and trace it right through the works until you come to the rail and test the rail also?—A. It used to be one rail in 500 tons, but it has been changed to one in 100 tons.

Q. Is that method adopted generally at home?—A. Oh, yes; that is the general practice.

Q. That is to say, samples are also taken from the molten steel as well as from the rail?—A. Yes, so far as I know.

Q. Is that the practice in England?—A. Yes.

Q. I suppose with an established iron and steel works, the number of actual tests made might safely be reduced when you know the works have reached the requisite standard of regular production?—A. Yes, that might be so. You judge by the general quality of work of the people.

Q. Are you given latitude as to the number of tests you shall make, or does the specification rigidly force you to take a certain number of tests from the molten steel as well as from the rails?—A. The specification lays that down.

Q. And you have to take certain tests?—A. That is what I have to do.

Q. So that one can safely say that the test is exactly the same?—A. For all practical purposes. No two human beings can do a piece of work exactly the same, but so far as the specification can make the inspector do the same, they are the same.

Q. With regard to the employment of metallurgists, you speak as if there was room in India for the employment of only one or two metallurgists?—A. I am speaking of an iron and steel metallurgist.

Q. Is it not possible that we might require in India metallurgists for other base metals and for metallurgical research work generally; would it not be better if we had part of a chemical department devoted to metallurgy?—A. I hope you will never have a metallurgical department as part of chemical department. It must be separate, or you are doomed to failure. I would not have chemists mixed up with metallurgy, not even in research work.

Q. You mean that you would not have your metallurgist in your chemical department; you don't mean you won't have a chemical department?—A. You must have a chemical department; the modern metallurgist is first of all a chemist.

Q. That is why I suggest that the metallurgist should form part of the chemical department?—A. Then he is doomed to failure at once.

Q. You would like a chemical department and a metallurgical department separately?—A. I am not saying I would like either of them. The thing is that the metallurgist must be responsible to some one as high up as possible in Government, and must not be part of a pure science department, otherwise he would be doomed.

Q. It would be essentially a department for applied chemistry?—A. You want my opinion, and you want it on the basis of my experience. I have been through it, and am not theorising.

Q. Where were you as a metallurgist forming part of a chemical department?—A. I was not, but I know of one.

Q. Where did you know one?—A. I am not going to say that, but you know the places as well as I do.

Q. Suppose there were a chemical department of the Government of India, with 100 or 150 chemists and between 15 and 20 metallurgists. If you had such a chemical department, the chief chemist would of course be—from the official point of view—a 'big bug.' If, however, you have a separate metallurgical department, the head metallurgist would not be of the same official dimensions and would be likely to suffer unless he has a chief who is in a sufficiently good position to stick up for the rights of metallurgy. There is much work to be done also in the metallurgy of minerals, copper, etc., and for that we want metallurgical chemists?—A. All my evidence is dealing with iron and steel; I am a specialist in iron and steel.

Q. If you had a single metallurgist in iron and steel, or, say, two, it would be a little bit difficult to give them positions in India as part of a department, and give them the opportunity of rising to a post to which any first-class metallurgist would hope to rise, unless he was part of a bigger department, and could ultimately obtain an administrative position?—A. I have been through it all. That does not alter my opinion in the slightest. I would rather have an isolated metallurgical department, of whatever size it may be, and you want a first-class man for this work.

Q. How are you going to get the junior man, unless there is some prospect for him to look to; if there is only one man ahead of him, there is no prospect of his rising to that man's post?—A. I have not thought of that. I have given you my experience. Until you have that man independent of the chemical department, you are doomed to failure.

Q. At present you are employed on a temporary agreement?—A. I am not employed as metallurgist to the Government of India; I am employed as Metallurgical Inspector to the Government of India.

Q. Don't you think the two might be combined very well?—A. Most certainly. They use me as a metallurgist when they require that kind of work.

Q. Then there would be room for a bigger department?—A. Yes.

Q. But if one provides a little department for every sub-division of a subject, how many departments would we have, and who would control them?—A. I don't know.

Q. You have a suggestion in your evidence that short-time men should be brought out. The short-time men are said never to have the interests of the country or firm at heart and even in your case you are looking forward shortly to taking up a consulting post at home?—A. Yes, look at my age. My interests have been the interests of this country while I have been here; absolutely.

Q. We want to look forward to long and continued service for every good man we get?—A. It is not necessary for him to look forward. A man in my position has to make and keep his reputation.

Q. Instead of getting out short-time men, would it be possible to have a system of fellowships or scholarships for men of the assistant lecturer class to come out for two or three years, with scholarships of £250 a year, so that from among these we would be able to recruit men for the scientific departments?—A. We find a great deal of inconvenience in employing men for 5 years. Sometimes you get a young man who is very keen and instead of doing the mechanical work required of him—as every official must do—he is occupied in publishing papers which will get him a good name for a better post somewhere else. There is a great deal of mechanical work to be done, and someone must do it. That is one of the reasons why short-time appointments have not been successful.

Q. Do you think we can get over this difficulty by a system of scholarships or fellowships?—A. I could not say. My idea was to bring out men who had made their reputation.

Q. You have gone right through the history of the Tata Iron and Steel Company, you have been there from the beginning?—A. From the beginning of production.

Q. Can you tell us, for instance, about the troubles that were first met with in connection with basic steel manufacture, and how the troubles were overcome?—A. Yes. That is one point that I think would be of interest to you in connection with the various questions you are

taking up. First of all there were a number of German steel makers brought in, and as they were not producing material for Government inspection, I was not kept very busy at that time. I looked round and found that they were working on what I considered to be wrong lines. The firm were seriously considering shutting down the steel plant altogether, and the Government asked me whether I could put things right. I said that I could and I was lent for the purpose to the Tata Iron and Steel Company, I changed the system of manufacture from what I considered to be a wrong one into the correct system in my opinion for this country, and for the men that were here, and that, with slight differences, has been the system that is used up to the present time.

Q. Successfully?—A. Successfully, and the slight differences are not, in my opinion, improvements.

Q. Going to Germany for the methods, the men and the machinery was mistaken policy?—A. I think so. That is one of the things I would like to mention here. In the speech that Sir Dorabji Tata made recently he gave credit for the basic open hearth to Germany, as a German speciality. As a recognised expert I say that that is simply not the case; that the basic open hearth is a truly English process.

Q. It is British in origin, in any case?—A. Yes, and British in working up. The basic process was brought out by Thomas and Gilchrist. It was also worked out practically and made extensive use of, and the only thing Germany did was to take it up and use it also. Before she was taught by Great Britain she had not the ghost of an idea how to do it. Far from being a German speciality it is a British speciality in that it was brought out by Britain and carried to a successful issue, scientific, theoretical and commercial.

Mr. C. E. Low.—Q. You speak of the assistance given by the Sheffield University to industries; how was that managed; under what terms and by what arrangement do the Sheffield people do a piece of research, say, for a firm?—A. It has not been very much on those lines; it has been in this way; the department of applied science of the university conducted researches originally for the simple reason that the things were not known, and if we had to teach them to somebody, we had first to find them out, and during these researches men were trained who enabled the University and Sheffield to keep in the forefront in regard to the making of the special steels for which Sheffield is famous.

Q. Have you had any investigations of the sort where a firm has asked you to take up special research on their account?—A. Not much of it, because we have trained men to skill in research, who have been able to do it themselves. Many of my old students have worked out very splendid work in that way, coming to us for help and advice, and keeping in touch all the time. I might mention that the firms find that it pays them to keep, not a research man but a research department. You will see the kind of man they want when on my way home on leave recently I was cabled the offer to stay at home as head of the research department of a firm.

Q. How many men do such a department take?—A. I think they have about 14 men in the particular place I allude to, who have absolutely no manufacturing responsibilities.

Dr. F. Hopkinson.—Q. Are you quoting the numbers at Hadfield?—A. The whole works is a research department at Hadfields. It is not a normal case. There is a research department which paid 25 per cent. in normal times.

Mr. C. E. Low.—Q. Is there a research department in Tata's Steel works?—A. No, "not yet," Sir Dorabji says.

Q. How was it that England left the tungsten steel business to Germany, as she did?—A. That is not quite correct. England never let the high-speed or tungsten steel business out of her hands.

Q. There were people in Germany making it?—A. You could not count on the fingers of your two hands the firms that were making high-speed or tungsten steel in Sheffield before the war.

Q. Our information out here is that most of the tungsten was exported to Germany?—A. Ah, tungsten! You are quite right that they allowed the manufacture of tungsten to go into Germany.

Q. You cannot get tungsten steel without making tungsten?

President.—Q. The fact is that wolfram went to Germany, and tungsten was made in Germany. This tungsten was practically purchased in England for the manufacture of tungsten steel. Mr. Low wanted to know why tungsten steel went out of the country?—A. That is not the case.

Q. As you are not interested in tungsten but only in tungsten steel, he does not ask the supplementary question as to why tungsten went out?—A. May I just sum it up? The point is that tungsten steel has been made in Sheffield in enormous quantities beginning about 1870, and they only allowed the manufacture of tungsten to go, but tungsten steels require the exercise of great skill in mixing, melting, forging and heat treating and that skill seems to be centred in Sheffield more than anywhere else.

Mr. C. E. Low.—Q. That does not interest us so much, but the point we are after is this. What are we to do to prevent the tungsten ore going to Germany in future?—A. (No reply was elicited from witness.)

Q. In your answer to question 17 you say that private firms or companies should pay for the services of the Government experts. You are considering there Government experts in an advisory capacity?—A. Yes.

Q. You don't contemplate the case, as we have to do in this Commission, of Government lending the services of an expert in an executive capacity, as a responsible manager?—A. In any case I say firms ought to pay.

Q. Do you think there will be any difficulty, supposing Government lent the services of an expert as manager of a department of a firm, in regard to control?—A. Yes. There would be difficulty. As an expert lent to a firm as manager of a department, I should have my way or give the thing up.

Q. You say there would be difficulty; how could that be got over?—A. I am only thinking of the one case; taking the steel business, if you don't have your way in it, you might as well go out.

Q. If the firm asked for the services of such a man, it would definitely have to recognise that he was boss of his own job entirely?—A. It must be so, otherwise he could not work to a successful issue.

Q. In your answer to questions 25, 26 and 27, you say the Geological Survey would search for deposits in the way they do at present. Do you contemplate their carrying the process any further than they carry it at present, i.e., giving more knowledge than at present about the probable extent and nature of the deposit?—A. I am afraid I am not sufficiently acquainted with how far they carry it at present. I merely state the position, and practically the whole of my evidence may be taken that it pays a country to get reliable practical information in whatever way, they can, and that kind of information could be obtained by the Geological Survey, but not to hamper them to get detailed information. For example, they got the information about the Gurumaishini iron ore.

President.—Q. Do you mean that the Geological Department should not go any further than establish what is known as a prospecting proposition, and then the actual proving of the ground should be done by private owners?—A. Yes, that is exactly it.

Hon'ble Pandit M. M. Malaviya.—Q. You say with justifiable patriotic pride that Germany learnt the system of the open hearth from you?—A. From Great Britain.

Q. And so did the Americans?—A. Yes.

Q. But is it not a fact that now this open hearth system is practised more in Germany and Austria than in England; are you not following the Bessemer system more and more in England?—A. No.

Q. Do you mean that the open hearth system is not more followed in Germany than in England?—A. The general tendency all over America is to go to the open hearth. There are two systems and you can work by either, the acid and the basic systems, but there is a tendency to go from the Bessemer to the open hearth.

Q. So that now in England the tendency is quite as great as in America and Germany to go to the open hearth system?—A. Practically all over the world. It is the general tendency in the whole world.

Q. You suggest here that "if Government gives some very substantial help, they should stipulate that if possible the general manager of the works or head of the community should be a subject of the British Empire, and there ought to be an understanding that unless good cause could be shown, purchases of plant should be made within the Empire." Of course putting aside these present deplorable war conditions, would you lay down such a proposition in those broad words at the present moment, or wait to see the fiscal policy of the Government when the same is decided?—A. I foresaw this long ago; it has nothing to do with the war whatever.

Q. Of course some countries excel in one kind of machinery and some in other kinds of machinery. Suppose you want to develop the match industry and you import match machinery from Germany, would it not be better in that case from the commercial point of view to bring out Germans to work that machinery?—A. The last sentence of that paragraph reads, "It is an obvious extension of the same principle to buy British Empire goods when reasonable."

Q. That is perfectly intelligible. I only want to be instructed about the practical facilities for carrying out your proposal. Take for instance America. Suppose you have got some machinery made in America, in which America excels; and suppose it is desirable, from a commercial point of view, to produce cheaper goods in order to compete with foreign goods, it is obviously desirable that we should get the best machinery in the world, and it may be necessary to engage workmen who are familiar with that machinery in order to work it, or set it up and work it in the first instance; in that case the restriction which you suggest would work to the detriment of the Indian industry?—A. I think all the conditions you have mentioned would make it fairly reasonable, so it comes in the end of my paragraph "when reasonable."

Q. So that you would not make it a general hard-and-fast rule, but would make it a recommendation?—A. That is clearly stated in my paragraph. I don't think it could be clearer. The firm would bring up their reasons in that case.

Q. Would you require some restrictions; would it not be better to give freedom to the promoters of the company to obtain such machinery as they think best, and to obtain such technical assistance as they think fit?—A. I don't like using the word "hampers;" that is not within the meaning of my paragraph. I would not do anything to hamper any industry at all; and if they are so thoroughly well up in the thing that they can make these decisions, I think they should be so well up in it that they ought not to ask for Government help.

Q. But no trade can be so well up as to dispense altogether with Government patronage; it may do without Government help. The trade of no country can do without Government patronage. Suppose Government patronises the products of an Indian firm; would you insist that the conditions mentioned here should apply, say, to a match factory, if it received Government patronage?—A. It would not apply where Government was buying the matches in the open market, but if they guaranteed purchase—I am speaking of iron and steel all the while—then it would apply. You are starting this match factory, you put your matches on the market and Government buys them because they think them better at the price than anybody else's, that has nothing to do either with you or with Government; but if you ask Government to guarantee to buy a million and a half pounds worth of your matches within the next ten years, then you come under my paragraph.

Q. You know that Government has laid down a definite policy that they will encourage indigenous goods within certain conditions. That being the policy, every industry that lives and thrives in this country is likely, generally speaking, to receive some Government patronage?—A. In what way; in my first way or second way?

Q. In the way that I suggest; that Government encourages it in purchasing its products, where it has to buy its products; not because of the guarantee you mention, but in pursuance of the general policy that Government will encourage indigenous industries by purchasing indigenous goods. In that case it will be a case of Government patronising the industry, and putting aside the question of the amount or value of the purchase money, the question of principle would be the same?—A. Once every year the Government would simply buy or not, as they thought fit, on the particular condition of this match industry that you are running; but that is a very different matter to saying that whenever you are making steel up to quality, then we will buy so much value per annum, for ten years from you, these are two different things. Then it is merely an extension of Swadeshi to the Empire.

Q. You see the Government has laid down the policy that it will encourage indigenous goods if they are fairly equal to the foreign goods which are imported, and if the price is also reasonable. Suppose the Americans are making steel quite as good and cheaper than the Indians; then the Government cannot under that policy purchase Indian steel however much it may desire it, until it changes that policy. Supposing that by purchasing machinery from one particular country, say, America—America has been producing machinery cheaper and it may be as good as English—suppose it is—I will give you a concrete case; for instance, in the case of ice-making; there was a factory in Delhi which worked with machinery which was not American. Shortly after a gentlemen bought American machinery, and it began to make ice so cheap that it was sold at a quarter of the price of the other factory's ice. There is no restriction on anybody in the world coming to India and establishing a firm. Suppose the Americans come and establish a steel trade in India and are able to make goods cheap. The Government, if they paid a higher price for the Indian-made article, would cause a loss to the tax-payer, so that if the Government were to take the interests of the tax-payer it ought to purchase things made by the American firm. How would that work? If an Indian firm finds that it is more profitable to import American machinery, in order to enable it to compete with American products, and in the beginning gets American men to work it, would you not encourage the industry in order that it should establish itself in this country?—A. That is entirely the spirit of my evidence. I think that would be most reasonable. You are not saying anything different from the tone of my evidence.

Q. I want to make it clear that the condition that you have recommended cannot be of general application; its application must be determined by the special circumstances of each case?—A. Of course that is perfectly clear in my evidence, "it is an obvious extension of the same principle to buy British Empire goods when reasonable."

Q. Things made in the Empire don't stand on the same footing as far as India is concerned as things made in the United Kingdom, because the political relations of India with the colonies are not as good as those with the United Kingdom; so I think you will qualify your remarks so far as the Empire is concerned?—A. That is beyond me; I am not a politician, I am only a metallurgist.

Q. You said that you had students at Sheffield; am I right in thinking that you were at the Sheffield University as a professor?—A. That is so.

Q. For many years?—A. Yes, but not as a professor all the time.

Q. I understand you to say that technological colleges should be established in this country?—A. I don't say that they should be established; I say if men are to be trained.

Q. You have no decided opinion as to whether they should or should not be?—A. No, that is not in my line.

Q. Assuming that it is considered necessary, in view of the steel trade that is growing; are you or are you not of opinion that it is desirable to train men in this country instead of

relying upon importing men from outside?—A. I think that is quite clear in my answer. I took a very long time over this to make it as clear as possible.

Q. I take it that in answering questions 64 to 74, you have kept the University of Sheffield before your mind. With those clearly laid down qualifications, do you think that there will be any difficulty in establishing a technological college at Sakchi to train up men who might take up the work of supervisors and superintendents at the steel works at Sakchi?—A. We are working at that privately.

Q. You say, "One part of our laboratories in the University of Sheffield is practically a works in miniature, making single heats up to $2\frac{1}{2}$ tons, where correct methods can be studied, inferior methods done to show why they are inferior, and new ideas tried at a comparatively small cost." Do you think that with similar works being made a part of the technological institute, training of a higher kind could be imparted at Sakchi?—A. For the supervisors, but not yet for the superintendents.

Q. In your opinion would the men whom you would turn out as supervisors at the college I am talking about, receive the finishing touch by a year or two or three years' stay in England?—A. Yes.

Q. Then they could be entrusted with the work of superintendents?—A. That does not follow.

Q. Not necessarily, but if the man has it in him, these three years' training will complete his education as a metallurgical engineer?—A. Oh no, he must come into the works and begin.

Q. That is why I ask you about the works. You have some works attached to the Sheffield University; you give a man a training there in theory and practice; then you put him into other works and let him work for some time?—A. No, he sees to himself; then he goes and finds a post in the commercial works.

Q. And after some time in the works you would send him on to England. After you have put a young man through a theoretical and practical course at a University or technological institute, founded on the lines of Sheffield, would you send him to England to complete his education in two or three years, or do you think he will be good enough to get on here and gather experience of work at Sakchi, and rise in time to be a superintendent without going out?—A. That is a very big question.

President.—Q. You contemplate having this technological college at Sakchi; would you take a young man in at 19?—A. We would take him in at 16.

Q. Then give him three years' training?—A. Yes.

Q. After three years' training would you want him to go through the works at Sakchi before going to England?—A. There is one type of remark in all these questions that jars on me; "you put him through," "you send him here," "you push him there," and so on. That is absolutely opposed to my system of training. We provided the facilities and the young man came to us, did the work, went out into the world, found a post and did things.

Hon'ble Pandit M. M. Malaviya.—Q. You put the idea into his head?—A. Yes. He could go into the works there, but of course it would have a broadening effect for him to go out and get into other works.

President.—Q. It would be better to go into the works first, or go home?—A. No, he should go home, right away if he was going. You will remember we are assuming that the technological college will be in Sakchi and he would be about the works all the time.

Hon'ble Pandit M. M. Malaviya.—Q. You say in answer to question 17, "Private firms or companies should pay for the services of the Government experts," and that "all firms ought to pay, and that is the way to make them begin to appreciate the value of the help." You are aware that in many matters the Government has helped industries, and the help has been beneficial. For instance in indigo, sugar, cotton and silk. You don't mean to suggest that these firms should have to pay for any problem that they may send up to the research institute, for which the Government might think it fit to depute one of its experts?—A. There are two points of view; one where the expert is asked to come down to the works, take up a certain difficulty and clear it up. For that the Government expert ought to be paid by the firm. There is another point of view, where Government have decided that a certain piece of experimental work should be done for the good of the community at large, and they either do or do not take advantage of a particular works that is in existence. In that case the Government would pay the cost of the experiment for the general good. These are two quite distinct types.

Q. It is only in a case where a problem, special to a private firm, is to be dealt with that you would wish the firm to pay?—A. Yes.

Hon'ble Sir Fusulbhoy Currimbhoy.—Q. When you wrote your reply to question 6, were you aware that the Tatas did their best to get blast furnaces from England, but failed, and so had to go to other countries?—A. I am not aware of that.

Q. In 1909 they tried their best to get the blast furnaces and had to go to Germany and got them at 10 per cent. less. With their manager too they did their best and could not get a man, and had to go to America. In these circumstances you have made it clear that if these difficulties occur, that they be allowed to do so?—A. If these difficulties have occurred, then it is reasonable.

Q. Then you say, "it is rightly one of the tenets of these firms that the purchase of Indian goods should be encouraged." I am sure you are aware that Indian railways had to buy their rails through the home authorities; although they could get the thing in India. In that case, don't you think that a firm like the Tata Iron and Steel Company is not commercially treated well? You want them to purchase their plant from within the Empire, and at the same time allow the Indian railways to indent their rails from England, when they could have very well got them from here?—A. The Tatas have sold all the rails they made.

Q. In the beginning they had a lot of difficulty to sell outside?—A. But you must understand that no firm in England will get what the Tatas got; the promise to take their rails. You have to establish your reputation before you get a State order at home.

Q. The materials pass your specification. What more do you want?—A. That question gives me the opportunity of explaining a point that is of great importance. I have met many people who seem to think that if a thing passes the specification it is as good as it can be. It must be remembered that of materials that pass the specification there are all grades from those that just pass up to any degree of excellence above that. Some firms take little notice of specifications on certain materials, but making theirs to be sure to pass do much more than that for the sake of their own reputation. The fact that two firms both make materials that pass the specification does not mean these firms make materials of equal quality.

Sir D. J. Tata.—Q. You have just said that it roused your anger to find the Chairman of the Tata Iron and Steel Company in his speech had made certain remarks about German open hearth furnaces. You object to my having said that open hearth furnaces are a German speciality. I am sorry to find that you took the expression "a German speciality" to mean that they originated in Germany. To explain what I mean when I speak of "a German speciality" I would ask: is it not true that in Germany they use the open hearth process more than the Bessemer process, and that Germany makes a speciality of the open hearth as against the Bessemer process?—A. In Great Britain they use both processes, and you are not going to take the question as a matter of weight or tonnage.

Q. What tonnage do they make in England by the Bessemer process and what by the open hearth; which is the greater? When I say that it is a German speciality what I mean is that the open hearth was practically more used in Germany than in England, and that consequently more men trained in the open hearth process were available there than anywhere else. We might not have been able to get them in England so easily. I did not suggest that open hearth furnaces were not originated in England, or that they originated in Germany. I might say that the dye industry is a German speciality, though I know that the whole of it originated in England, but the Germans made a speciality of practising it. England is now making great efforts to retrieve her position. This is what I mean by a German speciality. I do not say that England knew nothing about the open hearth system, but that the practice of the open hearth system is greater in Germany than in England?—A. You give the dye industry as an illustration. The dye industry was one that was brought out in England. Then it was allowed to go to Germany, and they took it up and practised it. That is not the case with the basic open hearth process. It is practised to a very large extent and with success commercially in England, and it is not in any sense of the word a German speciality like the dye trade.

Q. But it is not followed in England to the same extent as in Germany. Germany is almost exclusively basic?—A. Because they cannot get any ore for anything else.

Q. In America, where both systems are practised, the rails made on the basic system are, I understand, preferred to those made on the Bessemer system, and they charge 2 dollars more for the basic than the Bessemer steel?—A. That again is giving a wrong impression.

Q. With reference to the evidence given by Mr. Tutwiler, I would like to ask one question. He has been at Sakchi for some time now, and there have been statements made that at Sakchi Indians do not receive any encouragement with regard to employment. You have been there and know the treatment that Indians receive, and what they are doing there. Have you any experience in that connection which you would like to relate to us, especially with regard to Mr. Tutwiler's attempts to teach Indian employes?—A. So far as Mr. Tutwiler is concerned, he has done more to employ Indians in more responsible posts than any other man. That is an undoubted fact, not an opinion.

President.—Q. I presume that if there had been any other general manager, and the works had attained the present state of evolution, the other manager would have done the same. Is it a fair statement that Indians have not been given a fair chance?—A. No, so far as I know.

Q. The statement has been made publicly that the employment of Indians at Sakchi is only pretence. In your opinion is it perfectly true that Indians have been more largely employed and have displaced a certain number of Europeans?—A. Yes, they have been more and more employed.

Q. And you are satisfied that some very satisfactory results have been obtained by the change?—A. I don't think that in one particular department where they are almost exclusively employed the standard is quite as high as it was when there was European labour.

Q. Possibly the change in that department has been a little rapid?—A. Possibly.

Q. In view of what you have seen at Sakchi, do you feel that there is reasonable hope of employing Indians in large numbers for work of that kind, that they are really accomplishing

themselves to the new conditions satisfactorily?—A. Yes, so far as they are employed at the present time.

Dr. E. Hopkinson.—Q. Where do you carry out your manufacturing tests for the Government of India?—A. We have an island site on Government ground within the Tata works.

Q. There is no independent laboratory?—A. It is an independent laboratory. The ground we work on is Government ground.

Q. Only mechanical tests are carried on there?—A. No, all the tests.

Q. Are the British standards adopted by the Government of India?—A. For structural steel the British standard is adopted by most firms ordering. There is still one railway that adopts the Indian State Railway standard. The British standard specification for rails does not apply to the basic open hearth at all. It is the Railway Board's or Indian State Railway's standard specification that is used.

Q. You approve of indigenous industries like the Tata Iron and Steel Company but insist upon the necessity of Government guaranteeing orders, provided that the goods are up to specification?—A. Yes, I approve, but I have nothing to do with Government guaranteeing orders.

Q. But you don't make any reference as to the question of price?—A. It must be at the same price. The agreement with regard to that in normal times is at the price of the home market *plus* freight, etc.

Q. That is the case in your reference to it here?—A. Yes, the price is guided by the prices in the market *c. i. f.* Calcutta.

Q. No advantage is given them as regards price?—A. None whatever.

Q. You speak of your experience at Sheffield, and say that university was throttled by Government?—A. That was over 20 years ago.

Q. If you can, in a couple of sentences, kindly explain what you mean?—A. We were given, as stated a small grant-in-aid. We were then at the beginning of things. In return for that we had to work to a standard form which was not suitable to the district at all, and was very ancient. We found that that throttled us. A number of our men put their heads together and said, "Let us tell the Government to keep their grant-in-aid."

Q. What do you mean by a "standard form"?—A. If you were teaching metallurgy in Sheffield, you would have to teach it on the same lines as everywhere else in the United Kingdom.

President.—Q. The Government does not lay down any standard for the university?—A. This was when we were Firth College.

Dr. E. Hopkinson.—Q. You say in answer to question 50, "Industrial schools should be under a Department of Industries." Do you include in industrial schools, technical colleges and technical schools?—A. The industrial schools are of a type which try to teach a man the elements of a trade outside the part he is doing in the works. The technological college, I don't know what you would put it under. At home in some cases it is put under the City Council.

Q. You don't suggest that it should be so in India?—A. I am not well enough informed to express an opinion. When it is put under the Department of General Education it is so far distant from their principal work that it cannot get its views considered.

President.—Q. Dr. Hopkinson wants to know whether in addition to the industrial school teaching trade, you would put the technical school under the Department of Industry?—A. I do not know the system of Government here, and I meant that at any rate it should be under the ordinary Department of Industries.

Dr. E. Hopkinson.—Q. You would not have the technical school under the Department of Education?—A. No.

Q. Nor a technological college in which research work is carried on?—A. No, I would still have it away from the Department of Elementary Education.

Q. I fail to understand your answer to question 51?—A. It is considered to be rather a mystery in designing, *i. e.*, the getting up of the buildings of a technical college, designing them and putting the plant in.

Q. You refer to buildings and equipment?—A. Yes. It is not very difficult either deciding that you will have this and that professor. The difficulty is in getting the right professor. I have seen some very good work done with poor material when you had good men. If you want your technical college to be a success, it is not the building and equipment and design of how many professors you will have that is difficult, but it is getting the right man to carry out ideas properly.

Q. I understand now that you consider the difficulty lies in designing a professor?—A. It is not very difficult to design the nature or number of the professors you are going to have.

Q. In reference to question 77, would you go so far as to say that the Government of India ought to allow its expert officers extra leave to bring themselves up-to-date from time to time?—A. I am afraid that I was thinking of a case such as mine where the leave was inadequate for this purpose. I only get three months leave in three years. It would have to be special leave for that particular purpose.

Q. Without conditions ; simply to bring himself up-to-date ?—A. They would have to show cause. I was sent for a particular purpose and had to make a programme which had to be passed by the authorities. It has, I understand, been done in the Geological Survey of India for a number of years.

WITNESS No. 132.

Dr. H. H.
Hayden.

DR. H. H. HAYDEN, C.I.E., *Director, Geological Survey of India.*

WRITTEN EVIDENCE.

Technical aid to
industries.

Qs. 15 & 16.—The Geological Survey has always kept well in view the economic aspects of its work, but it is only in comparatively recent years that circumstances have arisen which have led the department to take the prominent place that it now occupies in the matter of advice and assistance towards the development of the mineral resources of India. In the year 1903 the Director saw that the time had come for a policy of active co-operation with those interested in mineral enterprise. He introduced a well-defined system of interpretation and co-ordination of the researches carried out by the members of his department, with the object of bringing prominently before the public the value of the mineral resources of India, many of which were either lying untouched or were being only inadequately developed ; and he took steps to collect and issue in a concise and simple form facts and figures relating to existing and potential mineral industries.

A characteristic feature of the policy of the Geological Survey throughout the history of the department has been the active operations undertaken from time to time with Government funds either with a view to assisting existing industries or to developing new ones. As one of several instances of this policy, I may cite the boring operations carried out by the Geological Survey in the Singhbhum copper belt, which have led to the mining operations now proceeding in that area.

In addition to carrying out specific investigations, the members of the Geological Survey are constantly called on for technical information. This is freely given, both by correspondence from headquarters and also personally by officers when in the field. In special cases (*e.g.*, wolfram mining in Burma) opinions and advice are also given ; but assistance of this kind is rendered on the understanding that it shall be used only for legitimate purposes.

Q. 17.—It has not been customary to lend the services of officers of the department to private companies or firms, although this has been done on rare occasions ; in such cases the results of the investigations ought, I think, to be communicated to Government, the communication being, if necessary, treated as confidential ; the results, however, should be published where such a course is compatible with a due regard for the legitimate interests of the firm or company concerned.

Q. 18.—It would be difficult, if not impossible, to lay down any hard-and-fast rule on this subject, and each case must be treated on its own merits.

Research abroad.

Q. 21.—With a cadre so small as that of the Geological Survey it is impossible to deal with all the problems that arise in connection with the mineral industries of this country. Attention has necessarily been directed to the more pressing questions, and assistance has also been sought from external sources, such as the scientific and technical department of the Imperial Institute. Specimens have been referred to the latter department from time to time for analysis and for opinion on the prospects of their successful use for industrial purposes. The results of those references have not been satisfactory, partly owing to the long delay before replies were received, and partly to the fact that the information supplied has not always been correct. This latter is a serious drawback, for it destroys confidence in all information communicated. The failure to quote authorities for "expert" opinions has also been a cause of complaint. The Geological Survey has therefore ceased for some time past to make use of the scientific and technical department of the Imperial Institute, and in recent years we have referred to mineral brokers for information and have sent analytical work that we could not undertake ourselves to professional analytical chemists.

The above disadvantages of the Imperial Institute could no doubt be obviated, except in so far as the first might be due to a greater amount of work than the staff were able to cope with. If they were remedied, we could again avail ourselves of the services of the department not only for information generally but also for specific researches which require special apparatus or conditions not to be found at present in India. Such a department with headquarters in London has unusual facilities for keeping abreast of unpublished developments of industrial processes and in touch with the British and Continental mineral markets.

Qs. 22 & 24.—The necessity for the despatch of materials to the Imperial Institute or elsewhere would be largely obviated if a greater amount of scientific and industrial research could be done in this country. Much, I think, might be done by co-ordination of the facilities afforded by the various educational institutions, but I will refer to this more fully below under "Co-ordination of research." At the same time there would be certain advantages in having an intermediary—whether a department of the Imperial Institute or any other body—in

England to which we could send bulk samples of Indian minerals for working tests on a commercial scale by appropriate industrial concerns. It is possible that the Advisory Council for Research in the United Kingdom might undertake this duty but the actual channel through which samples should be distributed is a matter of detail so long as it is efficient. Beyond this aspect of industrial research, which in certain cases, could not be dealt with in India, I would like to see all our work done in this country. In that case, however, co-ordination would be essential, and it would be necessary to form some body corresponding to the Advisory Council for Research in the United Kingdom to undertake that duty.

Qs. 25 & 26.—Although a great deal has been done since the creation of the Geological Survey towards the investigation of the mineral resources of the Indian Empire, much still remains. The lines on which the Geological Survey works are well known, and it is not necessary for me to define them in detail.* The primary object in view is the completion of the geological map of India. This involves a systematic survey of the whole country, and naturally includes a systematic mineral survey, all occurrences of minerals of economic value being recorded on the geological map. In view of the small cadre of the department, it is inevitable that the completion of the geological map, and of the concurrent mineral survey, should be still far distant.

Surveys for industrial purposes.

Q. 26.—The ultimate aim of the systematic survey is the development of the mineral resources of the country, and it has not unfrequently been suggested that the staff of the Geological Survey, instead of carrying out that systematic work, should devote its energies to looking for minerals of economic value. To anyone acquainted with the subject the wastefulness of employing a geological staff merely as an army of prospectors is self-evident, but the suggestion has been seriously put forward so frequently that it is necessary to emphasise the unwisdom of such a course, which must result in the dissipation of the energies of the staff. The majority of the staff of the Geological Survey, therefore, is employed on systematic work, but at the same time a certain proportion is set aside to carry out specific economic investigations likely to yield results of more or less immediate value. The more important minerals known to be of industrial value and to occur in considerable quantities in India have been taken up individually, their occurrence studied, and monographs prepared on them. These monographs are published as memoirs, and are readily accessible to the general public.

In addition to the officers employed on systematic survey and those engaged on investigations relating to specific minerals of economic value, one officer is kept at headquarters in charge of the laboratory and museum and deals with specimens submitted for determination; he also assists the Director in dealing with the numerous enquiries coming in from day to day from every part of India. The above briefly represents the lines on which the Geological Survey is organised and those which, in my opinion, are the most suitable for a department of the kind in this country.

Q. 27.—The dissemination of the information collected by such a department can be readily effected by means of publications such as the *Records* and *Memoirs* of the Geological Survey.

A comparison of the cadre of the scientific departments in India with that of similar departments in any of the leading western countries shows that this country is considerably understaffed. Thus, the cadre of the Geological Survey of India is 20, that of the Geological Survey of America, about 164, while that of Great Britain is proportionately even larger, viz., 34. It is not surprising, therefore, that many problems that ought to be worked out in this country cannot be attempted. So far as geology is concerned, an important need is chemical assistance. It is only within recent years that a chemist has been added to the staff of the Geological Survey although we could profitably keep several steadily employed; for chemistry, like geology, includes many branches, and no one man can specialize in all.

Organization of technical and scientific departments.

It has been suggested that the best way of meeting the needs of the country in this respect would be to create a chemical department, with a staff sufficiently large to include specialists in all branches and capable of undertaking any specific enquiry referred to it by other scientific departments of Government. Such a department would be of great value. It should be an Imperial Department analogous in constitution to the Geological Survey and subordinate to one of the departments of the Government of India. It would probably be advisable to allow it to undertake work for private individuals, although this should not be permitted to interfere with the business of firms of analytical chemists in this country. The services of officers of the department might from time to time be put at the disposal of Local Governments or of other departments (Q. 67), but I consider it essential for efficient administration that the members of the staff should, wherever employed, remain under the control of the head of their department, and should not be transferred to Local Governments, which are not in a position to exercise the expert supervision required.

Imperial Department.

Another subject to which it has not yet been possible to devote the attention it deserves in this country is that of subterranean water-supply. A certain amount of work has been done by the Geological Survey, as well as by officers attached to the various Local Governments, but this has necessarily been spasmodic and lacking in co-ordination. The subject is one which the Geological Survey has long wished to take up, and had it not been for the war, I should have approached Government on the subject some time ago; but even when the Department is at its full strength, the cadre is so small that it would be impossible

Subterranean Water-supply.

* *Vide* his oral evidence for further details.

to devote the services of more than one, or at the outside, two officers to the work. The results that have been attained in Australia and America show the benefit to be derived from systematic work in this direction, and although there are large tracts of country in India which offer no prospects of any considerable subterranean water-supply, there are others, where water is badly needed, which call for examination. Mere superficial examination is not sufficient, and it would be necessary to undertake boring operations concurrently with surveys. At present work of the kind is left to Local Governments, which do not as a rule possess staffs having the expert knowledge required. The investigation is one which, I think, might advantageously be co-ordinated and undertaken by a special Imperial department or branch of an Imperial department.

Co-ordination of
research.

Qs. 21 & 74.—In addition to a new scientific department or departments to deal with branches of science at present unrepresented in this country, there should also be appointed a body to co-ordinate and deal with scientific and technical research. This in a more limited sense was the primary object in a view when the Board of Scientific Advice was created, but the present constitution of the Board is not, I think, suitable for the more extended scope now contemplated. It would no longer be merely a question of bringing into line the work of the scientific departments of Government but of co-ordinating the whole of the research work in this country wherever carried out, and therefore all the scientific and technical institutions in India would necessarily be involved (Qs. 71, 73). The nucleus for such a body might be obtained from among the members of the Board of Scientific Advice, but additional members should be chosen from the staffs of the Universities, colleges and technical institutions which are in a position to undertake research. A good field for selection would be found among the members of the Indian Science Congress (Q. 76), which either does, or should, include all the members of the Board of Scientific Advice, but membership of the advisory body should not be restricted to Government servants. The body so constituted might form an Advisory Board or Council analogous to the Advisory Council for research in the United Kingdom; it might consist of a central committee and number of smaller sub-committees, each of the latter dealing with one subject or group of allied subjects; each sub-committee should keep itself fully acquainted with all research work in its particular line being carried out in India, and should at the same time keep in touch with parallel lines of research in other parts of the world. Such a body might replace the present Board of Scientific Advice. I should not be disposed to give it executive powers, but to retain it rather as an advisory body. Problems referred to it would be communicated by the central committee to the appropriate sub-committee, which, if it considered investigation desirable, would advise as to the most suitable channel, whether in his country or abroad, through which it might be carried out.

Technological
institutions.

Q. 72.—The various educational institutions in India should be encouraged to take up each its own line and to specialise in some particular branch of research. Such specialization would make for efficiency and economy, for individual institutions would be able to make the most of their funds in the direction of equipment both as regards apparatus and literature. There would thus be formed throughout the country a number of very complete specialized libraries (Q. 78). At the present time Calcutta is the only centre in India which can be said to have fairly complete libraries in most branches of science, and these are not particularly accessible to workers in other parts of India. The Geological Survey is exceptional in that it not only places its library at the disposal of any one who wishes to read there, but sends books to all parts of India on loan. This privilege appears to be much appreciated, and has never been abused. If the same principle were adopted by other scientific libraries, there would be less ground for complaint as to the inaccessibility of literature to those engaged in research in this country.

Reference
libraries.

The suggestion made in the last paragraph with regard to specialized libraries is offered with a view to meeting the needs of those engaged in research and does not embrace the question of reference libraries for the study of science generally. More libraries of the latter class are desirable in India, and leading scientific text-books and periodicals ought to be available in at least four or five centres throughout the country (Q. 79).

General official
administration and
organisation.

I would not recommend that the suggested Advisory Board should have executive powers. (Q. 62). It would be preferable to give those to a department to be created specially to deal with industrial development and research in all their branches, and I would place under its control not only the scientific departments but also all Government institutions and laboratories in which science is taught or practised, except those engaged in medical research. I would also include among its staff specialists who could advise the Imperial and Local Governments with regard to individual industries not dealt with by the scientific departments; in this category I would include such industries as glass-making, pottery, etc. The member in charge of the department should have the highest possible scientific attainments and should at the same time have shown himself interested in the application of science to industry. The same department might conveniently be responsible also for industrial schools (Q. 80). If the latter, as well as the scientific institutions and laboratories which are now under the Education Department, were placed under the new department, complication involving questions of dual control might be expected to arise; this difficulty might perhaps be obviated by the transfer of the portfolio of Education to the member in charge of the proposed Department of Industries.

Study of foreign
methods.

Q. 77.—In order to derive full benefit from the services of the expert and scientific staff employed under a Department of Industries, it is necessary that the members should be

encouraged to keep their knowledge up-to-date. The best means to that end would be the grant of study-leave, such as is given to the Indian Medical Service and the Geological Survey. Such encouragement need not necessarily be restricted to Government employes, but might be extended, in the form of grants or scholarships to members of private industrial concerns. (Q. 52). Such grants or scholarships might replace the present system of State technical scholarships.

In the matter of collection and distribution of commercial intelligence, a direction in which development might take place with advantage, is towards making available information as to the names of firms or individuals in India who deal in specific articles. I frequently receive mineral specimens with requests for information as to a possible market for them in this country. The Geological Survey has amassed a considerable amount of information of the kind, but it has not been possible to collect it systematically, nor is it complete. The following is an example of what is required: comparatively recently my department has received numerous samples of china-clay and has been asked to put the senders into touch with possible purchasers. In such cases it would have been convenient if there had been any source to which I could have turned for information as to all firms in India who deal in china-clay.

Among the subjects which, in my opinion, call for investigation as regards the General feasibility of establishing new mineral industries, I would mention aluminium, artificial fertilisers, sulphuric acid, alkalis, ferro-chrome, ferro-manganese, ferro-tungsten, micanite. For all these industries we have raw materials in the Indian Empire, and the aspect which seems to me to require special investigation is the financial one in each case. Such questions as arise are:—

Is there anything to prevent the Bawdwin zinc ores being reduced in the Indian Empire and their sulphur being made available in this country for the manufacture of sulphuric acid?

If acid were produced in large quantities, would it be absorbed?

Could India compete with Europe for the eastern market for sulphate of ammonia and superphosphates?

Would it not be more economical to export a part of our production of manganese chromium and wolfram in the forms of ferro-manganese, ferro-chrome and ferro-tungsten respectively?

Are conditions suitable for aluminium manufacture in this country?

Could we find a market for the metal if it were produced in large quantities?

Is it possible for India herself to produce all or any of the coal-tar products which she now imports in large quantities?

These and many similar questions involve the collection of information not available in this country, as to the conditions—as regards production, distribution, finance, etc.,—governing the industries concerned, in other parts of the world.

Q. 104.—Although many of the minerals which we possess in India are essential for industries of Imperial importance, I would not recommend that they should be developed at the expense of the State, except in cases in which there was small prospect of their being developed by private enterprise. I know of only one class of minerals which might at present be regarded as an exception, *viz.*, the radio-active minerals.

ORAL EVIDENCE, 12TH DECEMBER 1916.

President.—Q. I notice that in your written evidence you refer to the lines on which the Geological Survey is organised, but you do not give in full detail the scope of the work that is undertaken by your department?—A. I have some further notes that might go into the middle of my answer to questions 25 and 26 where I say, "The lines on which the Geological Survey works are well known, and it is not necessary for me to define them in detail." I can give a brief outline of the general scheme of the department. The scope of the department is clearly defined and the work organised in such a manner that there shall be no overlapping with that of other scientific departments. At the same time the department is so constituted that it is in a position to deal with geology in all its branches. This is only possible by means of organisation whereby officers are encouraged to specialize in certain directions, the result being a body of men capable of dealing in the aggregate with problems in all branches of geology, whether pure or applied, including in that category stratigraphy, palaeontology, petrology, mineral chemistry and mineralogy in all its aspects whether systematic, economic or statistical. Another important branch of activity of the Geological Survey is that connected with education. For many years past officers of the department have been engaged in teaching geology in the Presidency College at Calcutta, in the Calcutta University, in Poona and in Madras. This arrangement is advantageous to officers who may have specialized in particular directions for they are still kept in touch with advances in other branches of geology and are thus enabled to keep their general knowledge completely up-to-date. The advantages gained by the educational establishments are equally great or greater, since they could not obtain elsewhere lectures with such an intimate knowledge of Indian geology. In addition to theoretical instruction, the department also assists in the practical training of students, and places its library.

laboratory and museum at the disposal of those seriously engaged in geological research; research scholars are received in the laboratory and are guided and assisted in their work by members of the department. There are also a number of young men employed in the museum and laboratory as museum assistants, field collectors, etc., who can either continue in Government service or have opportunities from time to time of leaving us and taking up more lucrative private work. The latter system would, I think, be capable of development on the lines of apprenticeship, although such a system could not be expected to be successful until the general ideas prevailing in this country in regard to it have undergone some modification.

Q. What do you mean by that last sentence, "until the general ideas prevailing in this country in regard to it have undergone some modification"?—A. I get enquiries from young men who write and say that they wish to learn geology and would like to come and join my department, and then ask me if I would guarantee them appointments. It is not quite my idea of apprenticeship.

Q. You must always get a large number of young men in every country who are ignorant of how these things are done. That does not discourage you from continuing the system of apprenticeship and it will enable you to pick up the right kind of men and train them?—A. We have apprentices, not necessarily in geology, but they are not entirely satisfactory. They do not regard it as their duty to attend office every day; still some are certainly doing good work.

Q. Your note refers to the possible conditions abroad. I do not know if you have ever considered or heard the suggestion that I made in 1906 to the Imperial Institute Committee, that there should be in London a trade representative from India and there should be attached to him one geological officer and at least two officers connected with agriculture, forestry or other departments dealing with vegetable products. The idea was that these officers should be at home for about two or three years; they should be senior enough to know India and Indian conditions but junior enough to bring back with them when they returned to India a certain number of ideas picked up when attached to the trade representative in London. Their business would be to advise the trade representative regarding mineral questions, to distribute information to those who are interested in mineral development as to the kind of minerals that ought to be investigated and the lines on which research work should be carried on. Have you had an opportunity of considering a scheme of that kind?—A. No. The matter has not been brought before me in any way, but I remember your outlines of it and I remember a certain amount of correspondence about it. I consider that it would be an excellent scheme. I think it will be extremely valuable not only in the interests of mineral industries, but also in those of the departments concerned.

Q. I understand that you have still the system of study leave. Is that system taken advantage of?—A. Yes.

Q. And you find it of real use to the department?—A. Yes. I find it quite satisfactory.

Q. Will you turn to your answer to question 21. In referring to your correspondence with the Imperial Institute you say "The results of these references have not been satisfactory, partly owing to the long delay before replies were received, and partly to the fact that the information supplied has not always been correct. This latter is a serious drawback because it destroys confidence in all information communicated." Can you give us any examples of any report from the Imperial Institute that you have found to be unsatisfactory in this respect?—A. As a concrete case I may mention that six specimens of laterite (bauxite) were sent to the Imperial Institute in January 1905 for analysis and report. No reply was received for nearly two years (January 1907). The report then furnished contained what purported to be, in essential points, a description of Bayer's process for the extraction of alumina from bauxite; but was incorrect in regard to the essential feature of that process. Had the information at the disposal of the Director of the Geological Survey not been more accurate than that of the Director of the Imperial Institute, we should have published an erroneous statement which might have been seriously misleading. The mistake led to a further delay of eight months before the results could be published, since it was necessary to refer the report back to its author for revision. In most other cases the delay was equally great, ranging from a little over a year to four years. Another cause of complaint was the failure of the Director of the Imperial Institute to quote authorities for "expert" opinions obtained on our behalf.

Q. Have you seen the lecture delivered by Professor Dunstan before the Society of Arts and which is reproduced in the Bulletin of the Imperial Institute for April-June 1916? In it he states that in 1905 he suggested that a special search should be made in India for thorium minerals, but that the Government of India did not consider this necessary, as the Geological Survey was alive to the importance of the subject. The Director of the Institute further states that there the matter rested until about 1909, when a German prospector discovered monazite in Travancore, and that the deposits were afterwards worked by a company under German control and in German interests. This incident was quoted among others by Professor Dunstan to show that the Imperial Institute "should be a valuable auxiliary to the operations of the Geological Survey of India." Can you tell us if the possible occurrence of monazite in India had been recognised by the Geological Survey before this suggestion was received from the Director of the Imperial Institute, and what steps were taken to prevent the matter being overlooked?—A. The possibility of the occurrence of monazite and other minerals of the rare earths was certainly recognised by the Geological Survey before 1905.

and had often been discussed by the officers among themselves. The matter was referred to in print in the Review of Mineral Production for the years 1898-1903 published in the Records in January 1905. In addition to this, officers were warned to keep a careful look-out for such minerals, especially monazite, in the course of their field work.

Mr. C. E. Low.—Q. Were specimens sent to the Nagpur Exhibition of 1908-09 and was the attention of prospectors drawn to the mineral?—A. Yes.

The officers were warned to look out for monazite from 1903 onwards?—A. Yes.

President.—Q. That statement of Professor Dunstan's was apparently misunderstood by certain newspapers who imagined that there was a certain amount of apathy on the part of the Geological Survey of India. What I want to know is this, was this suggestion, when made by the Director of the Imperial Institute, answered in any way that would give him to suppose that his suggestion would be neglected?—A. Certainly not. The papers in my office show that his suggestion was dealt with not only in a despatch by the Government of India, but also in a letter written to him direct by you and dated May 15th, 1905. The Government of India asked the Secretary of State to thank him for his suggestion, while you wrote to him at considerable length, pointing out that the Geological Survey had had the matter in mind for several years, and you explained fully the grounds on which it was clearly inadvisable to divert officers from more important work to this investigation. You also expressed your pleasure on hearing that he was prepared to take up the determination of rare minerals, and offered to send materials to the Imperial Institute from time to time.

Q. As the monazite occurs in the Travancore State, it is beyond the ordinary range of the Geological Survey of India. But did any officer of the Geological Survey enter Travancore between 1905, when the suggestion was made, and 1909, when the monazite discovery was made?—A. No officer visited Travancore during that period.

Q. The following statement was published in a London paper, the *Indiaman*, of the 8th September 1916. "There can be no doubt that if the Geological Survey of India had recognised that the Travancore sand was rich in monazite, and if the deposits had been properly brought to the notice of the various British firms interested, the Indian monazite supplies would not have fallen into German hands." This statement not only challenges the system of administration in your department, but reflects on the personal efficiency of the officer who acted as Director after my departure from India and before you took over charge. It is important therefore to know:—(1) whether, on learning of the discovery of monazite in Travancore, any steps were taken to verify it, (2) whether the attention of Government was drawn to the importance of the discovery, and (3) whether and what steps were taken to inform the public?—A. (1) Messrs. Pearson and Schomburg, who were both prospecting in South India, were in close touch with the Geological Survey, and frequently sent specimens for determination. As soon as monazite was discovered in Travancore, we asked them for specimens, which were forwarded to us with full information. (2) Immediately on hearing of the discovery, the officiating Director of the Geological Survey drew the attention of Government to it and to its probable importance, and suggested that the Travancore Durbar should be asked to permit an officer of the Geological Survey to visit the deposits. (3) Attention was drawn to the discovery in the next issue of the *Records* which happened to be the Quinquennial Review of Mineral Production for the years 1904-1908—a publication which has a wider circulation than any other issued by the Geological Survey. In addition to that specimens were sent to the Nagpur Exhibition to draw the attention of prospectors to the discovery of monazite.

Q. Do you remember the date of the unofficial note sent to the Government of India by Mr. LaTouche in 1909 after the discovery of monazite?—A. I think it was 10th October 1909, but I am not quite sure.

Q. And the date when the Quinquennial Review of Mineral Production was published?—A. That came out in May 1910. That was the next issue of the publication.

Q. What was the nationality of the company that was granted a lease to work monazite sands in Travancore?—A. British; The London Cosmopolitan Mining Company, which was registered in England on the 5th December 1907. It had been in existence for two years before then as a British company.

Q. Have you any official knowledge as to what steps were taken to verify the nationality of this company in addition to the fact that it was registered in London on the 5th December 1907?—A. No.

Q. Did this pioneer company obtain a monopoly of the known monazite deposits in Travancore?—A. No. A company is, at the present moment, I believe, working or preparing to work areas which were not taken up by the original company.

Q. Can you give any idea as to how the monazite came to be sold to Germany and how the company came virtually under the control of Germans? In other words, what was the real origin of what the writer in the *Indiaman* describes as "the scandal of the German capture of Travancore monazite," which he attributes to the negligence of the Geological Survey?—A. According to a letter in "Journal of Gas Lighting" of September 1st, 1914, from the Secretary of the Travancore Minerals Company, that company had made a contract for the whole of its output "with the only firm in Europe" capable of taking such an output. It was further stated that up to the outbreak of war only one application had reached the company from England, for supplies of monazite and that the applicant was supplied with all

the sand that was asked for. According to the *Times* of October 14th, 1916, although the Government of India had made a special reservation that none but a British company should hold the concession, enquiries subsequently proved that the company was British only in name although it was registered in England, and that all the preference shares and a large number of the ordinary shares were held in trust for the Deutsche Gasluhlicht Gesellschaft of Berlin, the nominal holders being an English company.

Q. That is a matter beyond the ken and control of the Geological Survey?—A. It is quite beyond my province. I only found it out from the published prints.

Q. The author of the articles in the *Indiaman* quotes, in support of his condemnation of the Geological Survey, the statement referred to before as published by the Director of the Imperial Institute, Professor Dunstan, whom he refers to as one "whose authority Sir Thomas Holland will not question." It had not occurred to me before to regard him as an authority on Indian geology, and perhaps you can help to clear up this matter. I understand that Professor Dunstan did once pay a short visit to India somewhere about 1913, and in view of his statement that the Imperial Institute should be a valuable auxiliary to the operations of the Geological Survey of India, I should like to know whether Professor Dunstan communicated with you during his stay in India?—A. He did not. I believe that Professor Dunstan paid a visit to India a few years ago, but I am afraid I cannot give you the exact date. I have heard it was early in 1913, but as he neither wrote to me nor visited me, I am not in a position to give any definite information on the subject.

Q. Were your personal relations cordial?—A. I had never met him. Our official relations were perfectly friendly.

Q. If the Imperial Institute is subsidised to co-operate with the Geological Survey, did Professor Dunstan inform you that he had deputed two young men to undertake a geological survey of Gwalior State, and did either of these men consult you as to their work or their results? I am asking you this question, because I discovered that the matter had been concealed from me while I was the only representative of India on the Advisory Committee of the Imperial Institute?—A. I received no information on the subject. In fact, I only heard of their presence in India accidentally through a member of one of my field parties which was working in Central India.

Q. I want to refer to another subject now. The neglect to investigate the Khewra potash deposits is referred to in an article published in the *Indiaman* of the 19th May 1916 as "one other example of the Indian Geological Survey's neglect of the commercial and industrial side of its work." It is stated that, while these deposits were known in 1873, it was only when war broke out in 1914 that the survey, after forty years' neglect of the subject, began to investigate the Khewra deposits. The writer asserts that "this is not a creditable state of things in a country like India, whose chief industry is agriculture, for which potash is a vital necessity." The remark about the value of potash to Indian agriculture we know, from other reliable witnesses, to be due to ignorance of Indian conditions; but is it true, in any case, that the Geological Survey neglected to investigate the Khewra potash deposits?—A. Certainly not. So far from neglecting the deposits, the Geological Survey has had the matter in mind continuously since 1903. Before that, information was published in the *Manual of the Geology of India* both in part 3 (1881) and in part 4 (1887). In 1904 the matter was taken up again in collaboration with the Commissioner, Northern India Salt Revenue, and, as you say in your letter of August 11th to the *Indiaman*, the deposits were inspected and samples and analyses were sent to chemical manufacturers both in India and in England. The opinions received from commercial sources in the latter country indicated the poverty of the deposits, but did not justify their total condemnation. The work was therefore continued, and an officer of the Geological Survey was again sent to the salt range in January 1912, and an abstract of the results of his investigations was published in the *Records* issued in May 1913, while a more complete paper was published also in the *Records* in December 1914. The investigation is still continuing although the work carried out so far justifies the statement made in your letter of August 11th to the *Indiaman* that the known deposits would be "relatively too small poor and irregular to be commercially worth working so long as cheaper German supplies were available". The investigation is not yet complete, and I should like to point out that the deposits that have to be examined extend over a distance of something like 200 miles; some considerable time is required therefore for their complete investigation and it is possible that we may find better material later on. But the remark made by you in your letter is entirely justified.

Q. You have read the letter that I have sent to the *Indiaman* to correct these statements. Presumably Prof. Dunstan wishes the public still to imagine that "the scandal of the German capture of Travancore monazite" and "the discreditable neglect of the commercial and industrial side of the Khewra potash deposits" are due to the negligence on the part of the Geological Survey. I should like to know whether the statements made in the letter published on the 11th August were correct or not?—A. The statements made by you in your letter of the 11th August, so far as I know, are entirely correct and are borne out by the documents and files in my department.

Q. Coming back to the question of the Imperial Institute, you are probably aware of the fact that at different times I pointed out, as Director of the Geological Survey, that the Imperial Institute might be of value to the Geological Survey of India, as, for instance, in the way described in that letter of May 1905, that you quoted at the beginning. Do you think I was

ever justified in assuming that the Imperial Institute still might be of assistance to the Geological Survey?—*A.* Undoubtedly it might, but I do not think there is much use hoping for any assistance from it with the present personnel.

Q. In the statement published by the Director of the Imperial Institute in his Bulletin for April-June last, he states that the monazite deposits of Travancore were discovered by a German prospector, Schomburg, and that they afterwards came under German control. I understand that Mr. Schomburg is a naturalised British subject, and is thus at liberty to test the legal value of this misdescription; but can you tell us if Mr. Schomburg gave the officers of the Geological Survey reasonable opportunities of learning the truth about his discovery?—*A.* Yes. Mr. Schomburg sent us specimens and gave us every information and assistance, and when an officer of the Geological Survey was sent to Travancore he helped him in every possible way. Mr. Schomburg was an independent prospector.

Q. You had no reason to suppose that he was in any way duping the Geological Survey?—*A.* No.

Q. As he was working for a British company you had no reason to suppose that the enterprise was not British?—*A.* No.

Q. As the material was in the Travancore State it was beyond the province of the Geological Survey?—*A.* Yes.

Q. You say that one of the subjects that might be taken up more thoroughly is the question of subterranean water-supply. Had you in your mind the idea that the Geological Survey might be enlarged or that some other department might be organised with a view to making a survey of the subterranean water?—*A.* What was in my mind was that possibly a party might be detached from the Geological Survey for that purpose; but that would be difficult with our present staff.

Q. They have also done this in Australia?—*A.* Yes.

Mr. Chatterton.—*Q.* An officer of the Geological Survey was deputed to Madras for this purpose five years ago?—*A.* Officers are deputed from time to time for specific enquiries but not on a general survey. Mr. Tipper went to Madras some years ago.

Q. It is a matter that requires not only geological investigation but engineering tests?—*A.* Yes.

Mr. C. E. Low.—*Q.* With reference to your remarks under "Imperial Department," suppose you had a man under the Imperial Chemical Department investigating chemical problems with reference to say, tanning, the result of this work would be matters for which the tanning expert would be immediately responsible, whereas, in the Geological Survey, chemical questions relating to chemical geology are matters for which you are immediately responsible. Presumably your idea is to have the grading and recruitment and promotion of this department under the Imperial Chemical Department under a single head and a certain amount of technical control on the chemical side invested in a single head, but if these men were set to work on special lines of work it would bring them very largely under the control of the person in charge of that expert department? Do you think it is likely to cause any difficulty in working, or do you think it can be arranged?—*A.* I do not see why it should.

Q. There is that difference?—*A.* Undoubtedly.

Q. There is, of course, a certain amount of analogy, but it is not complete. There are, of course, other departments which could be thought of in which the analogy might be more complete?—*A.* I should have thought that the position of a man of that sort lent to work out a specific problem for a department would be more or less similar, in his relation to the Local Government, to that of an officer of the Geological Survey working out a specific problem in one of the provinces.

Q. You would refer in particular to the position of the two officers of your department being directly under the control of the Local Government of Burma?—*A.* I do not think that principle is altogether good.

Q. But to a large extent it is an entirely new departure?—*A.* Yes.

Q. Is it one that you would like to see extended?—*A.* No. The other method of working was introduced before I became Director and was on the whole more satisfactory. Officers, say, in Burma who carried out any investigation that they were asked to do sent reports as to their results to the Local Government direct and sent copies to the Director of the Geological Survey in Calcutta. That was done in order to save time. The Local Government could also refer to the officer in charge of the party direct for advice. I think the position of the two officers of the Geological Survey placed in exceptional circumstances directly under the Local Government is hardly analogous, because that is more a question of urgent investigation which has to be carried out in a hurry and there are certain factors of provincial administration which I should have thought would hardly come in in the case of a chemical officer attached or lent to another department.

Q. Suppose you follow the instance which I gave you just now of a man who investigates chemical questions in connection with tanning, the local provincial department might be administratively concerned with choosing a site for a tannery and organising a company to work it?—*A.* Yes. The chemist would no doubt be expected to carry out the investigation as

put to him by the department for whom he was working, and to some extent he would have to be under that department.

Q. The two officers who were sent still refer to you on technical points?—A. Yes.

Q. Do they report to you regularly?—A. Yes. They report to me and send copies of their reports to the Local Government.

Sir F. H. Stewart.—Q. You recommend the formation of an Imperial Department of Industries. The head of it should be an ordinary Member of the Viceroy's Council?—A. Yes.

Q. Assuming that that it is not considered practicable, do you think that industries could more properly be handed over to any other of the existing memberships?—A. I think the department would require a member to itself.

Q. You are quite clear that it will be good to have a separate department in itself?—A. Undoubtedly I think so.

Q. You recommend the formation of an Imperial Department of Science and Industry?—A. Yes. I am not particular about the title.

Q. With reference to your paragraph about subterranean water-supply, that department would then be expected to take up this question?—A. Yes.

Q. And the work could be undertaken by men who have not got geological knowledge?—A. A part of the work: that is, boring. But on the whole the scheme would necessitate geological knowledge. It would be undertaken by my department or by somebody with geological knowledge.

Hon'ble Sir R. N. Mookerjee.—Q. Do the officers who go and lecture in the universities and colleges get paid for that work?—A. They get a small monthly pay in addition to their pay in the Geological Survey. They get Rs. 200 a month in Calcutta. They receive it with the sanction of the Government of India.

Q. Do you know of any other department of Government having such a system?—A. No.

Q. If the Public Works Department were allowed to lecture similarly in the engineering colleges, would it not be better for the education of the engineering students? In the Calcutta University they have railway men lecturing, that is, engineers of the Bengal Nagpur Railway?—A. I am not able to offer an opinion with regard to the Public Works Department. We have lent men to Madras and they have been definitely transferred to the Madras Education Department for a certain period.

Q. Does it interfere in any way with their ordinary routine work?—A. It is so arranged that an officer who has a considerable amount of collected material to describe is employed as curator of the museum and laboratory for a year or two. He undertakes the educational work in addition to his geological work.

Q. Who, do you consider, would be the head of the department that you say should be created specially to deal into industrial development and research in all their branches?—A. I should say a Member of Council.

Dr. G. Hopkinson.—Q. As regards teaching demands, are demands for a definite period made and then do the officers return to their ordinary status in the Geological Survey?—A. In Madras the demand is made for a definite period of three years after which the officer returns to the Geological Survey. In the case of Calcutta the officer detailed delivers lectures in addition to his ordinary work in Calcutta, and in the case of Poona the officer goes over there for three months during the recess, when he would ordinarily be employed in working out the results of his previous field-season's survey.

Q. The practical work of students is superintended by the officers of the Survey Department?—A. At present the Presidency College in Calcutta has a very good geological laboratory and museum and a demonstrator who also assists.

Q. Is he a demonstrator of the Geological Survey?—A. No. He is an M.A. of the Calcutta University. He is a member of the Provincial Educational Service. Students reading for the M.Sc. degree and those who hold research scholarship come to the laboratory and work there. The Geological Survey library has 30,000 volumes.

Q. It is probably one of the best geological libraries in the world?—A. I should think so.

Q. What is the circulation of the *Memoirs* and *Records*? Is it considerable?—A. We print 850 copies of the *Records* and 580 of the *Memoirs*. A great many of these are sold. There is a considerable number of regular subscribers.

Q. You refer to the study leave which is granted to the officers of the Geological Survey. What are the conditions on which leave is given, I mean, as regards pay and length of time?—A. Officers take leave and go home for various periods (usually for six months or more); they are given an allowance of six shillings a day and they are expected to work at some recognised institutions, generally at one of the universities, and to send in reports of their work to the Secretary of State at the end of the period.

Q. They have no roving commission to learn what they can?—A. They generally go with a definite object, for some specific piece of scientific research; but I should think that probably the Government of India would allow them to tour for special enquiries.

Q. In your paragraph on "technical aid to industries" you mention instances where Government funds were employed in assisting industries. Were those funds specially allocated for that purpose, or were they included in the budget of the Survey?—*A.* A special grant for boring operations was made to the Geological Survey for a specific purpose.

Q. Was that investigation carried out for any individuals? I do not understand in what sense the work was carried out with a view to assisting existing industries?—*A.* It was carried out not so much to assist an existing industry as to encourage a potential one. It was recognised that the copper belt was worth investigating, and it was improbable that in the existing conditions anyone in India would be prepared to put up sufficient money to investigate it; it was therefore recommended to the Government of India that they should bore in order to ascertain the value of the copper belt.

Q. In that case no person or company had an established financial interest in the matter?—*A.* No. There were companies, but not in the areas in which we bored.

Q. You mention under "general" remarks various matters which are ripe for discussion. Take the case of bauxite. Every one knows that bauxite is to be found in India in large quantities and every one knows that there are only a limited number of places in the world where bauxite is available. What is the attitude of the Geological Survey to the question of the commercial utilisation of bauxite? Do you take any steps to stimulate the utilization of bauxite?—*A.* We do all we can by means of our publications and giving information freely to encourage the creation of this and other new industries.

Q. All the information obtained is recorded and published in the Memoirs and Records?—*Yes.*

Q. Have you finished there? Have you done all that it comes within your duty to do?—*A.* I think so. We bring the matter to the notice of the public. In fact, our province is to give information and advice.

Q. You give information to any one who enquires?—*A.* Yes.

Q. But you do not go to some likely body of men and say; "Here is bauxite; it can be utilised; will you take it up"?—*A.* One does not do that officially.

Q. Supposing a Department of Imperial Research was formed and extended to commercial matters, I suppose it would be a link between your purely scientific enquiries and actual commercial development? You would hand over these problems which you mention to the Government department and it would be their business to endeavour to promote commercial development in particular provinces?—*A.* Yes. I should think so. I have not really considered that aspect of it.

Q. Such a department would probably be in closer touch with the financial interests of the country than you could be expected to be?—*A.* That would be rather beyond my province.

Mr. A. Chatterton.—*Q.* The professor of geology in Madras is not a member of the Senate of the Madras University?—*A.* I do not know. He is temporarily transferred to the Educational Department. I do not know whether he is a member of the Senate or not.
